Mr. KYLE: I must preface the answer by indicating to you that in the early years of the setting up of such a testing organization as this, I am sure you appreciate the need to acquire a number of sort of capital items. These you must sort out in terms of cost; but the average number of machines that we are presently able to test varies from about sixteen to twenty, with ten or twelve of these being in the major class and the remainder in what you might call the small machine class. The appropriation that is involved with the testing of this quantity of machines is approximately \$130,000 per year.

Mr. HORNER (*Acadia*): \$130,000 for ten machines of the major class?

Mr. KYLE: I said twelve.

Mr. HORNER (*Acadia*): In your brief you suggest there are nine agencies distributing machines. Does this mean you would take nine times twelve machines for testing?

Mr. KYLE: No. We do try to do series testing where we try to get all of the heavy duty cultivators that are on the market, for example, do a test and report on these in any one year, and so on in the different classes. Because of the early years and our organization it has been quite impossible to do this entirely, but we have made what we feel is some very significant progress in this regard. This is an objective of ours; that is, to try to do more and more series testing. A year ago we did a complete series on heavy duty

cultivators. We did these two balers, one of which you referred to. We are doing four more this year.

Mr. FORBES: Do you purchase new machines for testing?

Mr. HORNER (*Jasper-Edson*): You purchase standard ones.

Mr. KYLE: Yes.

Mr. HORNER (*Acadia*): You said you tested two balers and are going to take on four more this year. Would this be four more new models or four more of the same year's models?

Mr. KYLE: Some are the same year. Two I believe are the same year and two are new ones appearing this year for the first time. We are very careful to make sure we have them in the same class and that we are not testing a series with a group of machines as against a high capacity unit or something like this.

Mr. HORNER (*Acadia*): I have one further question on testing. You said that you did not charge a fee if the machine is on the market. I have before me an A.M.A. testing of a dual windrower swather. This is a piece of equipment which is mounted on the front of a tractor. I notice, in looking through it—and there is a picture of it on the back—the manufacturer stated that this machine is not for sale presently in Saskatchewan, but that it is for sale in the United States. In a case like that, would you charge him a fee?

Mr. KYLE: No. There is a little story that would go with this question. We allow manufacturers a very great latitude in terms of the manufacturer's comments here. We have them say just about what they would like to say. At the time this was tested it was on the market in Saskatchewan and, at the time the manufacturer's comments were received just prior to the printing of the report, they had withdrawn it from the Saskatchewan market and refunded to farmers the purchase price they paid for them.

Mr. HORNER (*Acadia*): Well, that is a very good company.

The CHAIRMAN: Are there any further questions on section 5?

Mr. SOUTHAM: Before we close our meeting, I would like to have, if it would be agreeable to the witnesses, a copy of the act authorizing the licensing of implement dealers in Saskatchewan incorporated in the record.

Mr. HORNER (*Jasper-Edson*): Is the A.M.A. the licensing authority for your dealers?

Mr. KYLE: No. It is divided into two parts; one section administers the act, and then there is the testing organization which is set apart.

Mr. SOUTHAM: Have you a separate act for your licensing?

Mr. KYLE: No, it is the same act.

Mr. SOUTHAM: Were there two separate acts?

Mr. KYLE: The only difference was that when we set up the testing, we took it out of the government department, because it was not getting the attention it should have, and we set up an independent board which administers the enforcement of the act and supervises the testing.

Mr. SOUTHAM: Does this include the dealerships to which we were referring?

Mr. KYLE: Yes.

The CHAIRMAN: Gentlemen, section 6, credit for farm machinery, follows.

Mr. HORNER (*Acadia*): I have a question on that.

Mr. PETERS: Before you leave the last section, does the witness think that this has been sufficiently successful that it would be worthwhile to make a recommendation that it be extended into the federal jurisdiction? Do you feel that this type of testing should be carried on in a larger scale, and that

the other facilities that come under the A.M.A. also should be extended into the federal jurisdiction.

Mr. NOLLET: The testing, yes, but the administration of the act is within provincial jurisdiction. I would say yes.

I think Mr. Kyle has been very modest in his replies to questions. This is one activity that has proved eminently successful and has been well received by the farmers. The benefits of it have been assured. Now, mind you, we are not doing the amount of testing we ought to be doing. We would have had more if we had had a better budget for it. We are merely starting, and the results to date show up very strongly. I would recommend that the committee very carefully consider the establishment of testing organizations. Probably three would be what would be required. We suggested two, but, perhaps, you need one in the maritimes. It would provide an invaluable service and would lead to a good deal of this interchangeability of repair parts, standardization and so on.

Mr. PETERS: Would it be advantageous to have this under our experimental farms which we have now?

Mr. NOLLET: This was a recommendation that arose out of previous inquiries in our province. However, when it was a university doing it, you did not get this kind of objective testing which we are doing. You would say to a university professor: "What do you think of this engine? It does not seem to be any damned good." He would say: "I know it, but I cannot say it." This was the rub. I had quite a time to sell the idea of an independent agency, and one which would be completely objective, highly technical and accurate while, at the same time, giving them some immunity against lawsuits for what they said.

What they said, we wanted to make sure, would be actual facts. This is the kind of organization we attempted to set up, and to date we have been successful. You have got to have highly qualified people, skilled in their own fields, and you must have the right equipment. We have put in quite a bit of money on equipment, and if any members of the committee happen to be in Regina I should like it if they would run out to our testing station and see the very delicate testing equipment there. The personnel working in it can give you the drawbar horsepower by pasting a little doodad on the drawbar, and to extreme accuracy they can do this.

There is also a special division to record stresses and strains and the figures must be very accurate. We insist upon this, and while the machines are working under actual field conditions, to compress the time which is available for testing them we have an obstacle course over which the machines are run. They really bounce them about and place about five times the amount of stress and strain on them that they would normally get in field work. As I say, I hope you will come and look at this station because this is one field where, I think, we are rendering a real service to the agricultural community.

Mr. PETERS: This is one field of questioning which does not make the Tory members mad.

The CHAIRMAN: Mr. Mandziuk on section 6.

Mr. MANDZIUK: I am looking at the brief summary which Mr. Nollet gave.

Mr. NOLLET: It is just about the same.

Mr. MANDZIUK: You say:

We urge the retention of the Farm Improvement Loans Act on a permanent basis, together with some improvements that will increase the beneficial effect of the operations of this act. We would particularly urge the elimination of the present discrimination against cooperative farms.

What cooperative farms have you in Saskatchewan?

Mr. NOLLET: There are a number of cooperative farms, but principally the farmers only have machinery cooperatives. Farmers normally pool their resources in terms of machinery but not in land. We have both kinds and apparently there is some discrimination in the act which we would like to see corrected.

Mr. HORNER (*Acadia*): Could you be more explicit?

Mr. WENAAS: Our point is that the maximum farm improvement loan which is available for a cooperative farm is the same as the maximum for an individual farmer. Therefore, for instance, if ten farmers were to get together and form a cooperative farm the maximum amount of the farm improvement loan that would be available to them would be only one-tenth of the total they would receive if they had remained individual farmers.

Mr. MANDZIUK: Do you not admit sir, that ten farmers forming a cooperative lose their identity, and the farm is only one legal entity?

Mr. WENAAS: That is what we should like to see changed in the act.

Mr. MANDZIUK: You can see our difficulty in that.

Mr. WENAAS: I can understand there are some difficulties, but they have been surmounted in other cases and I think they could be here.

Mr. MANDZIUK: Would you not have to have the ten of them each with an equal amount of land before we could give consideration to the request you are making? I could foresee legal difficulties in this.

Mr. NOLLET: Not practical difficulties—legal difficulties.

Mr. HORNER (*Acadia*): To follow up this line of questioning, would you agree with this statement that a cooperative farm does not need as much machinery as ten individual farmers? I mean roughly.

Mr. NOLLET: Yes, roughly, not to the same extent.

Mr. HORNER (*Acadia*): In other words, you would agree that ten individual farmers need more credit than one cooperative farm?

Mr. NOLLET: No—yes—but—

Mr. KYLE: We agree it does not need ten times as much.

Mr. NOLLET: This is a good field, Mr. Horner. I think we ought to encourage the smaller farmer; permit him to cooperatively buy and use machinery. This would be very helpful. Maybe there is some discrimination unintentionally.

Mr. HORNER (*Acadia*): On this very point—I own three different machines on my farm in a cooperative with different neighbours around me. We have not formed a legal cooperative—maybe this is illegal. We bought the machines and someone put it through the farm improvement loan—I am not going to say who. Each of us has maintained the maximum amount on each one of our farm improvement loans, and actually in this case three different farmers own each of those machines. We have not limited our borrowing resources because we have bought that machine in the cooperative. It is only when you have formed a legal cooperative that this becomes a legal entity, as Mr. Mandziuk, who is a lawyer, has said. It is only then that it becomes one entity and you are limiting your finances.

The CHAIRMAN: You have been a very patient and cooperative committee this afternoon. Are there any further questions before we adjourn?

Mr. HORNER (*Acadia*): I have one question on tariffs and then I am through. You suggest a tariff free entry on farm machinery, and I agree with this one, but on page 32 of the brief you say that a national agency shall be the sole importing agency of farm machinery. In order to do that would you not have to set up some sort of importing control, a tariff limitation or something? In

other words, if there was a sole importing agency in Canada and farmer Jones in Saskatchewan said: "By Jove, I can buy that tractor cheaper in Great Britain. I am going to phone my brother over there and have him send that tractor to me," under this sole importing agency this would be prohibitive, would it not, as you envisage it in your brief?

Mr. WENAAS: This would have relevance to commercial transactions, a transaction where an individual has made an arrangement with someone else.

Mr. HORNER (*Acadia*): It may be a machine dealer.

Mr. WENAAS: This would in my mind be a different category than is being referred to here. I do not think there would be any intention of interfering with this kind of movement.

Mr. HORNER (*Acadia*): Farmer Jones would be doing it in this instance, but if it were to his profit, say of \$100 or \$200, he might say to his neighbour: "I can get you a tractor because this brother of mine can get them", and the thing would spread. Would you not have to put a clamp on it if you were trying to maintain a sole import agency?

Mr. WENAAS: It is unlikely that would happen without the establishment of a system of dealerships. As has been indicated previously, it is not just enough to be able to buy this particular tractor; you have to be able to get parts and service.

Mr. HORNER (*Acadia*): I could get the same parts.

Mr. WENAAS: That would be fine.

Mr. KYLE: Massey-Ferguson make a tractor in England and they sell it here. You can see them in operation.

Mr. WENAAS: This suggestion is put forward as a possibility. It is recognized that it would be necessary to have some controls over this kind of movement, but it would not involve tariffs.

Mr. HORNER (*Acadia*): It would involve control?

Mr. WENAAS: Yes, it would involve control.

Mr. HORNER (*Acadia*): What is the difference basically between controls and tariffs? A tariff is one way of putting on control.

Mr. WENAAS: The difficulty about a tariff is that it attempts* to apply control by increasing the price to the consumer. This other type of control would be of quite a different kind.

Mr. HORNER (*Acadia*): Basically it is this—if you put on control and said I could not do this, that I could not bring in this tractor, you would not be putting on a tariff, but if I had to buy that machine or a replacement for it somewhere else at a higher price, you might as well put on a tariff. Do the two things not go hand in hand?

Mr. NOLLET: If you could not justify the agency on that basis, you should not have it at all.

Mr. KORCHINSKI: Then the sole agency ought to be done away with?

Mr. NOLLET: Actually, I did not think you fellows were so serious about this, as I am afraid now I might do it.

Mr. KORCHINSKI: This question is on transport. I do not want you to submit a brief in answer. Could you tell me how you treat all these wage increases since the end of the war, if you would not have increased the freight rates?

Mr. NOLLET: If I would not have? I am not complaining. I know there is a transportation problem. What I am complaining about is the fact that a farmer has not received compensating income to meet all these added costs.

Mr. KORCHINSKI: How would you have gone about it without increasing freight rates? How would you have made wage increases without increasing the freight rates?

Mr. NOLLET: In the case of the railways, there were signs that the economy was moving upward in an inflationary spiral. Freight rates were bound to go up when the price of steel went up, there was bound to be that reflection in the price.

Mr. KORCHINSKI: How would you go about it? In what way?

The CHAIRMAN: Before we adjourn, I would like to thank the hon. Mr. Nollet and the members of his agricultural organization for being with us here this afternoon. I may say I am sure the committee, when preparing its report, will take into consideration what has been presented here today.

The committee will meet on Monday morning in this same room, when the John Deere farm equipment company will be present, at 9.30 a.m.

APPENDIX "A"

REGULATIONS UNDER
THE AGRICULTURAL MACHINERY ACT, 1958

1. These regulations shall be construed and interpreted with reference to the terms and expressions contained in The Agricultural Machinery Act, 1958.

2. An application for a licence to sell any implement and part of an implement in the Province at a retail sale shall be in "Form I" in the schedule hereto, and an application for a licence to sell an implement repair part only shall be in "Form IV" in the schedule hereto.

3. Every licence issued pursuant to Section 9 of the Act shall be in "Form II" in the schedule hereto where implements and repair parts are being sold, and in "Form III" in the schedule hereto where only repair parts are being sold.

4. The fee for a licence in "Form II" shall be Ten Dollars (\$10.00) and shall accompany the application for a licence in "Form I" and the fee for a licence in "Form III" shall be Five Dollars (\$5.00) and shall accompany the application for a licence in "Form IV".

5. Every licence in "Form II" and "Form III" shall expire at midnight on the 31st day of March next after the date of its issue.

6. The Director may revoke or suspend any licence granted under the Act or these regulations if the licensee violates any of the provisions of the Act or its regulations and he may reinstate any such licence when the licensee fulfils all of the requirements of the Act and its regulations.

7. Every vendor shall post his licence in a conspicuous place within his place of business so that it is clearly visible to the public and it shall be produced for inspection on demand by any person.

8. Every licensed vendor shall have a current parts book in respect of each implement offered for sale.

9. (1) (a) the manufacturer or vendor of the implement tested may:

- (i) publish and distribute or cause to be published and distributed the full report without alteration.
- (ii) quote extracts therefrom which extracts have been granted prior written approval by the Director.
- (iii) disclose that the implement has been tested by the Agricultural Machinery Administration.
- (iv) add a commentary footnote to the published report of the Agricultural Machinery Administration in respect of the manufacturer's own implement but the form and wording of the footnote must be approved in writing by the Director.

(2) No person shall indicate in any advertisement or in any other manner that an implement has been recommended or approved by the Agricultural Machinery Administration.

10. The Agricultural Machinery Administration may, subject to the approval of the Agricultural Machinery Board, enter into such agreements and do such things as may be necessary to effect the testing and appraising under actual working conditions of implements sold or offered for sale in Saskatchewan.

11. The Director shall execute all agreements and sign all documents on behalf of the Agricultural Machinery Administration.

12. A person who violates any of the provisions of these regulations is guilty of an offence and upon summary conviction is liable for the first offence, to a fine not exceeding \$100.00 and, for a subsequent offence, to a fine of not less than \$200.00 nor more than \$500.00.

13. (1) Where an inspector's report indicates that an applicant for a licence has not complied with the Act or the regulations, the Director may issue a temporary licence pending the compliance by the vendor with the Act or regulations.

(2) Such licence shall expire on the date indicated therein.

14. The Director may refund the fee for a licence or a portion thereof where a licence in "Form II" is not issued.

APPENDIX "B"

1958

CHAPTER 91

An Act respecting the Sale and Testing of
Agricultural Machinery.

[Assented to April 2, 1958.]

HER Majesty, by and with the advice and consent of the Legislative Assembly of Saskatchewan, enacts as follows:

Short title

1. This Act may be cited as *The Agricultural Machinery Act, 1958*.

Interpre-
tation

2. In this Act:

"director"

1. "director" means the Director of the Agricultural Machinery Administration mentioned in section 5;

"general
provincial
distributor"

2. "general provincial distributor" means a person, company or other organization representing a manufacturer, company or person selling or offering for sale implements in Saskatchewan and responsible to that manufacturer, company or person with respect to distribution and marketing of his or its implements in Saskatchewan;

"imple-
ment"

3. "implement" means any and every implement or machine of the selling price of \$100 or more used or intended for use upon a farm, but does not include a motor truck;

"large
imple-
ment"

4. "large implement" includes traction and portable engines of any kind having a capacity of at least ten horse power for the production of power upon farms, grain harvesting machines, threshing machines, combined harvesting and threshing machines requiring for their operation an engine of ten horse power or more, engine ploughs and engine discs, engine tillage machinery, engine seeding machinery, power implements for making and handling hay, power spraying and dusting machines, power machines for the application of

fertilizer, road graders and all farm and road making machinery sold for the purpose of being operated by traction engines when used or intended for use upon a farm, and any other implement that is declared by the Lieutenant Governor in Council to be a large implement within the meaning of this Act;

"small
imple-
ment"

5. "small implement" includes grain loaders, grain drying equipment, stationary engines of any kind under ten horse power, garden tractors, farm water and sewage pumping units, irrigation equipment, dairy equipment, hydraulic attachments and any other implement that is declared by the Lieutenant Governor in Council to be a small implement within the meaning of this Act;

"vendor"

6. "vendor" means any person or company selling or offering for sale implements or parts of implements on his or its own account, or on account of a general provincial distributor, and, where the person or company resides or has its head office outside Saskatchewan, includes his or its general provincial distributor in Saskatchewan. R.S.S. 1953, c. 211, s. 2 amended.

Non-applica-
tion of Act

3. This Act does not apply to sales of implements:

(a) by farmers:

(i) by auction sale; or

(ii) in the ordinary course of their farming operations; or

(b) by an executor or administrator or any public official acting under judicial process;

or to sales of implements to persons carrying on an implement business and procuring the implements for use in that business or for resale. R.S.S. 1953, c. 211, s. 3 amended.

Application
of Act

4. Except as herein otherwise provided, this Act applies to the sale of all implements in Saskatchewan. R.S.S. 1953, c. 211, s. 4.

Agricultural
Machinery
Administra-
tion

5.—(1) There shall be an agency of the Government of Saskatchewan, which shall be called the Agricultural Machinery Administration, consisting of a permanent head, appointed by the Lieutenant Governor in Council, to be known as the Director of the Agricultural Machinery Administration and such staff, including

inspectors, as may be appointed by The Public Service Commission.

(2) The Agricultural Machinery Administration shall, subject to the direction of the board established pursuant to section 6:

- (a) administer this Act;
- (b) test and appraise under actual working conditions implements sold or offered for sale in Saskatchewan;
- (c) undertake development work to improve and develop implements for use in Saskatchewan;
- (d) publish such reports, pamphlets and bulletins as are consistent with the intent of this Act.

(3) The Agricultural Machinery Administration may, with the approval of the board established pursuant to section 6:

- (a) enter into an agreement with any department or agency of the Government of Saskatchewan or with the Government of Canada or of any province of Canada or with any university, providing for the carrying on of research or the conducting of investigations or inquiries;
- (b) carry on investigations and studies on behalf of any person or organization upon such terms and subject to such conditions as may be determined by the board. New.

Agricultural
Machinery
Board

6.—(1) The Lieutenant Governor in Council shall appoint a board, which shall be called the Agricultural Machinery Board, consisting of the Director of the Agricultural Machinery Administration, who shall be the permanent chairman, and not less than four nor more than six other members.

(2) The members of the board, other than the chairman, shall hold office during the pleasure of the Lieutenant Governor in Council for such term, not exceeding three years, as the Lieutenant Governor in Council may determine, and shall be eligible for reappointment.

(3) Vacancies in the board may be filled by the Lieutenant Governor in Council.

(4) In case of the absence of any member or the inability of any member to act or in case of a vacancy in the membership, the remaining members shall perform the duties and may exercise the powers of the board.

(5) The members of the board shall receive such remuneration and allowances as may be determined by the Lieutenant Governor in Council.

(6) The board shall meet not less than four times in each year.

(7) The board may make rules and regulations:

(a) subject to subsection (6), governing the times and places at which meetings of the board shall be held;

(b) governing the appointment of committees of the board.

(8) A majority of the members of the board shall constitute a quorum.

(9) The duties of the board shall be to govern and direct the affairs and functions of the Agricultural Machinery Administration and in the performance of its duties it shall be responsible to the Minister of Agriculture.

(10) The board may make an inquiry into the distribution and marketing of implements in Saskatchewan or into any matter relating thereto, and the board shall, for the purpose of any such inquiry, have all the powers conferred or that may be conferred upon commissioners appointed under *The Public Inquiries Act*.
New.

General
provincial
distributors

7.—(1) Every manufacturer, company or person selling or offering for sale implements in Saskatchewan shall be represented by one or more general provincial distributors within Saskatchewan. A branch of the business of any such manufacturer, company or person may be a general provincial distributor representing that manufacturer, company or person.

(2) Where such manufacturer, company or person resides or has his or its head office in Saskatchewan and has not appointed a general provincial distributor he or it shall be deemed to be his or its own general provincial distributor.

(3) Subsections (1) and (2) do not apply to a company or person that has not manufactured the implements sold or offered for sale and sells the implements or offers them for sale by retail only.

(4) Every general provincial distributor shall, within seven days after being designated as such by a manufacturer, company or person selling or offering for sale implements in Saskatchewan, file with the director a statement showing the general provincial distributor's name and the location of his or its place of business in Saskatchewan.

(5) On or before the first day of April in each year every general provincial distributor shall file with the director a statement showing the name and location of every vendor who obtains or will obtain implements from or through the general provincial distributor.

(6) Where, after a statement is filed pursuant to subsection (5), it is intended that the location of any vendor is to be changed or that any additional vendor is to represent the general provincial distributor, the general provincial distributor shall, at least five days before the change is made or the additional vendor is appointed, file with the director notice of the intended change or appointment; provided that where the contract between the general provincial distributor and a vendor is terminated, notice thereof shall be filed with the director not later than ten days after the date of termination.

(7) A general provincial distributor who fails to comply with subsection (4), (5) or (6) is guilty of an offence and liable on summary conviction to a fine not exceeding \$5 for every day during which default continues. New.

Supply of
repairs by
general
provincial
distributors

8. A general provincial distributor who fails to maintain a sufficient supply of repairs required for implements sold or distributed by him or on his behalf and in operation in Saskatchewan is guilty of an offence and liable on summary conviction to a fine not exceeding \$500 for each offence. New.

Vendors'
licences

9.—(1) No vendor shall sell any implement or part of an implement in Saskatchewan at a retail sale unless he holds a licence to do so issued to him by the director and such licence is in force at the time of the sale.

(2) If the vendor meets the requirements of this Act and the regulations the licence shall be issued upon completion of the application form and payment of the fee prescribed by the regulations and shall be signed by the director and, if required by the regulations, shall be kept posted up, in the manner prescribed thereby, in the place where the vendor carries on his business.

(3) Every vendor who contravenes any of the provisions of this section is guilty of an offence and liable on summary conviction to a fine of not less than \$10 nor more than \$500. R.S.S. 1953, c. 211, s. 5 amended.

Prohibition
respecting
sale by
vendor

10.—(1) No vendor shall sell or offer for sale an implement or part of an implement in Saskatchewan unless the implement or part is obtainable from or through a general provincial distributor representing, as required by subsection (1) of section 7, a manufacturer, company or person selling or offering for sale implements in Saskatchewan.

(2) Subsection (1) does not apply with respect to second-hand implements or second-hand parts of implements.

(3) A vendor who violates subsection (1) is guilty of an offence and liable on summary conviction to a fine of not less than \$50 nor more than \$500. New.

Lists of large
implements
to be filed

11.—(1) All general provincial distributors selling or offering for sale large implements in Saskatchewan shall file with the director on or before the first day of April in each year a list of the large implements which they offer or which they may within the following twelve months offer for sale with an illustration and description of each implement and showing in the case of engines the horse power of the same, both at the brake and on the drawbar, and in the case of implements driven or operated by engine power the amount of horse power required to drive or operate such implement.

(2) The list shall also contain the maximum price at which the implements are intended to be sold at retail, both for cash and on credit, and shall also give the usual length and terms of credit and the rate of interest charged. R.S.S. 1953, c. 211, s. 6 amended.

Lists of small
implements
to be filed

12. All general provincial distributors selling or offering for sale small implements in Saskatchewan shall file with the director on or before the first day of April in each year a list of all implements which they offer or which they may within the following twelve months offer for sale with an illustration and description of each implement and showing the maximum price at which the implements are intended to be sold at retail, both for cash and on credit, and showing also in the latter case the usual length and terms of credit and the rate of interest charged. R.S.S. 1953, c. 211, s. 7 amended.

Lists of
repairs to
be filed

13.—(1) All general provincial distributors shall also file with the director on or before the first day of April in each year a list of all repairs required for the implements sold by them, stating the maximum retail selling price thereof and the places in Saskatchewan where they may be purchased.

(2) It shall be unnecessary to include in such list standard bolts and nuts or straps or other iron or wooden parts usually made by blacksmiths or carpenters. R.S.S. 1953, c. 211, s. 8 amended.

Supple-
mentary
lists

14. In the event of any changes from time to time in matters mentioned in the lists referred to in sections 11, 12 and 13 the general provincial distributor concerned shall within thirty days after making any such change file with the director a supplementary list or lists corrected to date. R.S.S. 1953, c. 211, s. 9 amended.

Penalty for
failure to
comply with
sections
11 to 14

15. A general provincial distributor who fails to comply with section 11, 12, 13 or 14 is guilty of an offence and liable on summary conviction to a fine not exceeding \$5 for every day during which the default continues. R.S.S. 1953, c. 211, s. 11 amended.

Selling price
of implements
and repairs

16.—(1) No person shall sell or offer for sale an implement or repair at a price higher than the maximum price stated, in respect of that implement or repair, in a list filed as required by section 11, 12, 13 or 14; provided that any transportation, telephone or telegraph costs incurred in requisitioning or obtaining any repair shall not be considered part of the price of the repair.

(2) A person who violates subsection (1) is guilty of an offence and liable on summary conviction to a fine of \$25. R.S.S. 1953, c. 211, s. 12.

Supply of
repairs by
vendors

17. A vendor who fails to maintain a sufficient supply of repairs required for implements sold by him or on his behalf and in operation in Saskatchewan is guilty of an offence and liable on summary conviction to a fine not exceeding \$100 for each offence. R.S.S. 1953, c. 211, s. 13 amended.

Inspections

18.—(1) Inspectors appointed under this Act shall inspect within Saskatchewan the manufacturing of implements sold or to be offered for sale by vendors and the stock of repairs maintained by vendors and general provincial distributors and for these purposes shall during the usual business hours have free access and admission to the premises of vendors and general provincial distributors and of their agents.

(2) A vendor or general provincial distributor or an agent of either who refuses to permit an inspector to enter his premises during the usual business hours for the purposes mentioned in subsection (1) and a person who obstructs an inspector in the performance of his duties is guilty of an offence and liable on summary conviction to a fine not exceeding \$100 for each offence. R.S.S. 1953, c. 211, s. 15 amended.

Contracts
to be in
writing

19.—(1) Where an implement is sold, whether for cash or on credit, the contract for the sale of the implement shall be in writing in form A in the schedule as to implements other than second-hand implements and in form B in the schedule as to second-hand implements.

(2) Form A shall not be used for second-hand or rebuilt implements, but if such form is so used then the same shall be conclusive evidence that the implement so sold is or is warranted to be a new one.

(3) Where the provisions of subsection (1) have not been complied with the contract shall not be invalid on that account only, but all the terms and conditions of the form that should have been used shall, so far as applicable, be held to apply and to be incorporated in the contract in the same manner as if it had been reduced into writing in the prescribed form; provided that, in the case of the sale of a new implement, where the contract has not been reduced into writing and signed by the parties thereto the purchaser shall have, instead of a ten days' trial as provided in form A in the schedule,

a thirty days' trial period and he shall within the said thirty days or within two days after the expiration of the same give notice in writing to the vendor or in his absence to the general provincial distributor that the machinery does not work well, and thereupon all the terms and conditions of form A, except the limitation as to a ten days' trial period, shall apply.

(4) In such case:

- (a) if no agent of the vendor has been named to whom defective parts may be returned, such parts may be returned to the agency of the vendor at the place where the implement was purchased or, if there is no such agency, then to the vendor or to the nearest agent of the vendor;
- (b) if no place has been mentioned where necessary repairs may be obtained, the contract shall be held to contain a statement that such repairs are kept by the vendor and may be obtained at the place of business of the vendor or of the agent of the vendor who is nearest to the purchaser;
- (c) if the person to whom notice is to be given that the machine or machinery does not work well has not been specified, the purchaser may give notice to the vendor.

(5) Nothing in this section shall be construed as dispensing with the necessity of a written contract when, under *The Sale of Goods Act* or the Statute of Frauds, such an instrument would be necessary to constitute a binding contract. R.S.S. 1953, c. 211, s. 18 amended.

Contracts
to be kept
two years
and produced
on request

20. Every vendor shall keep one copy of every contract for the sale of an implement entered into by him for at least two years and shall, upon request of an inspector appointed under this Act, produce the same and allow such inspector to make copies thereof. R.S.S. 1953, c. 211, s. 19.

Application
of sections
22 and 23

21. Sections 22 and 23 apply only to the sale of large implements. R.S.S. 1953, c. 211, s. 20.

Contracts
explained
before
signature

22.—(1) If the purchaser is unable to read in the English language the contract shall, before it is signed

by him, be read over and explained to him in a language that he understands, and in such case the burden of proving that the contract was so read over and explained to him shall be upon the vendor.

(2) An affidavit to the effect that the deponent has, within eight days preceding the taking of the affidavit, read over and explained the contract to the purchaser prior to his signature thereto, in a language which the purchaser understood, shall, upon proof of the signature of the officer before whom such affidavit purports to be sworn and that he was an officer authorized to take such affidavit, be received in evidence in all courts as *prima facie* proof of all the facts sworn to therein. R.S.S. 1953, c. 211, s. 21.

Contract not binding till signed by vendor

23. The signing of such contract by the purchaser shall not bind him to purchase the implement therein described until the same is signed by the vendor or some agent of the vendor authorized to bind the vendor and a copy thereof is delivered to or deposited in a post office addressed to the purchaser, postage prepaid and registered. R.S.S. 1953, c. 211, s. 22.

Payment to vendor's agent deemed payment

24. A purchaser of farm machinery may make any payment, whether due under the contract or under any note given thereon, to any sales or collection agent of the vendor in Saskatchewan, and receipt of such payment by such agent shall be deemed to be receipt by the vendor:

Provided that the vendor may from time to time notify the purchaser in writing of the name and address of one or more persons to whom such payments may be made, and thereafter all such payments shall be made to such person or persons. R.S.S. 1953, c. 211, s. 23.

Lien note for unpaid purchase money

25. The vendor of an agricultural implement shall have a lien upon the same for the unpaid purchase money only in the event that such lien is specified in a lien note taken for the purchase price or balance of the purchase price thereof. R.S.S. 1953, c. 211, s. 24.

Effect of lien note

26.—(1) Where the vendor takes a lien note and complies with the provisions of section 5 of *The Conditional Sales Act, 1957*, the property in and title to the

implement shall remain in the vendor until full payment of the purchase price. The purchaser shall have the possession of and the right to the use of the implement, but during such possession and use the implement shall be at the risk of the purchaser as to damage and destruction from any cause, and in the event of its damage or destruction the purchaser shall remain liable for the full purchase price of the same.

(2) Upon default in payment of an instalment of the purchase price the vendor may take possession of the implement, subject to the provisions of *The Limitation of Civil Rights Act*.

(3) If the purchaser absconds or permits the implement to go out of his possession to a third party without the consent of the vendor, the vendor may take possession of the implement.

(4) Upon repossession of the implement the vendor shall be entitled to deal with the same thereafter as he sees fit without being liable to account to the purchaser in any way, save as is provided by sections 27 and 28. R.S.S. 1953, c. 211, s. 25 amended.

Repossession
and sale of
small imple-
ments

27.—(1) Where the vendor repossesses himself of a small implement, the sum for which the vendor shall be liable to account to the purchaser shall be the amount obtained upon resale of the implement, which resale may be either by public auction or private treaty, less the reasonable expenses of obtaining repossession, of making necessary repairs, of paying for freight and of reselling.

(2) If, after the vendor has given credit for the proceeds of resale, there remains a balance outstanding to the credit of either party, the person entitled to such balance may forthwith sue for and recover the same in any court of competent jurisdiction. R.S.S. 1953, c. 211, s. 26 amended.

Procedure on
repossession
of large
implements

28.—(1) In the case of the vendor repossessing a large implement, the implement shall, in the event of the vendor and purchaser being unable to agree upon the value of the same, be appraised forthwith by two arbitrators, one to be appointed by each party and a third arbitrator to be appointed by the other two, and

the amount of the value placed upon the implement by agreement or by the arbitrators shall be credited to the purchaser and shall be deemed to be paid by the purchaser to the vendor, and in determining the liabilities of the parties to each other after the afore-said repossession account shall be taken of any sum left owing by the one to the other after the crediting of the said amount to the purchaser.

(2) The value to be placed upon the implement by the arbitrators shall be its value at the place of repossession.

(3) In determining the value to be placed upon the implement the arbitrators shall make allowance in favour of the vendor for any sum that they deem reasonable to cover the costs necessarily incidental to a resale; provided that the said amount shall not in any case exceed ten per cent of the actual value of the implement.

(4) If upon the taking of an appraisalment, as herein provided, any amount remains outstanding to the credit of either the purchaser or the vendor, the person entitled to such amount may forthwith sue for and recover the same in any court of competent jurisdiction.

(5) The provisions of *The Arbitration Act* apply to arbitration proceedings under this section.

(6) If the purchaser has left the province or cannot readily be found for purposes of service, and it is desired to proceed to arbitration, the vendor may apply *ex parte* to a judge of the Court of Queen's Bench for an order directing the manner in which notices and other documents in the arbitration proceedings may be served upon the purchaser.

(7) Such application shall be made upon affidavit of the vendor or his agent setting forth the circumstances giving rise to the arbitration, stating that the whereabouts of the purchaser is unknown, and showing what efforts have been made to ascertain it.

(8) If it is made to appear to the judge that the whereabouts of the purchaser is unknown, after all reasonable efforts to ascertain it have been exhausted, the judge may order that all notices and other papers required to be served in the arbitration proceedings may be served by advertisement or otherwise, subject to such

terms and conditions as are necessary to protect the purchaser from injustice. R.S.S. 1953, c. 211, s. 27 amended.

Liability of
original
vendor

29.—(1) Where the purchaser of an implement, other than a second-hand or rebuilt implement, buys the same from a vendor who is not the maker thereof, the person or company who or which sold the implement to the vendor and the general provincial distributor representing that person or company shall be under a liability to the purchaser to observe, keep and perform the warranties numbered 1, 2, 3 and 4 in form A; and the purchaser may maintain an action against any such person or company or general provincial distributor, as well as against the vendor, or against any one or more of them, for any breach of any such warranty.

(2) The person or company who or which sold the implement to the vendor and the general provincial distributor representing that person or company shall, subject to any contract made between the vendor and such person or company and to any payment made by the vendor in respect of such implement, be entitled to be fully indemnified by the vendor against all liability imposed under this section; and in any such action by a purchaser against the person or company who or which sold the implement to the vendor or against the general provincial distributor, the party against whom such action is brought may as a matter of right add the vendor and any party to whom any note given in connection with the sale of the implement, or the moneys payable thereunder, may have been assigned or delivered as third parties, to the end that the rights of all parties may be determined. R.S.S. 1953, c. 211, s. 28.

Purchaser's
right to
reject

30. Where the purchaser purchases several large implements at the same time from the same vendor, whether by one or several orders, and it is reasonably apparent that the several implements were intended to form part of the one outfit, then and in every such case the purchaser may, upon the happening of any event that under this Act and the forms in the schedule hereto would give him the right to reject any one of the said implements, reject all of them. R.S.S. 1953, c. 211, s. 29.

Earnings of
large
implement
assigned

31.—(1) No assignment of the earnings of a large implement shall be acted upon until the vendor or his

assignee delivers to the purchaser and to the person for whom the work is being done a notice in writing that he claims such earnings. Upon the delivery of such notices, then, subject to the provisions of *The Thresher Employees Act*, twenty-five per cent of the earnings of the implement in the particular piece of work or contract for which the notice has been given, shall belong absolutely to the vendor in preference to all other charges or claims by assignment, garnishment or otherwise howsoever. The vendor shall not be entitled to any further portion of the said earnings. The vendor may give one notice to the purchaser covering an entire season, or a portion thereof, which shall have the same effect as if notice were given for each particular piece of work or contract during such season or portion of a season.

(2) If the machine is a threshing machine the vendor shall to the extent of his interest in the earnings have the same lien upon any grain threshed as the thresher would have under *The Threshers' Lien Act* and may sell the same to realize the amount due thereon.

(3) If the earnings are produced jointly by two or more implements sold by different vendors who have given the notices provided herein, the said twenty-five per cent shall be divided among them *pro rata* according to the price of the implement sold by each of the said vendors. R.S.S. 1953, c. 211, s. 30.

Net amount
credited to
purchaser

32. The net amount received by the vendor or the amount which he should have received but for his negligence less in each case his reasonable expenses of collecting the same shall be forthwith credited to the purchaser. R.S.S. 1953, c. 211, s. 31.

Contracts
to comply
with Act

33.—(1) No contract, order or security made or taken in connection with the sale of agricultural implements shall contain any statement to the effect that the vendor is not responsible for the representations of his agent or any other language in any wise limiting or modifying the legal liability of the vendor as provided in this Act or in the forms in the schedule hereto; and the insertion of any such statement or the use of any such language shall be of no effect.

(2) Any breach of the provisions of this section shall render the contract, order or security void at the option of the purchaser. R.S.S. 1953, c. 211, s. 32.

Effect of
clerical
errors
in contract

34. No error of a clerical nature or in an immaterial or non-essential part of any written contract under this Act invalidates the same, unless in the opinion of the court or judge before whom a question relating thereto is tried such error has actually misled some person whose interests are affected by the contract. R.S.S. 1953, c. 211, s. 33.

Contract
is entire
contract

35.—(1) Where a contract is made in form A or B and the form is duly completed, the same shall be taken and held to be the entire contract between the parties.

(2) Notwithstanding subsection (1), every purchaser of an implement shall, upon breach of any term of the agreement for the sale of the implement, whether or not the same is in form A or B, be entitled to the damages to which a buyer of goods is entitled under *The Sale of Goods Act*. R.S.S. 1953, c. 211, s. 34.

Validity
of forms

36.—(1) The words in parenthesis in forms A and C in the schedule to *The Farm Implement Act*, being chapter 199 of *The Revised Statutes of Saskatchewan, 1940*, and in any *Farm Implement Act* theretofore in force, and in forms A and B in the schedules respectively to *The Farm Implement Act, 1949*, and *The Farm Implement Act*, being chapter 211 of *The Revised Statutes of Saskatchewan, 1953*, and in the said forms as amended, and in forms A and B in the schedule to this Act, were and have always been and are directory merely and need not now be nor need they ever have been printed or written in any contract made pursuant to the said Acts and amendments thereto, and where any paragraph or paragraphs of the said forms governed by a parenthesis, are or were inappropriate to any particular contract according to the directions contained in the said parenthesis, such paragraph or paragraphs need not now be nor need they ever have been printed or written in any such contract.

(2) Slight deviations from the forms prescribed by this Act, not affecting the substance of the forms or calculated to mislead, shall not vitiate or invalidate such forms. R.S.S. 1953, c. 211, s. 35 amended.

Expendi-
tures

37. Sums required for the purposes of this Act may be paid from moneys appropriated by the Legislature for such purposes. New.

Annual
report

38. The Agricultural Machinery Board shall make and submit to the Minister of Agriculture an annual report respecting the work performed by the Agricultural Machinery Administration and such report shall be laid before the Legislative Assembly within fifteen days from the commencement of the session next following the end of the year for which the report is made. New.

No liability
for things
done under
authority
of board

39. No member of the Agricultural Machinery Board or of the staff of the Agricultural Machinery Administration shall be liable to any civil action or to prosecution, arrest, imprisonment or damages by reason of any statement made, report published or act done under the authority of the board acting within its powers. New.

Regulations

40.—(1) For the purpose of carrying into effect the provisions of this Act according to their true intent, the Lieutenant Governor in Council may make such regulations not inconsistent with the spirit of this Act as are considered necessary or advisable.

(2) Without limiting the generality of subsection (1), the Lieutenant Governor in Council may make regulations:

- (a) prescribing the form and contents of applications for licences to be issued to vendors under this Act and for renewals of such licences, the form of licences, the conditions to which licences shall be subject, their duration, and the fees payable for licences and renewals of licences;
- (b) prescribing the standards to be met by licensed vendors with respect to repair and service facilities;
- (c) defining the tests and examinations to be made with respect to implements and the methods and procedures to be adopted in the making of such tests and examinations;

- (d) respecting the publication and furnishing of information to manufacturers, general provincial distributors and their agents and to the public as to the results of any test or examination of an implement. R.S.S. 1953, c. 211, s. 36 amended.

Rev. Stat.
c. 211
repealed

41. *The Farm Implement Act* is repealed.

Coming
into force

42.—(1) Subject to subsection (2), this Act shall come into force on a day to be fixed by proclamation of the Lieutenant Governor.

(2) With respect to all sales of implements to which this Act applies and made before the first day of July, 1958, the references to form A or form B, or to both, in sections 19, 29 and 35 shall be deemed to be references to form A or form B, respectively, in the schedule to *The Farm Implement Act*, chapter 211 of *The Revised Statutes of Saskatchewan, 1953*, and the contract for sale shall be in the said form A or form B, as the case may require, and, for that purpose and to that extent and notwithstanding the repeal of that Act, forms A and B in the schedule thereto shall be deemed to continue in force and effect as if unrepealed.

SCHEDULE.

FORM A.
(Section 19)

CONTRACT FOR SALE OF FARM IMPLEMENTS.

Dated _____, 19____,
_____, hereinafter called the general provincial
(name of general provincial distributor)
distributor, and _____, hereinafter called the
(name of vendor)
vendor, are hereby requested by the undersigned, hereinafter called the purchaser,
to ship or have available for delivery on or about the _____ day of
_____, 19____, or as soon thereafter as the vendor can do so, but
not later than the _____ day of _____, 19____, to or at
_____ in the Province of Saskatchewan, the following machinery
with usual fixtures and extras hereby now agreed to be purchased, upon which the
purchaser agrees to pay all freight and charges thereon from
to _____

On arrival of the said machinery at the point above named (or when the said machinery is available for delivery) the purchaser agrees to take delivery of the same, subject to the terms and warranties herein, (pay the freight and charges thereon) and pay the vendor for the same _____ dollars, payable as follows:

Cash \$ _____ and give in settlement lien notes bearing interest at _____ per cent per annum before maturity and at _____ per cent per annum after maturity from the date of delivery.

Note for \$	due	, 19 .
Note for \$	due	, 19 .
Note for \$	due	, 19 .
Note for \$	due	, 19 .

Payable at _____, Saskatchewan, and (where applicable) to deliver the following second-hand machinery, namely:

(Discount clause. Here fill in discount provisions, if any).

The said machinery is intended to perform the following work, namely: (insert purposes).

Repair parts except as provided for in this contract and attachments not sold as usual fixtures and extras are excluded from the warranties herein expressed.

The said machinery is sold upon the following express warranties on the part of the vendor and the general provincial distributor:

1. The vendor and the general provincial distributor warrant that the said machinery is well made and of good materials.

2. The vendor and the general provincial distributor warrant that the said machinery will well perform the work for which it is intended, if properly used and operated:

Provided, however, that if the purchaser cannot make the said machinery perform well the work for which it was intended upon a ten days' trial of the same, he shall within the said ten days or within two days after the expiration of the same give notice in writing to the vendor at _____, in Saskatchewan, or in his absence to the general provincial distributor that the machinery does not work well. If the purchaser gives such notice the vendor and the general provincial distributor shall have eight days from the receipt of such notice to make it perform well the work for which it was intended. If within the said eight days they do not make it perform well such work, either by replacing the parts or otherwise, the purchaser may either reject said machinery, in which case this contract shall be at an end and he shall be entitled to a return of any moneys paid or notes given therefor by him and the freight paid by him, or he may retain said machinery and hold them liable for the difference between the value of the machine as it is and the value it would have had if it had fulfilled this warranty.

Whether the purchaser rejects or retains the machinery as hereinbefore mentioned, he shall within the said eight days or within five days after the expiration of the same give written notice to the vendor at _____, in Saskatchewan, or to the general provincial distributor of his decision.

If within the said eight days the vendor and the general provincial distributor or either of them makes the said machinery fulfil this warranty and if the purchaser's failure to make it work well was due to improper management or want of skill in operating on his part, then the purchaser hereby agrees to pay the expenses incurred by him in making it work well, in cash forthwith, and in case payment is not so made the amount shall bear interest at the rate specified in this contract. The purchaser shall forfeit his right to reject the machinery if he fails to give either of the said notices within the time limited, unless the vendor or the general provincial distributor either before or after the expiration of the time limited for the giving of either of the said notices, does any act, or so conducts himself, as to lead the purchaser to believe that the said notices are not required to be, or to have been, given.

3. The vendor and the general provincial distributor warrant that the said machinery will be durable if used and kept with proper care. Parts proving defective in workmanship or material will be replaced free of charge for the period of one year upon the defective parts being returned to the vendor at _____, in Saskatchewan, or to the general provincial distributor.

In the event of the purchaser having to pay for any such defective parts within said period, he shall be credited with the money paid by him for the same upon any note or notes due to the vendor.

4. The vendor and the general provincial distributor warrant that all necessary repairs for said machinery, other than standard bolts and nuts or straps or other iron or wooden parts usually made by blacksmiths and carpenters, will for a period of ten years from the date of this order be kept at _____, in Saskatchewan and that at said place the purchaser will be able to obtain them within reasonable time.

The purchaser hereby agrees that he will take delivery of the machine for which this order is given at _____, and that he will settle for the same in accordance with the foregoing terms.

The purchaser hereby assigns to the vendor twenty-five per cent of all moneys which the purchaser, his servants or assigns may earn by using the same and all threshers' liens and rights to liens therefor which may accrue, with full power to exercise the same in the name of the purchaser or any such other person.

The purchaser further agrees to insure the machinery against fire in favour of the vendor as his interest may appear and, in the event of his failure to do so, the vendor may insure the same, and add the amount paid therefor to the purchase price, which shall immediately become due from the purchaser to the vendor and shall bear interest at the rate specified for the original debt.

In the event of the said machinery being seized for payment of taxes, the vendor may pay such taxes, together with any costs in connection with such seizure, and all such moneys shall be forthwith repayable by the purchaser to the vendor with interest at the contract rate from the date on which the vendor paid same, and any moneys so paid by the vendor shall be added to and form a part of the purchase money of the said machinery.

This contract shall be deemed to be made in Saskatchewan and in any action which may be brought hereunder or by reason hereof shall be interpreted and enforced according to the laws of Saskatchewan.

(If the machinery sold is a motor or if a motor forms a part of the machinery sold, the following additional warranty shall be given:)

The vendor warrants that the said machinery (or the motor forming part of the said machinery) is capable of developing _____ horse power at the belt, and (where applicable) _____ horse power at the drawbar, if properly operated under suitable conditions.

In testimony whereof the purchaser has hereunto set his hand the day and year first above mentioned.

MINUTES OF PROCEEDINGS

MONDAY, May 22, 1961.
(20)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Cooper, Doucett, Fane, Forbes, Gundlock, Hales, Henderson, Horner (*Acadia*), Knowles, Korchinski, McBain, Milligan, Montgomery, Noble, Pascoe, Peters, Southam, Stefanson, Thomas, Tucker, Ville-neuve, Webb.—(22).

In attendance: From Deere and Company: Messrs. A. B. Connell, Director of Sales Financing; J. Dain, Jr., Vice-President and Treasurer; L. Kellogg, Economist; L. Wilson, Vice-President and General Counsel, and H. Hawes, General Attorney. *From John Deere Limited:* Messrs. J. C. Trimble, Vice-President and Canadian Sales Manager; E. H. Coleman, Q. C., Counsel.

The Chairman introduced Mr. Trimble who, in turn, introduced the officials of Deere and Company and John Deere Limited.

Mr. Connell presented the brief of Deere and Company regarding farm machinery prices.

The Committee questioned the officials on the Deere and Company brief.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING (21)

The Committee reconvened at 2.47 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Belzile, Clermont, Cooper, Doucett, Fane, Forbes, Gundlock, Hales, Henderson, Horner (*Acadia*), Knowles, Korchinski, Lahaye, McBain, Milligan, Montgomery, Noble, Pascoe, Peters, Rapp, Ricard, Southam, Stefanson, Thomas, Villeneuve, Webb.—(26).

In attendance: Same as at morning sitting.

The questioning of the officials of Deere and Company and John Deere Limited was concluded.

Agreed, that pamphlet entitled "Percentage of Costs to net selling price" of tractor, combine baler, spreader and tiller of Deere and Company (see Appendix "A") and "Facts about John Deere Tractor Wholesale Prices in the United States 1935-1961" (see Appendix "B") be made appendices to this day's Minutes of Proceedings and Evidence.

Mr. Korchinski moved, seconded by Mr. Southam,

Agreed, that the financial statement of Deere and Company be made an appendix to this day's Minutes of Proceedings and Evidence (see appendix "C").

On behalf of the Committee, the Chairman thanked the officials of Deere and Company and John Deere Limited for their appearance.

At 5.00 p.m. the Committee adjourned until 9.30 a.m. Friday, May 26th.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

MONDAY, May 22, 1961.

The CHAIRMAN: Gentlemen, we have a quorum this morning. I am very pleased to welcome to the committee the officers of John Deere Limited. I will call on Mr. J. C. Trimble, vice-president and Canadian sales manager of John Deere Limited to introduce these gentlemen to you.

Mr. J. C. TRIMBLE, (*Vice-President and Canadian Sales Manager, John Deere Limited*): Thank you, Mr. McBain. Gentlemen, it is a pleasure to be here this morning at your invitation.

On my left is Mr. A. B. Connell, director of sales financing of Deere and Company; on my right Mr. Joseph Dain, junior, vice-president and treasurer of Deere and Company. Seated on the side, first of all is Mr. L. Kellogg, economist; Deere and Co.; Mr. L. D. Wilson, vice-president and general counsel for Deere and Company; Mr. Harold Hawes, general attorney for Deere and Company; Mr. E. H. Coleman, Q.C., counsel for John Deere Limited.

Mr. Connell will read our brief.

Mr. A. B. CONNELL (*Director of sales financing, Deere and Company*): Gentlemen, before I start I would like to say I am very sorry that when we sent you the brief and supplementary data that we could not send you all the information you now have before you. I hope that each of you now has the brief, the supplementary data sheets and charts, the booklet "facts about John Deere tractor wholesale prices", and then in addition the costs of the machines on a percentage basis to selling price, and then a comparison of wholesale prices. Those are the papers you should have before you.

In addition we found we had made a mis-statement on page 12. We have given you a new page 12. So that you will not have to read the whole thing to find out where the mis-statement occurred, it is in the first paragraph; it is the wording beginning in the ninth line where it says "please notice that between 1935 and 1961". That part of that paragraph is different than in the brief which you received.

This morning we hope we have submitted in this material much of which we think you wanted. I can assure you that if you do not find in here the answers to some of your questions, we shall be happy to try to answer them for you.

In going through the questions, we propose that persons in this group most conversant with the subject will be the ones who will answer them.

Now, I will start reading the brief, with your permission.

We are here today at your invitation to provide information about our company and our industry, particularly with respect to the prices of our products. Before discussing the specific subjects of your interest, we would like to tell you something about Deere & Company. Deere & Company is a United States corporation which, for a substantial part of its 124 year life, has manufactured and sold its products primarily in the United States and Canada. For many years it has sold its products in foreign markets as well but it is only recently that it has extended its manufacturing efforts outside of North America.

This background is important as a foundation for some of the data which we will use here.

One other point is important by way of preface. We will use a considerable number of U.S. data. We will do so because U.S. data generally are more recent and more readily available. In addition, we believe that the basic trends in agriculture revealed by U.S. data are characteristic of basic trends in Canada. Most of the goods which we sell in Canada are manufactured in the United States, and this is another reason why U.S. data are relevant, particularly those data concerned with our costs and related items. It should be kept in mind in using these data that they relate to the Deere organization in the United States and Canada and not just to that portion of it which operates in Canada. This must necessarily be the case since, as we have stated, most of the goods sold in Canada are manufactured in the United States, although we have had for years a manufacturing plant at Welland, Ontario, which in turn exports most of its products to the United States.

I would like to remark on the side, here, that of the Welland production 65 per cent is exported to the United States, 30 per cent is sold in Canada and 5 per cent is exported to countries other than the United States.

Now we would like to give you some figures indicating the extent of the business done by the John Deere organization throughout the world. In 1960 worldwide net sales were \$510 million. Of this total, \$405 million or 79 per cent were sales within the continental limits of the United States; \$39 million or 8 per cent were sales within the Dominion of Canada; \$15 million or 3 per cent represented goods manufactured in the United States and Canada and exported; and \$51 million or 10 per cent represented goods fabricated by our foreign plants and sold outside the United States and Canada. None of the goods produced in any of our foreign plants was brought into either the United States or Canada.

Looking specifically at Canadian agriculture, annual expenditures for farm machinery and tractors, which have ranged from \$180 to \$250 million per year for the last five years, represents from 7 to 9 per cent of Canadian cash income from the sale of farm products and supplementary payments. This percentage has varied only moderately for many years.

Next, we want to summarize some important aspects of the way our industry must operate. Contrary to popular belief, ours is not a mass production industry as many people are accustomed to thinking of mass production. A glance at Data Sheet No. 1 in the supplement provided for you shows how the production volume of a few of the more costly farm machines produced by our entire industry in the United States in 1960 compared with the U.S. production of only two major makes of automobiles. In 1960 the number of wheel tractors produced by our industry was only about 8 per cent of the number of Chevrolets and Corvairs or the number of Fords, Falcons and Comets produced that year by two mass production manufacturers. Total industry production of crawler tractors, combines, corn pickers, hay balers and forage harvesters was also very small in comparison with Chevrolet and Ford production.

Total farm machinery production is the output of many companies. When you divide these unit production figures among ten or eleven major companies and over a thousand smaller ones, it is obvious that real mass production opportunities for any one company in the United States or Canada are severely limited. This is even more apparent when it is considered that in our company alone we offer for sale more than 8,700 different machines and attachments. Many of these pieces of equipment are needed to adapt basic machines to a wide variety of farming conditions in thousands of combinations in many different locations on our continent. We are in a constant dilemma between trying to reduce costs by producing a greater volume of standard machines on one hand, and responding to constant pressure from farmers on the other hand to adapt these basic machines to local needs.

Again I would like to digress just a little bit from the brief, and explain that the many attachments and the various kinds of machines we make are not machines that we make capriciously at all. It is simply that they come as the result of the demand by farmers for a particular machine or some attachment for a machine to better adapt that machine to particular operations. I have brought with me as an example just a few of the many hundreds of requests we receive annually from the users of our machines asking us to do something different from what we are already doing.

I thought that might be of interest to you at this point.

Another characteristic of our industry is that it does not enjoy the advantage of producing to fill orders. Most farm machines are used only at certain definite times of the year. Farmers buy machines only a short time before use seasons. For machines to be available for the farmer on time we must buy materials, produce the machines and store or ship them months ahead of the use season. We must produce to fill not actual orders on hand but orders we and our dealers estimate we will receive from farmers. This is risky business and is subject to many things over which we have no control, such as droughts, floods, crop failures, pests, diseases, etc.

Manufacturers in our industry must build up large inventories of machines ahead of use seasons so farmers can be properly served. In the case of our company these inventories are shipped to our dealers under a consignment arrangement under which the dealers need not pay for the machines until they are sold to the farmer.

Many farmers buy their machinery on credit. Adequate financing for this purpose has not always been readily available in sufficient amount to farmers. As a consequence we have had to fill this need and this has required large amounts of capital. We have been extending credit to farmers for 42 years.

Again I would like to interrupt the reading of the brief to mention this, that for the last two years our company has financed 29 per cent—or just a fraction above that, 29.2 or 29.3 per cent—of all the goods sold by our dealers.

We recognize that up here you have the Farm Improvement Loans Act which, in our opinion, is doing a wonderful job. Unfortunately, the \$7,500 limit placed on the farmer as the maximum, many times is not sufficient to take care of his needs when it must be considered that the \$7,500 has to cover all his needs. We are in there to fill the gap when the maximum is not enough.

As to our finance charge, I would like to explain it this way: if a machine were to be purchased and we would be asked to finance \$1,000 over 12 months, and he would pay us off in 12 equal monthly instalments, we would charge the purchaser \$53.60. We could say that that is a rate of approximately 5.4 per cent; but if I told you that, I would be wrong. In terms of simple interest it comes out to 9.95 per cent. That is our rate of interest.

Many times you will hear finance companies talk of a 6 per cent and 7 per cent rate but, gentlemen, you must remember that that is what is figured on the balance at the beginning, and not on the declining balance. If someone were to charge \$60, let us say, for a 12-month period, to be paid off in equal monthly instalments, the rate would be 11 per cent in terms of simple interest.

I thought that information might be helpful as to what our rates really are. They are not 5.3 per cent or 5.4 per cent; they are 9.95 per cent simple interest.

So much for the background. Now we want to turn to prices. This committee has heard much testimony that farm machinery prices have increased substantially in recent years and that this has worked a hardship on many farmers. This is all too true. We are well aware of it and it is a matter of very great concern to us.

This brings us to the last of our four principal points: how the changes in farm machinery prices relate to the changes in prices of farm products and the changes in the prices farmers pay. During the course of these committee meetings you have heard several times that today it takes a considerably greater number of bushels of wheat to purchase various pieces of machinery than it did some years ago. We know that, in general, the conclusion is true. We believe it is also true in most instances where a basic commodity requiring relatively small amounts of labor for its production is exchanged for a manufactured product requiring relatively large amounts of labor to produce it.

This situation is reflected in data sheet No. 8 which shows that in the U. S. wholesale prices of relatively important raw materials—those requiring small amounts of labor to produce—have risen much less than the prices of products which require larger amounts of labor per unit. Notice, for instance, that wholesale prices for raw lumber rose only 6.0 per cent between 1950 and 1960. Fertilizer prices increased only 9.6 per cent, and electric light and power rose only 10.5 per cent. Wholesale prices for farm machines and tractors which require considerably more labor have risen 33.5 per cent. Motor trucks which have been 80 per cent as important as tractors in farmers' capital expenditures in the last four years, have risen 32.8 per cent. Hardware, which includes such farm tools as shovels, hammers, forks, building hardware, etc. has risen 52.6 per cent. Notice also that wages paid for hired farm labor have risen 48.5 per cent since 1950, and taxes per farm acre have risen 67.5 per cent. It is clear from the chart and the table that prices for farm machinery and tractors have risen in the last 10 years, but they have risen substantially less than a number of other major expenditures required of farmers.

Much as we regret this situation, its causes are far beyond our control. They are beyond the control of any one company or industry. Nevertheless, we have worked hard to minimize its effect. Simple logic should make it clear that the last thing Deere & Company wants to do is to price itself out of the farm machinery market. We have shown you how our profits are considerably less than ten years ago and how our total employment costs per dollar of sales have increased substantially less than the increase in our wage rates. Such improvement in efficiency does not happen without strenuous effort.

Farm machinery is not a luxury item for the farmer. It serves the same function for him as the machine tools in our factories serve for us—it is his most productive capital. In both cases the basic tests in deciding whether or not to buy a new machine are these: the amount of capacity needed, work capacity per dollar of price, and the cost of doing the same amount of work with more labor and less machinery.

We believe that farmers themselves are the best judges of the work capacity they need in their farm machinery. They tell us their decisions through the sizes of machines they buy. Greater work capacity permits a farmer to do one or a combination of two things: work more acres per hour and per day, or to work the same number of acres in less time, thereby reducing exposure to one of his major risks, bad weather. Sometimes the availability of greater than normally needed work capacity means the difference between a crop and no crop at all. In such cases the value of the greater capacity is equal to the value of the entire crop.

Work capacity of farm machines is difficult to measure because it differs according to weather and soil conditions and varieties of work being performed. The best measure, for instance, of a tractor's capacity is horsepower. Frequently attempts are made to express capacity and prices of machines in terms of bushels of wheat. Such measures fail to take account of the increases of productivity which are provided by the machines. A much better measure of

price, in terms of machine capacity to work, therefore, is savings of man-days of labor, as shown in data sheet No. 9. The price of a 1960 John Deere tractor compared with a 1950 tractor of approximately the same horsepower has declined 15 per cent when expressed in number of man-days of labor required to buy the tractor. On this same basis the price of a plow increased 8% in man-days, but the baler decreased 26% in man-days. In addition, the 1960 baler is a much more efficient and productive machine. In planning his capital expenditures, every farmer must take all of these various factors into account in order to get maximum return for his various resource inputs. In recent years when farm labor has been one of the most costly resources to obtain, consideration of machine prices in man-day labor equivalents is most significant.

Much of our presentation today can be summed up and perhaps emphasized by tracing the wholesale prices and product improvements of one of our John Deere tractors over the years. The information to which I shall refer is contained in the booklet before you, "Facts About John Deere Tractor Wholesale Prices." The booklet presents in considerable detail the story of a specific series of John Deere tractors. This series began as a model B in 1935 and became the Model 2010 late last year.

The wholesale price of the original 1935 Model B tractor was \$733 including rubber tires, electric starter and lights, and a two-piece front pedestal, had all of these items then been available. These items and many other new ones are now part of the standard equipment on Model 2010 tractors. If no change had been made in the original Model B so equipped, it would have to be priced in today's dollars at \$1644 because of the decline in the purchasing power of the dollar. The present wholesale price of the Model 2010 tractor with like equipment, successor to the model B, is \$2122 or only 29 per cent more than the model B's original price 26 years ago stated in terms of current dollar values. But this 29 per cent increase in real prices has been accompanied by a 215 per cent increase in drawbar horsepower, a 168 per cent increase in belt horsepower, and an 87 per cent increase in weight. We call your attention especially to the "summary comparisons" which appear at the lower right hand corner of the next to the last printed page of the booklet. Please notice that between 1935 and 1961 the cost per drawbar horsepower declined 59 per cent in real dollars and during the same period the cost per pound of the tractor declined 31 per cent in real dollars. However, in current dollars, the cost per pound of the tractor increased from 30¢ to 46¢ or 53 per cent, while the wholesale price of iron and steel in the U. S. as reflected by the U. S. bureau of labor statistics index of wholesale prices increased nearly 200 per cent.

The model 2010 tractor can do much more work than the original model B—oftentimes double or more. It can pull three 14 or 16 inch plow bottoms compared with the model B's one 16 inch plow bottom. The model 2010 can pull a 9-foot *double-action* disc harrow as against the model B's 10-foot *single-action* disc—nearly double the amount of work. The model 2010 can plant or cultivate four crop rows at a time instead of the model B's two rows.

Changes made in the model B during its transition to the model 2010 tractor have been such that it is now more than the equivalent in belt horsepower of the model G, the largest row crop power size in our line only ten years ago, and is only about \$100 higher in price.

These comparisons show as plainly as anything can that, horsepower size for horsepower size, our wholesale tractor prices have increased very little in recent years.

Now, I would like to get away from the brief and refer you to the group of papers which you have, starting with the one headed wholesale prices versus

maximum PTO horsepower. The purpose in presenting you gentlemen with these sheets is simply to show you the wide range of prices which a farmer has when he goes out to purchase a tractor or any other machine.

As an example, on this first one, in the bottom line is the horsepower and then at the left-hand side, reading up, are the dollars. If you look over to the point where it shows approximately 50 horsepower you will find that there are several tractors in there which the man can buy. Incidentally these tractors all are equipped pretty nearly alike—as nearly alike as we can make them.

Mr. HORNER (*Acadia*): Is this drawbar horsepower or belt horsepower?

Mr. CONNELL: Belt horsepower—PTO horsepower. There are four or even five tractors there from which he can select. He does not have to pay the highest price. He pays a higher price for some tractors because he may like something about that tractor; there might be a comfort feature which he likes or some other functional feature. He is willing to pay for that. In the industry we do not have only one tractor price for the same kind of tractor.

Glancing over at the next pages you will see tricycle diesel tractors and tricycle gas tractors. On page 4 there is one in which you are not interested—cottonpickers; but over on the left hand side you will see cornpickers, and in certain areas perhaps these are quite important. If you look at the grey shaded area above you will see the range of prices of the various products. It shows that in respect of the machines which supposedly are comparable in quality and do the same kind of job there is really no relation at all in price. They are in the same general area, but as to individual machines they differ in price.

On the last page we have combines and forage harvesters. You will see the same general situation prevailing there. There is really nothing in the way of a set price for any machine; the range is too great for that.

I wanted you to have this information because I thought it would be of interest to you.

I would like to mention one other sheet, because the next paragraph of the brief is the concluding remarks. As you will recall when we were here back in the early part of May, you wanted some information concerning the cost of our various machines. We have given you the cost of a tractor, a combine, a baler and a spreader. We have also given you the cost information percentage-wise on a tiller, because that is a machine made in our Welland plant. None of the other machines were produced in Canada. We wanted you to have one based on our Welland plant. I think you will find that this is made out in the way in which the committee asked. I hope that it will be of some help to you.

In conclusion, may we say that all of us at Deere & Company are concerned about the problems you have been hearing about from farmers and their representatives. They are not new problems. Aside from a few exceptional periods they have been chronic ones during the 124-year history of our company. No one is more interested in having agriculture prosper than we are. Our livelihood depends upon it. We would like to stay in business for at least another 124 years, so if we could leave only one thought in your minds out of the great number of facts and figures we and others have given you it would be this: John Deere people are acutely aware that the surest way to work against their own best interests is to overprice their products or to deliberately reduce quality or service.

(Editor's Note: The following are the supplementary data sheets and charts:)

DATA SHEET NO. 1

COMPARISON OF PRODUCTION OF SELECTED FARM MACHINES
WITH PRODUCTION OF CHEVROLET AND FORD AUTOMOBILES
IN THE U. S. A.

	Total 1960 Farm Machinery Production (units)	Farm Machinery Production as a Percent of 1960 Automobile Production

Mr. CONNELL: Thank you, gentlemen.

The CHAIRMAN: Thank you, Mr. Connell.

Gentlemen, the meeting is now open to questioning.

Mr. HORNER (*Acadia*): My first question arises out of the set of tables which were distributed this morning with regard to what goes into making up the different costs of production in the various machines listed here. I notice in 1955 in respect of tractors that approximately seventeen per cent of the cost of making a machine was contributed to by either salary or weekly wages, but in 1960 this rose to thirty-five per cent. In your brief I believe you said something about the greater the labour component going into a machine the higher the rates. In your own figures here you will notice the labour component going into a tractor has doubled in those five years, lumping salaries and weekly wages together. Going back to the tiller, on the last page of the pamphlet, I notice that lumped together salaries and weekly wages in 1954 totalled nineteen per cent. I am figuring roughly here, but in 1960 again you have nineteen per cent. In other words in that period the labour component has remained relatively the same, whereas in respect of the tractor it has doubled. My question is this: how have the various prices in these commodities increased? Has the price of a tractor gone up faster in this period of years than, for example, a tiller?

Mr. CONNELL: I will have to answer this without having the full price information before me; but to the best of my knowledge and in my opinion there has not been a greater increase in tractor prices, shall we say, than in tillers, unless, as we did in 1960, introduce a completely new line of tractors. You were referring to the labour content in 1960. That was during the period of our change. I would like to go back to a more normal year and take 1959. In 1960 our plant was closed down for about five months.

Mr. HORNER (*Acadia*): I see that now.

Mr. CONNELL: We had terrific costs going on without producing tractors. I think you can appreciate that our costs would go up. Therefore I would suggest you look at the figures for 1959 instead of 1960.

Mr. HORNER (*Acadia*): Yes. The labour component in 1959 was not much higher than in 1955.

Mr. CONNELL: That is right. 1960 was an unusual year in respect of our tractors.

Mr. HORNER (*Acadia*): While I am on this subject, could you tell the committee what you mean by salary and weekly wages?

Mr. CONNELL: When we speak of plant labour, we are speaking of the total cost including fringe benefits. It is simply those who are on a weekly payroll and those on a salary payroll.

Mr. HORNER (*Acadia*): There would be no connection in respect of salary being more of an administrative type of labour and the weekly payroll being more of the actual production type of labour?

Mr. CONNELL: No. The administrative side of this would get down into the distribution where we have selling and general expense. I think it is referred to here as distribution expense. When we list the salaries plus wages and all fringe benefits we should combine plant labour and also combine distribution.

Mr. HORNER (*Acadia*): When there is an increase in salaries such as in the year 1960 are we to believe that all you are doing here is placing more and more men on a salaried basis every year? Would this be a proper assumption to draw from these statements?

Mr. DAIN: Generally speaking, Mr. Horner, over the past ten years the proportion of our total employment paid in the form of salaries has increased.

Mr. HORNER (*Acadia*): Just to follow that up, this would lead to the belief that the salaried person would be more permanent than, say, someone hired on a weekly or hourly basis. Would this be a proper assumption?

Mr. DAIN: It is a little difficult to distinguish because many union contracts, as you know, have security provisions in them that make lessened difference in cost between the continuity of employment for hourly people and salaried people. This difference is much less than it used to be.

Mr. HORNER (*Acadia*): But why would this change be made? Why would the increase be from weekly to salary? Why would the company prefer to increase the amount of salaried people?

Mr. DAIN: You really have to take that in two parts: Part of it relates to our efforts to reduce the labour cost per unit. This increase is necessary because of the rapid increase in hourly wages in the past ten years. To some extent we have been able to offset this by increasing our capital investment in machine tools, for instance, which increases our capital cost and decreases the labour cost. The increase in complexity of the business in terms of the number of machines we produce, the professional requirements such as those in various service departments, the time we have to spend on compiling statistics—all these requirements have increased substantially faster in the last ten years than they have previously. This requires more people to take care of this kind of service. We have not been as successful in controlling our total employment in this area as we have in the factory, let us say.

Mr. HORNER (*Acadia*): But I was lead to believe, sir, that in plant labour this other type of professional help, such as statisticians and economists, et cetera, would come under "other expenses" in the distribution. Here I am referring to "plant labour". Particularly in this item here, you have a relatively general increase in the amount of labour on a salaried basis.

Mr. DAIN: Plant labour, Mr. Horner, as far as the salaried payrolls are concerned, would include not only the clerical people, but would include all the salary payroll in our plant,—not just that related to production. It would also include the accounting people, sales force, the engineers and that sort of thing.

Mr. HORNER (*Acadia*): But the salaried people you are referring to here would be organized?

Mr. DAIN: No.

Mr. HORNER (*Acadia*): And then there is a definite split here—the weekly people would be organized labour and the salaried people would not be organized.

Mr. DAIN: Not entirely. You would find some plants where they would not.

Mr. HORNER (*Acadia*): But generally speaking?

Mr. DAIN: Generally speaking, yes.

Mr. HORNER (*Acadia*): I have further questions, Mr. Chairman, but I will let someone else ask some.

Mr. FORBES: Do you have much of your work done on a piece-work basis, or is it on an hourly basis?

Mr. DAIN: All the productive labour is done on a piece-work basis, yes.

Mr. HALES: In this weekly and plant labour salary between 1956 and 1957, you show a decrease of 4 per cent. From 1956 to 1957 you went down. How would you account for that?

Mr. DAIN: May I be sure which figures you are referring to? This is the tractor sheet you have?

Mr. HALES: Yes. In the sheet in 1956 and 1957 when you add the two, plant labour between 1956 and 1957, you drop 4 per cent in your labour costs.

Mr. DAIN: Yes, sir; 1956 is another distorted year because we had a 13-week strike in most of our plants during that year, so the costs were unusually high.

Mr. KNOWLES: I had a question in respect of the labour costs. I note in some of the labour magazines that they claim that the cost increase because of labour is not as great as some of the machine companies say, because they say their output is so much greater; so actually the labour cost is not as high and it is in some cases almost cut in half. I wondered what your argument was in connection with that?

Mr. DAIN: You have to look at that in two ways. There are actually two components in labour costs: one is direct labour of machine operators and men on the assembly line, for instance. Their statement has some validity with reference to those people. But as far as our company is concerned, and as far as the customer is concerned, you have to look at total labour costs for all the people required.

Now, as the number of people—let us call them direct labour—decreases over the years, it requires some increase in what we would call indirect labour. That is, people who transport materials in the plant, shipping, machine repairmen, and that sort of personnel. Thus, as the number of machines and the complexity of operation increases, it takes more people, and for that reason much of the gain we are able to make on direct labour is offset by increases in the other categories.

Mr. SOUTHAM: I have another supplementary question: We discussed a particular labour problem which you mentioned a moment ago, that over the last number of years you have had to increase your labour force, technicians, engineers, et cetera. I presume this was to enable you to run your business more efficiently. Have you pro-rated this increase to the over-all cost of your business, and how does it affect the total increase in cost per unit? Has it increased the cost per unit, or has this increase in efficiency tended to decrease the over-all cost to the producer of machines?

Mr. DAIN: The increase in efficiency, I would say, has tended to offset this factor somewhat. Where the balance is, is very difficult to say, but one offsets the other to some extent.

Mr. KORCHINSKI: I wonder if you would be prepared to give us the total, indicating the increase or decrease in staff from 1955 to 1960? Would you be prepared to give us that type of information?

Mr. CONNELL: We do not have that information with us, unless Mr. Dain has.

Mr. DAIN: I have it for the entire company in the United States and Canada.

Mr. KORCHINSKI: Well, these costs are related to the entire costs in the United States and Canada.

Mr. DAIN: Yes.

Mr. KORCHINSKI: That is fair enough.

Mr. DAIN: I can give it to you beginning in 1950, if you like.

Mr. KORCHINSKI: The more the merrier.

Mr. DAIN: I do not have it prepared. I can read it. If you would like to take these figures down, this is the total employment or number of people in Deere & Company for the United States and Canada, combined. I will read three figures for each year: (1) the hourly payroll; (2) the salaried payroll, and (3) the total.

Beginning in 1950 there were 17,687 hourly people, 7,419 salaried—a total of 25,106.

In order not to read too many figures, I will skip a number of years to 1955. In that year there were 14,083 hourly, 7,403 salaried, making a total of 21,486.

In 1960, 16,560 hourly employees, 8,907 salaried, making a total of 25,467. If you would like more years, I can read those to you.

Mr. KORCHINSKI: This is all right, except I wonder if you would be prepared to submit that as part of the evidence, including the other years?

Mr. DAIN: Yes. The figures are as follows:

DEERE & COMPANY
AND CONSOLIDATED SUBSIDIARIES
NUMBER OF EMPLOYEES

	<i>Hourly</i>	<i>Salary</i>	<i>Total</i>
1950	17,687	7,419	25,106
1951	18,869	7,729	26,598
1952	17,114	7,933	25,047
1953	15,918	7,762	23,680
1954	12,519	7,301	19,820
1955	14,083	7,403	21,486
1956	12,999	7,516	20,515
1957	14,324	7,623	21,947
1958	15,629	7,800	23,429
1959	18,690	8,596	27,286
1960	16,560	8,907	25,467

Mr. KORCHINSKI: I have a question on that same page. It does not deal with labour, so if anyone else has supplementary questions, I will pass mine off.

Mr. MILLIGAN: Well, Mr. Chairman, I am not clear on 1960. I notice your increase in salaries and plant labour is 36.1 per cent, when you add them both together, against 20.6 per cent of a high in 1957. Is that all due to the changes in your plant?

Mr. CONNELL: That is due to the fact that we were shut down, had no production and produced no volume out of that plant for quite a few months, with costs going on.

Mr. MILLIGAN: In 1960?

Mr. CONNELL: In 1960.

Mr. DAIN: It seems to me we have got to be clear about one thing. These figures relate to costs as a percentage of our selling price, and they do not relate to the total amount of all costs.

Mr. MILLIGAN: That is fine.

Mr. HORNER (*Acadia*): I have a supplementary question, following Mr. Milligan. Would this shutdown be because of the model changes that are referred to there?

Mr. CONNELL: That is correct.

Mr. HORNER (*Acadia*): I know a little bit about John Deere equipment, and you did make a drastic model change in 1960, did you not?

Mr. CONNELL: That is correct.

Mr. HORNER (*Acadia*): Far more than would constitute just a general model change that you would make over the years?

Mr. CONNELL: A complete re-tooling on this job.

Mr. HORNER (*Acadia*): Which is why there is such a sharp change. The reason I want to make this clear is that we have had evidence before us that model changes add considerably to the costs, but this was an unusually large model change that John Deere had in 1960, am I not right?

Mr. CONNELL: I would say that it is a completely new tractor, compared with anything that we have produced before.

Mr. HORNER (*Acadia*): What I want to make clear is that such changes that John Deere has brought about over the years have been really minor, compared to this.

Mr. CONNELL: That is correct.

Mr. SOUTHAM: Now a supplementary question to that, Mr. Chairman: Following this drastic change we are referring to, what will be the outcome? Will it give us a better machine and greater productivity, and give the farmers a greatly increased production, or is it more changes in your own machine manufacturing industry in comparison with other machine manufacturing companies?

Mr. CONNELL: No, it was developed in order to give the farmer a better machine, one which had more horsepower and which was functionally better and could do more jobs and do more for the farmer.

Mr. SOUTHAM: And could ultimately result in lower costs for the farmer?

Mr. CONNELL: That is correct.

Mr. KORCHINSKI: Since we are on that subject and my question related to that, in looking at this first page the percentage of plant depreciation for 1955 was 2.6, and in 1960 it was 6.1. Was it because of the vast changes in the molding, et cetera, or was it other changes in your plant that contributed to this greater increase, of almost two and one-half times, in plant depreciation?

Mr. DAIN: The answer to this has to be broken into parts. Part of it is because of the increase in the cost of the tooling itself. In the new tractor line we think that eventually the capital cost of that line will be higher than previously, and conversely, we hope that the direct labour costs will be that much lower. However, in this year, this 6.1 per cent is really affected by lower volume in 1960, so we do not expect this percentage figure to be representative of future years.

Mr. KORCHINSKI: How do you reflect plant depreciation in volume?

Mr. DAIN: We did not sell as many tractors in 1960. The depreciation cost is a fixed cost, and each tractor costs more per unit in terms of depreciation.

Mr. KORCHINSKI: On page 6 of this report you state the profit of all United States manufacturers declined from 10.2 cents per dollar to 6.5. My question is: How much of this was real assets, or was there a reassessment in your plant value? In other words, let us say a machine plant is worth \$1,000 in 1950, and by reassessing your valuation in 1961, it can be worth \$1,500. How much of this was in real value added to the plant, or how much added by means of reassessing?

Mr. DAIN: United States accounting practice requires that all capital assets be valued at their cost, less depreciation. There is no write-up.

Mr. KORCHINSKI: In other words, there is no current increase in that?

Mr. DAIN: No.

Mr. THOMAS: I have several general questions, Mr. Chairman. The first has to do with whether these gentlemen have the figures on the balance of trade between Canada and the United States as far as their operation is concerned. Do you have figures indicating how much of your John Deere machinery produced

in Canada is exported, and how much of your machinery, dollar-wise, sold in Canada is imported?

Mr. CONNELL: Yes, I think we covered that in the brief, and also in some remarks that I made.

Let us first take our Welland plant. I covered that in an aside. Our Welland plant ships approximately 65 per cent of its product into the United States, 30 per cent to Canada, and if we were to take that and turn that around, for Welland into Canada it would be somewhere in the neighbourhood of \$3 million that goes into Canada from our Welland plant.

Mr. THOMAS: That goes into Canada?

Mr. CONNELL: Goes into Canada, and the other 5 per cent goes overseas.

Mr. THOMAS: Could you put that in dollars? \$3 million goes into Canada.

Mr. CONNELL: Very well. I will have the figures for you in just a second. About \$5.8 million would go into the United States, and about \$2.6 million or \$2.7 million would go into Canada, and about \$500,000 go for export overseas.

Mr. THOMAS: Is the Welland plant the only one where you manufacture in Canada?

Mr. CONNELL: Yes, that is the only plant.

Mr. THOMAS: What would be the volume, dollar-wise, of the equipment which you import into Canada for sale?

Mr. CONNELL: I think we covered that in the brief. It would be \$39 million less \$2.7 million that I gave you. Let us say, roughly, that it is \$36½ million.

Mr. L. KELLOGG (*Economist, Deere & Company*): You are thinking of goods coming in from the United States?

Mr. CONNELL: Yes, goods imported; there is nothing which comes in from overseas.

Mr. THOMAS: If the North American machinery market is considered as a whole, where would be the most convenient and economical geographic location from which to supply the market?

Mr. CONNELL: That is a good question. I can only answer it by giving you an opinion. It seems to me that the midwest, where most of our plants are presently located, is just about in the centre of the area from which it is easy to get to any point in the United States, and to a good many points in Canada.

Mr. THOMAS: The brief indicates that an increase in volume of production would tend to decrease the price of the product. Would a decrease in wage rates in Canada tend to increase the scope of your John Deere operations in Canada, that is, manufacturing?

Mr. CONNELL: If you mean whether our costs of building machinery would be reduced, by reason of labour costs reducing, I would say that if this influence were brought about, there would be a good possibility that there could be a reduction in price, provided that other costs did not offset them.

Mr. THOMAS: Then, conversely, would an increase in Canada, including an increase in labour or wage rates, tend to decrease the scope of your manufacturing operations in Canada?

Mr. CONNELL: I think it might well do so, because, undoubtedly, it would necessitate a price increase, and if the prices became higher, I think we perhaps might lose some volume by reason of that.

Mr. THOMAS: Your profits in 1960 are stated to have been between six and seven per cent.

Mr. CONNELL: I did not get the first part of your question.

Mr. THOMAS: Your profits in 1960 are stated to have been between six and seven per cent. Is that correct?

Mr. DAIN: Upon assets, relative to assets.

Mr. THOMAS: Yes, it states here, where you speak of profits—I did not look at the page; yes, it is on page six.

Mr. DAIN: That is our 1957 to 1960 average.

Mr. THOMAS: Yes, it averages 6.1 cents. Would that be computed before or after corporation taxes are paid?

Mr. DAIN: After taxes.

Mr. THOMAS: You say after taxes?

Mr. DAIN: Yes.

Mr. THOMAS: And that would be available for distribution to the shareholders.

Mr. HORNER (*Acadia*): Mr. Chairman, I have a supplementary question on profits. In your sheet number three of the supplementary data you have a graph with regard to selling prices, hourly wages, and materials prices. I wonder what your profit would look like on a similar graph. Would it be going up from 1950 to 1960? You said 1959 was the best year since 1950. Would this run parallel?

Mr. DAIN: It would look something like a limp clothesline.

Mr. HORNER (*Acadia*): In other words, they were high in 1950 and they fell during the middle period, and came up again in 1959?

Mr. DAIN: Yes, that is right. It took a much greater volume of business at the end of that period to produce the same total profit that they had at the beginning of the period.

Mr. HORNER (*Acadia*): I have a further supplementary question. On chart number two of the same pamphlet, you distributed, you have a list of your sales in constant 1950 dollars.

Mr. DAIN: Yes.

Mr. HORNER (*Acadia*): I am led to believe from this that your volume of sales at constant 1950 dollars, has remained relatively stable in that whole period of 1954 to 1956, and that it reached a higher peak in 1959. Am I right in that?

Mr. DAIN: Yes, that is right.

Mr. HORNER (*Acadia*): This would be your volume of production, relatively?

Mr. DAIN: That is true.

Mr. THOMAS: I wonder if the witness could give us the amount of capital invested per employee.

Mr. DAIN: We could compute it.

Mr. CONNELL: I could give it to you within just a few dollars.

Mr. THOMAS: That sounds pretty good.

Mr. CONNELL: This will be as of October 31, 1960, which are the last figures I have. It was approximately \$27,000 per employee.

Mr. THOMAS: Where are the foreign plants that are mentioned on page two, and which produced about 10 per cent of the total of the John Deere products? Where are they located?

Mr. CONNELL: We have a plant in Mannheim, Germany, and also in Zweibrucken, Germany. We have one in Monterey, Mexico, and we have an assembly plant in Rosario, Argentina. These are our foreign operations aside from Welland.

Mr. THOMAS: And the second one you said was where?

Mr. CONNELL: It is in Zweibrucken, Germany.

Mr. THOMAS: You say in Germany?

Mr. CONNELL: That is correct.

Mr. THOMAS: You have two in Germany?

Mr. CONNELL: That is correct.

Mr. MILLIGAN: Do you manufacture all machines in Welland, or just some particular line?

Mr. CONNELL: No. We—perhaps Mr. Dain has a list.

Mr. THOMAS: Would your company manufacture a full line? You have a plant in Mexico, and you have an assembly plant at Rosario, Argentina.

Mr. CONNELL: Well, Rosario is more than an assembly plant. No, we do not manufacture a full line of goods in Mexico.

Mr. THOMAS: But you do some manufacturing?

Mr. CONNELL: That is correct.

Mr. MILLIGAN: Might I have a list of the machines you manufacture at Welland?

Mr. DAIN: I will give it to you. For the year 1950 Welland made tillers, seeding attachments, grain and corn binders, field cultivators, and grain drills.

This year, in 1961, it includes tillers, and seeder boxes, harrows, wagons, windrowers, power hoes, snow plows, "gyramors"—this is a rotary cutter—log arches, bulldozers, and loaders.

Mr. CONNELL: There is one other item which we have not mentioned. That is side-booms. That is an industrial product.

Mr. DOUCETT: I would like to ask the witnesses about the dominion bureau of statistics wholesale price index for iron and its products, which takes the basis of 1935 to 1939, as 100 per cent. In the last ten years, 1949 to 1960, it increased 45.8 per cent. Labour over a similar period increased 99.3 per cent, and taxes 268.5 per cent. Those are figures which we were given the other day. I was wondering how they would compare with your experience over a similar period of time in Canada, of course?

Mr. KELLOGG: You are using a basic period of 1935 to 1939.

Mr. DOUCETT: That is right, as a basis of the 100 per cent, and the increase was from 1949 to 1960.

Mr. KELLOGG: I do not have precisely that same comparison, but on the data sheet which we gave you as number eight, we have 1950, which is almost the same.

Mr. DOUCETT: Yes, that is close enough.

Mr. KELLOGG: Number eight—this is for the United States; this is what you asked for? You asked for a comparison with the United States?

Mr. DOUCETT: No, I was asking for a comparison with Canada, but you may give it. I asked how your figures compared in Canada with these figures?

Mr. KELLOGG: We do not have that.

Mr. DOUCETT: Could you give them for the United States?

Mr. KELLOGG: You mean our increase in the United States. I do not have it either. We have an index which is based on our own prices that we pay for a great variety of goods. On sheet three we have given our total prices, but we have not given a breakdown of them.

Mr. DOUCETT: You would not know what the percentage of increase was on iron and its products?

Mr. KELLOGG: No, but we could get it. We do not have it here.

Mr. DOUCETT: Or for wages either, or taxes? Could you give us the three of them?

Mr. KELLOGG: This is for Deere & Company increases?

Mr. DOUCETT: Yes, for iron and its products.

Mr. KELLOGG: Iron and steel and taxes.

Mr. DOUCETT: Yes, and wages of employees and taxes.

Mr. KELLOGG: We have given our increase in wages in sheet number three.

Mr. DOUCETT: For what period?

Mr. KELLOGG: On sheet three the data are with respect to wages paid per hour, 1950-60, including all our fringe benefits: these are the increases we have paid, and it shows an increase there of 81 per cent.

Mr. DOUCETT: For what?

Mr. KELLOGG: For wages.

Mr. DOUCETT: Over a period of ten years?

Mr. KELLOGG: That is right, 1950 to 1960.

Mr. DOUCETT: That is a 19 per cent difference. What would the average rate be per hour?

Mr. KELLOGG: It is about \$2.50; the total is about \$3.50, and the \$1, difference, is accounted for by fringe payments.

Mr. DOUCETT: You say \$3.50?

Mr. KELLOGG: Approximately.

Mr. DOUCETT: With \$1 for fringe benefits?

Mr. KELLOGG: Yes. These are rough, just approximate figures.

The CHAIRMAN: We shall adjourn now to meet again at 2:30 in this same room.

AFTERNOON SITTING

MONDAY, May 22, 1961

The CHAIRMAN: Gentlemen, at adjournment time I believe Mr. Doucett was asking some questions of our witnesses. Were you finished, Mr. Doucett?

Mr. DOUCETT: Yes, for the present. I do not want to monopolize the time of the committee.

The CHAIRMAN: Mr. Korchinski?

Mr. KORCHINSKI: On page 2 of your brief you indicated in 1960 the number of tractors produced in your industry, and stated that it was only about 8 per cent of the number of Chevrolets and Corvairs, et cetera. Do you not think this is a fair percentage of the market, considering that, in the United States, I think only 8 per cent of the people are involved in agriculture, and in Canada only 11 per cent are involved in agriculture, so that if you have 8 per cent that is about all you can hope to get. The automobile industry, for instance, has the whole country as their customers. Do you not think it is a fair comparison?

Mr. KELLOGG: I think the point we are trying to make is that, compared with these mass production industries, farm machinery is not mass production. It was not whether the percentage was too big or too little, but that here we have, of all farm machinery, of all tractors, only 8 per cent of these two mass production automobile companies in terms of their production, and this 8 per cent is comprised of eight companies against either Ford or Chevrolet. So that 160,000 tractors produced, for instance, last year in eight companies, we wanted to point out is not really mass production in the usual sense.

Mr. KORCHINSKI: I understand what it is all about, now. My next question is in relation to some of the statistics given to us this morning. I noticed in 1950 you had a working staff of 25,000, in 1960 you go up to 27,000, and in 1955 you had 21,000. I wonder if it is fair to assume, then, that you have been increasing your line of production, or what has accounted in the increase of the staff, for example, from 1950 to 1960? There may have been ups and downs; but as I notice, because I can see in 1955 there were 21,000—is this a result of automation, that there was a drop, and then perhaps an increase in an expanded market? What has accounted for this? I think if we had the whole ten years before us, we might be able to understand more fully.

Mr. DAIN: In 1954 and 1955, which is the middle of that ten-year period, there was a low point in both sales and production which, of course, influenced the total employment. In 1950 there was relatively high production, and in 1960 it was relatively high. In 1954 and 1955 production was much lower, relatively, than those two end years.

Mr. KORCHINSKI: So that automation has not really resulted in too many people being laid off, or fewer employees?

Mr. DAIN: It is really difficult to say, because you would have to be able to measure how many people you would have had in 1960 if we had not made increases in automation, as you call it, or invested more money in machine tools, et cetera, during the ten-year period. We really have no way of knowing.

Mr. KORCHINSKI: But can you give us any idea as to how your line of production has expanded, how many more machines, or something of that nature? Can you give us some idea as to how the plant has expanded in its operations?

Mr. CONNELL: I am afraid I cannot answer that directly. In the ten years we have, I know, introduced many new machines; but frankly I cannot tell you how many. I just do not know.

Mr. MILLIGAN: Has automation reduced the number of employees, or has it more or less stepped up your production with the same number of employees?

Mr. DAIN: There, again, sir, you would have to know how many people we would have today if we had not made the increased investment in tooling, and I find it difficult to estimate. But I think it is safe to say that we would have more factory production workers now, for our present volume, if we had not made investments in capital during this ten-year period.

Mr. MONTGOMERY: Could I follow that up with another question on the same point? To what extent could the farm machinery production in your Canadian plant be mechanized or subjected to automation?

Mr. DAIN: This is tied in with the first question about mass production. There is a very definite limit to the amount that you can invest in capital when your production runs on any particular machine are low. Where that limit is depends upon the market for each particular machine, and is hard to generalize about. For that reason, we cannot go as far as the automobile companies, for instance, in substituting machine tools for labour, because the production runs are too small to make the investment in that additional tooling pay off.

The CHAIRMAN: Did you have a supplementary question, Mr. Doucett, along the same lines?

Mr. DOUCETT: Yes. When we adjourned this morning, I was asking a question about the increase in cost of materials, labour, taxes, et cetera, and the last question answered, I think, was the average labour cost as \$3.50 an hour, \$1 of which I understood went for the fringe benefits. I was wondering if it was possible to tell us if the fringe benefit costs have gone up proportionately with the labour costs; also, what do the fringe benefits cover?

Mr. KELLOGG: Let me divide this question: First, the straight time, or regular straight-time hourly earnings: In 1950—if we could take two points

again—in 1950 the rate was \$1.53 and in 1960 it was \$2.54. Now, that is straight-time hourly earnings. That is an increase of \$1.01. Now, when the straight-time rate was \$1.53, the total employment cost which took account of the fringes—and I will describe those in a minute—was \$1.95. It has now risen so that in 1960 it averaged \$3.53. The difference between \$1.53 and \$1.95 was 42 cents, and the difference now is \$1. So, the total of the fringe benefits has gone up more than 100 per cent.

The difference between the straight-time hourly earnings and the total employment costs per hour, per worker, is due to a number of factors. It includes all of the compensation paid to workers, plus the benefits for pensions, social security taxes, accident compensation, group life insurance, supplementary unemployment benefits, health and accident, plus holidays, vacation pay, bonuses, and plus overtime and penalty pay. It includes all those things.

Mr. DOUCETT: Those are all in the United States; but you would not be paying all those benefits in Canada, would you, in your factory here?

Mr. KELLOGG: We pay all of them. When I say all of them, I am not sure about each one; but we pay most of them here at slightly different rates. We do not have figures for Welland on this basis, but I think if we were to compare them with our Canadian rates, they would show that the Canadian rates were considerably behind this at the start, but that they have, during the ten-year period, tended to catch up. In other words, they have even risen at a faster rate—which they are bound to do, because as our rates in the United States go up, it is clear that Canadian rates will also move up at approximately the same rate, I would think, or, as in this case, a little faster.

Mr. THOMAS: A supplementary question, please. Can you give us the current comparative figures? These, I take it, are in the United States?

Mr. DAIN: Yes.

Mr. KELLOGG: Yes, these are the total factory figures, and this includes Welland.

Mr. THOMAS: This is the over-all?

Mr. KELLOGG: Yes.

Mr. THOMAS: You have not got Welland separate?

Mr. KELLOGG: No, I have not.

Mr. THOMAS: What I want is a comparison between the American rate and the Canadian rate.

Mr. MILLIGAN: I think one of the companies suggested their average rate was \$2.19. Would that compare with your rate in your Welland company?

Mr. DAIN: I have some figures I can give you about the comparisons on an annual basis, if that would help, or I can give you the percentages between the United States and Canada, which I think you want—not specifically Welland, but the entire Canadian operation. In the early part of the period, let us say 1950 and 1951, Canadian salaries were about 66 to 67 per cent of the United States salaries. The hourly costs on an annual basis in Canada were about 72 per cent of the United States rates. In the last couple of years the Canadian salary per employee is about 85 per cent of the United States.

Mr. DOUCETT: How do you differentiate between the hourly pay and the salary? You give one as salary, and the other as hourly pay. Is that the difference between the salaried men and the office men?

Mr. DAIN: It would include everybody who is paid on a salary basis, such as clerks, and so on. The comparable figure for the hourly people would be approximately 90 per cent, from 87 per cent to 90 per cent of the United States figure. This is without fringes, however. I do not have the figures with the fringes added in.

Mr. FORBES: When was your plant established at Welland?

Mr. DAIN: Deere & Company bought that plant when the present corporation was put together in 1911. My grandfather started the plant in 1906 or 1907.

Mr. FORBES: What equipment do you make there? Do you make tractors there?

Mr. DAIN: No sir. The tractors are all made in the United States.

Mr. FORBES: Do you make combines there?

Mr. DAIN: Combines are all made in the United States.

Mr. FORBES: Do you make balers there?

Mr. DAIN: At Welland we make tillers, harrows, wagons, windrowers, power hoes, snow plows, "gyramors", log arches, and so on.

Mr. FORBES: Do you make bulldozers?

Mr. DAIN: Yes.

Mr. FORBES: Those bulldozers would be for heavy industrial equipment use?

Mr. DAIN: Yes, and we sell some for agricultural purposes.

Mr. KORCHINSKI: How does the cost of materials in your Welland plant compare with the cost of your United States operations, for example, in the case of steel?

Mr. DAIN: I could not answer specifically; I would assume it would be approximately the same. There would not be too much difference.

Mr. KORCHINSKI: I notice in your percentage of cost, under selling price for example, that with the exception of the tractors, the combines, the balers, and so on the percentage of cost of materials is lower. Is that attributable to the fact that there is less material used in each one of these machines, or is it relative, and that the cost of the material you use is not rising as fast, for example, as your salaries and so on, or other expenses?

Mr. DAIN: That is very difficult to say unless you took a particular machine and analysed it more deeply than I am able to do it. It could only be accounted for by changes in quantities and materials, or types of material, because the prices of materials have gone up.

Mr. KORCHINSKI: If you wished to use any one of these, for example, such as a combine—use that one, for example?

Mr. DAIN: This percentage does not mean that the total cost of the materials did not rise in the period 1954 to 1960.

Mr. KORCHINSKI: I understand; but the fact that as a percentage of total cost it has not risen as rapidly as some of the other factors which go into the final cost. I would like to know if there is less material? Is that an assumption in the cost?

Mr. DAIN: It would, if we had different types of material that are of lower cost than in the earlier period.

Mr. KORCHINSKI: Let us take the tractor, for example. That has risen in the one year, 1960. Is it because you have gone into a new line of manufacturing, and this has contributed to a different type of material which may be costly?

Mr. DAIN: The tractor figure is distorted by last year's shut-down. But the comparable 1959 figure is not very different.

The CHAIRMAN: Are there any further questions?

Mr. GUNDLOCK: On this item of plant depreciation, I notice it apparently drops. Take the tractor, for instance, which goes from 2.4 down to 1.8 and

up to 6.1; and over here on the combine, I realize the reason is that it is a different plant.

Mr. DAIN: All the depreciation of the fixed assets on the plant and buildings, the machine tools, the dies, the jigs, and so on—they would vary from one type of machinery to another.

Mr. GUNDLOCK: This morning I think you said in answer to a question on the first page in relation to tractors, that it was the cost of depreciation and later on you said you were required to separate your costs and depreciation, that is, according to the audit procedures in the United States. I am still a little mixed up on this. Are they costs and depreciation, or is it simply depreciation? If not, why did you not separate them? I do not understand that.

Mr. DAIN: I do not quite understand your question. This figure here is only depreciation, a portion of the cost, the cost of depreciation charged to this type of machine during the year shown. That is all that is in there.

Mr. GUNDLOCK: What is the difference between 1950 and 1960 then?

Mr. DAIN: In the tractor?

Mr. GUNDLOCK: No, in the same plant, the same tractor, 1.8 in 1959 and 6.1 in 1960. You explained that you were shut down and re-tooling and one thing and another. But why would the depreciation on just the plant jump like that?

Mr. DAIN: For two reasons: first, because we had a large investment in the tractor facilities, and the capital required to produce tractors; and secondly, we did not sell as many tractors in 1960, so each tractor we sold bore a higher percentage of cost.

Mr. MONTGOMERY: This figure is based on sales value, I understand.

Mr. DAIN: Yes, it is influenced by the sales volume; and any drop in sales volume would affect the pattern here, and it would go up in terms of percentage.

Mr. SOUTHAM: Following up the question of salaries and wages, my thought arises from the evidence we have had here in the committee, and in a brief which is to be presented by labour. In reading it over, it appears that they minimize or play down the labour factors of cost. Yet in looking over the table, it would appear in my estimation that they thought the increase in labour is definitely up, and that it would enter into the cost of machinery. Would you go on record as substantiating that point of view?

Mr. DAIN: If you look at the plant labour-weekly line for 1960, you will see that the weekly plant labour is approximately 15 percent of the cost of the tractor. When you add to it the total labour figures and include the salaried people, the total employment costs of all the people involved in our company in producing the tractor is approximately 26½ per cent. So it is a significant part of the cost of the tractor. I might point out too, that in this materials figure, there is a large amount of labour which is used by our suppliers. We are paying here for the labour of all our suppliers of basic raw materials; so the total proportion of labour cost in the tractors is very much higher than the 26½ per cent that I mentioned.

Mr. SOUTHAM: Some of the previous witnesses have broken these cost components down into about four basic items, such as materials, labour, salaries, plant maintenance and production costs, and have stressed transportation. In your total here, you do not specifically mention transportation. Under what group of figures does that appear? I am thinking of the movement of raw materials in connection with production. Would a particular group of figures cover that?

Mr. DAIN: Some of them would be in the plant labour weekly. That is wages paid to people within the plant who handle material in the plant from the receiving department to the shipping dock. The costs of shipping are included

under S.S. and G., and is a part of the salaries and wages figure. The cost of transporting material that we purchase—I am not just sure where that is, frankly. It is either in the materials or in this “Other” item of plant expenditures.

Mr. CONNELL: It is in the materials.

Mr. KORCHINSKI: What does S.S. and G. stand for?

Mr. CONNELL: Shipping, selling, and general expenses.

Mr. MILLIGAN: Would your freight traffic be charged to salaries?

Mr. CONNELL: That is for in plant stuff. The transportation costs of out-bound products are paid by the dealer.

Mr. MILLIGAN: That 26 per cent that you suggest for labour cost would include your transportation as well?

Mr. CONNELL: No, only the movement of materials inside the plant, because the cost of getting materials from suppliers to the plant is included in the materials.

Mr. SOUTHAM: I have another question, but I shall leave it until we come to the subject of credit and financing.

Mr. KNOWLES: I have another question that is related to the Argentina plant. Is it just an assembly plants?

Mr. CONNELL: That is correct, it is an assembly plant.

Mr. KNOWLES: I understood a while back, I either read it or someone told me,—that you could sell a lot more manufactured goods, or machinery and so on, if we were about 25 per cent lower in our costs, or in what we had to charge for it. I note that you say mass production is not too great a factor in machinery; but if you could increase your sales by one-quarter, that would be reflected very much in the price of the machinery, would it not?

Mr. CONNELL: You are referring specifically now to Argentina.

Mr. KNOWLES: Well, I am referring to our export markets in general; let us say, simply to South America.

Mr. CONNELL: If you are talking about Argentina, with which I have some familiarity, the tariff there is very high to bring anything in; so there are very few machines which can be imported into Argentina. They make their own plows, their own disc harrows, their own grain drills in Argentina, in small manufacturing plants. There are very few machines now brought in.

Mr. FORBES: On page four you say that these inventories are shipped to your dealers under a consignment arrangement under which the dealers need not pay for the machines until they are sold to the farmer. Does this policy apply to repairs and parts as well as to new machines?

Mr. TRIMBLE: No, it applies only to new machines. The repair parts must be purchased by the dealers.

Mr. FORBES: After that you say that it should be clearly understood that the prices we will refer to are wholesale prices. They are the prices which retail dealers pay us, not the prices they charge farmers. Is it your opinion that the dealer has too much of a markup between your wholesale price and his retail price?

Mr. TRIMBLE: I think in the dealer's brief the other day they attempted to prove that in their mark-up there was not too much left out of that mark-up. I do not think there are very many dealers getting rich. However, the good businessmen are improving right along.

Mr. FORBES: Referring to this new tractor you have brought out, do you manufacture all of it, including the motor, yourselves, or do you buy that motor?

Mr. CONNELL: No, we manufacture the motor, but I cannot say that we manufacture all the tractor, because like any other tractor manufacturer, we must buy certain components.

Mr. FORBES: You compare this tractor with model B. Is that right?

Mr. CONNELL: Yes.

Mr. FORBES: You compare this new tractor that you have brought out with the model B that you formerly sold?

Mr. CONNELL: Yes.

Mr. FORBES: And the price of the new one is \$2,122?

Mr. CONNELL: Yes.

Mr. FORBES: If you go back to 1958, your model B was number 520 or 620?

Mr. CONNELL: The 1958 model would be the 520 tractor.

Mr. FORBES: The price quoted here is \$3,739 less the price you charge to the dealer, according to the dealer's price book. Is that right?

Mr. CONNELL: I cannot tell you, because I do not have that price book.

Mr. FORBES: It is 1958, the number 520 in 1958, which you sold for \$2,083. I was trying to determine if your tractors were getting cheaper.

Mr. CONNELL: No, I do not think I can make that statement. What we have done here in our booklet is to take the tractor back to 1935 when we began with the model B and trace the development of that tractor up to the present day when we have the 2010. We went from the B through the 50, the 520, the 530, up to the 2010. Those tractors all were comparatively equipped. They are not a field service tractor. The 1935 tractor could do only certain jobs. If you were to buy the 2010 today equipped as was the model B in 1935 the price would be \$2,122 in today's dollars—these are wholesale and not retail prices. If on the other hand as we mentioned this morning you were to take this same model B which was built in 1935 and convert that to today's dollars, then the price of that tractor at wholesale would be \$1,644. In other words, today's price would be just twenty-nine per cent higher on a real dollar basis for a comparable tractor.

Mr. FORBES: So that the prices you are quoting in this catalogue are the prices of the skeleton.

Mr. CONNELL: Yes. That is on the old 1935 model B of which we were speaking a moment ago, with power takeoff.

Mr. FORBES: As you understand, the purpose of this committee is to determine why machinery is so high priced and has increased so rapidly over the last eight or ten years. If you could break this down and show us what the costs of the components are and the cost at retail price, then maybe we could determine whether your price or the dealers' mark-up is too great.

Mr. CONNELL: You have asked if the dealers' mark-up is too great. I think Mr. Trimble mentioned the fact that the mark-up is not.

Mr. KELLOGG: This does not quite answer the question, but in the summary on page 1, which I am sure you have seen, it indicates that the maximum drawbar power has increased 215 per cent while we have only had a twenty-nine per cent increase in the price, and a fifty-nine per cent decrease in cost per horsepower. There is a question of just what it is the farmer is buying. In terms of comparable dollars per horsepower the price has gone down a great deal. If a farmer wants to buy more horsepower concentrated in a single tractor, then the total of those horsepower gradually overtakes these increases. That is what has been accomplished in the 2010. It does represent a decrease in cost per horsepower of nearly sixty per cent, which is really quite a saving.

Mr. KORCHINSKI: What is the lowest horsepower rating tractor you manufacture?

Mr. CONNELL: Thirty-five horsepower; that would be our model 1010.

Mr. KORCHINSKI: Let us put it the other way. Back in 1935 did you manufacture a tractor with a thirty-five horsepower rating which was comparable to your 1960 1010?

Mr. CONNELL: I am not quite sure.

Mr. KORCHINSKI: I am wondering whether you could give us a comparison of the cost of a tractor in those days to your present 2010? I am trying to establish a horsepower rating—a comparison of the horsepower rating of a tractor between 1935 and 1961—and relate the prices between those two?

Mr. CONNELL: I do not have that information with me.

Mr. KELLOGG: At the bottom of page 12 we are comparing the model 2010 and the model B, but we also compare it with the model G which ten years ago was comparable in power and for the 2010. We have an increase of only \$100. That is not quite the same as your question, but is approximate.

Mr. SOUTHAM: Up to date we have had some interesting discussion on the providing of credit in respect of farm machinery. On page 4 of the brief we find this statement:

Many farmers buy their machinery on credit. Adequate financing for this purpose has not always been readily available in sufficient amount to farmers. As a consequence we have had to fill this need and this has required large amounts of capital. We have been extending credit to farmers for forty-two years.

In the course of the discussion this morning you said the cost of this financing for a twelve month period was approximately 9.95 per cent.

Mr. CONNELL: Simple interest.

Mr. SOUTHAM: That is a little less than one of the former witnesses testified. The thought comes to my mind that you people have been forced into the finance field. I suppose you have a subsidiary company?

Mr. CONNELL: Not in Canada.

Mr. SOUTHAM: But you do provide this financing here to Canadian farmers?

Mr. CONNELL: Yes.

Mr. SOUTHAM: Through your American subsidiary?

Mr. CONNELL: No; through the Canadian company. We do not have a separate finance subsidiary in Canada.

Mr. SOUTHAM: This 9.95 per cent would include not only the cost of financing, but I suppose also a little bit of a profit?

Mr. TRIMBLE: Yes sir.

Mr. SOUTHAM: On the basis of this I suppose if we could increase the amount of farm credit considerably it would relieve your company from having to provide so much financing and indirectly this should result in the lowering of the cost of the machinery to the farmer. Is that right?

Mr. TRIMBLE: Certainly through the F.I.L.A. if he borrows money at five per cent simple interest it would reduce his overall cost from what it would be if he borrowed at 9.95 per cent.

Mr. SOUTHAM: It seems to be an area in which the government of Canada might work in the not too distant future?

Mr. TRIMBLE: I think so; yes.

Mr. GUNDLOCK: A while ago I think it was stated that you had no out-shipping cost because the dealers paid the freight. Then later on you said the machinery was supplied to the dealer on a consignment basis. Does that mean

the dealer pays the freight on the consignment and that if he did not sell it he would send it back to you?

Mr. TRIMBLE: We actually pay the freight right to the dealer's door. The dealer pays the freight when he sells the machine. He collects the freight along with the price of the machine.

Mr. GUNDLOCK: If he does not sell it, what happens?

Mr. TRIMBLE: You mean if he does not eventually sell it?

Mr. GUNDLOCK: What happens if he does not sell it? Does the same thing apply in the case of repairs?

Mr. TRIMBLE: No. They are purchased f.o.b. branchhouse by the dealer.

Mr. GUNDLOCK: Are there any refunds?

Mr. TRIMBLE: We have a return policy which allows them to return a certain percentage of their purchases each year.

Mr. GUNDLOCK: Would you state that percentage?

Mr. TRIMBLE: Five per cent of his previous year's purchases.

Mr. GUNDLOCK: At full value?

Mr. TRIMBLE: No sir; there is a fourteen per cent discount on those parts—four per cent to cover the discount we figure he got and ten per cent to cover handling.

Mr. GUNDLOCK: To get back to my original question, what happens if that dealer does not sell the consignment; what happens to him?

Mr. TRIMBLE: If the machine does not sell in that particular district to which it was shipped it will be transferred to some other district where it will be sold.

Mr. GUNDLOCK: At your cost?

Mr. TRIMBLE: Yes.

Mr. KORCHINSKI: After a period of time does he have to pay interest charges on that type of machine if it is not sold?

Mr. TRIMBLE: No.

Mr. FORBES: How long can he keep the parts?

Mr. TRIMBLE: So long as the parts are on the returnable list.

Mr. FORBES: How long is that?

Mr. TRIMBLE: So long as the part is on a fast moving list.

Mr. FORBES: It could be within six months or one year?

Mr. TRIMBLE: No.

Mr. FORBES: Could it be within two years?

Mr. TRIMBLE: It could be. If we bring out a new machine, and bring out a list of parts, if he puts those into his stock and a sale pattern does not develop within two or three years, we will take them off the returnable list and he will have forty-five days to return those parts.

Mr. FORBES: Would you tell us the wholesale price of this new 2010 tractor at, say, Winnipeg, Manitoba?

Mr. CONNELL: Based on this \$2122 we show in the book?

Mr. FORBES: Yes.

Mr. CONNELL: It would be \$1697.60—I am sorry; \$2122 is the wholesale price. The freight would be added to that.

Mr. FORBES: To Winnipeg?

Mr. CONNELL: Yes.

Mr. KORCHINSKI: My question has to do with dealerships. Have you had

a reduction in the number of dealers in the last ten years, particularly in western Canada.

Mr. TRIMBLE: Yes; we have.

Mr. KORCHINSKI: Would you indicate how many dealers less?

Mr. TRIMBLE: I have the figures here. In 1951 we had 732. In 1954 that had increased to 819. From then on it has been reducing. In 1960 there were 608 for all of Canada.

Mr. KORCHINSKI: What about the western provinces? Do you have it broken down?

Mr. TRIMBLE: I have it broken down by provinces: Alberta had 219 in 1951; 166 in 1960; Hamilton 1953, 186; 1960, 177—In 1951, 217 in Regina, which is Saskatchewan, 1960, 143. In Manitoba in 1951, 177, and in 1960, 122.

Mr. KORCHINSKI: Has the loss or the reduction in the number of dealers accounted for your policy of withdrawing some of your distributing offices? You used to have a distributing office at Yorkton and now the nearest one is at Winnipeg. Has the reduction in the number of dealers accounted for this change in policy.

Mr. TRIMBLE: Yorkton is still a distributing point.

Mr. KORCHINSKI: I think there has been a change in policy in the last ten years.

Mr. TRIMBLE: We have taken out of there the office end, but we still maintain a stock of machines at Yorkton.

Mr. KORCHINSKI: But is it not a limited stock?

Mr. TRIMBLE: It is limited to the extent that we do not keep all of the options there. The basic machines that are sold in that district we do keep there.

Mr. KORCHINSKI: How has that affected the price? Has this reduction tended to reduce your cost, or has it tended in any way to reduce the cost to the dealer and therefore is passed on to the farmer?

Mr. TRIMBLE: I think the only way I could answer that would be to say, what would our costs have been if we had not taken some of these steps? At one time we had five or six separate distributing places in Saskatchewan. We kept stocks of parts and stocks of goods in every one of these, and office staffs at every one of these. We have reduced those, now, and I cannot tell you what our costs would be, if we had not done that.

Mr. KORCHINSKI: But this was primarily a move on the part of the company to reduce some of their own costs. Was this what your primary concern was?

Mr. TRIMBLE: To reduce costs.

Mr. KORCHINSKI: Your own; I am speaking of the manufacturer's costs, or your own costs.

Mr. TRIMBLE: To keep from raising prices.

Mr. KORCHINSKI: Yes, I understand that.

The CHAIRMAN: Mr. Connell made a statement a while ago, and he would like to make a correction.

Mr. CONNELL: I made a statement a short while ago; concerning our Argentine plant. I said it was strictly an assembly plant. That is not strictly so, because we do manufacture some components down there, and in our operations there we must build a certain quantity of components ourselves, and we can import others. I just do not know what those components are, but I do know we are building some components in the Argentine, and before I gave the impression that we were strictly an assembly plant.

Mr. KNOWLES: What I was wondering was what their costs would be in Argentina.

Mr. CONNELL: I am afraid I cannot answer that question.

Mr. KNOWLES: Have you any idea on that? Do you bring any of the products from the Argentine up to Canada, at all?

Mr. CONNELL: None at all.

Mr. HORNER (*Acadia*): I must apologize if I repeat some of the questions that have already been asked, but on chart No. 4—and if I am repeating, please tell me so—on chart No. 4 of the supplementary data, you have marked at the top, “others”, and I see that “others” has jumped substantially from 1949 to 1960. Can you perhaps explain what caused that?

Mr. DAIN: If I may answer, Mr. Chairman, the primary reason, Mr. Horner, is because of the unusualness of 1960. We had a large volume of non-recurring expenses last year, connected with the tractor changeover which is reflected in these other costs. It does not represent a sudden increase that will continue in the future—at least we hope not.

Mr. HORNER (*Acadia*): Looking at that same chart, if I may ask a supplementary question, I see where the amount that has been attributed to labour has gone up steadily. I have mislaid the figures you gave this morning with regard to the amount of labour employed, but I believe it was relatively the same from 1950 to 1960. Am I right in that?

Mr. DAIN: In terms of numbers of employees, yes.

Mr. HORNER (*Acadia*): In other words, automation has not really taken the place—maybe this has been covered.

Mr. DAIN: That is right again, except that 1960 is unusual. You see, from 1950 to 1959 total employment costs went up from 30 cents to 36 cents per dollar of sales, which means the prices have not gone up as rapidly. Hourly wages in the same period to 1960 went up 81 per cent. So, the increase in the cost per dollar of sales has not been as great as our own increase in cost per hour.

Mr. HORNER (*Acadia*): I notice in the same chart that material has decreased very slightly. Would this tend to point out that there are greater engineering designs in machines today, where it requires less material?

Mr. DAIN: Some substitution materials, probably.

Mr. HORNER (*Acadia*): Would you say, sir, that if you were the only producer of agricultural machinery, say, in Canada, or on the North American continent, that you would cut down on the number of models you would produce, or would you increase them? This is a general question, but maybe you could give us some idea.

Mr. MONTGOMERY: Perhaps he wishes he had a monopoly; I don't know.

Mr. TRIMBLE: I do not think you can cut down on the number of models.

Mr. HORNER (*Acadia*): You say that you should not cut them down if you are the only producer?

Mr. TRIMBLE: The only reason we bring out a modification or different attachment for a machine is to meet the requirements of the farmers. We would much prefer to make one model, and one model only. We can reduce our costs substantially, but one model will not now fit in in the east and west, and it will not even fit in, in various districts of the west alone.

Mr. MILLIGAN: When you brought out this 2010, was that more of a general purpose tractor? Was that brought out for the purpose of cutting out some of the models, and that it would be a more efficient tractor for the average work?

Mr. TRIMBLE: The 2010 is made in several models. It is not only one model. It is made in several models. It is a general size. The 3010 is another size; the 4010, another size, and the 1010 is a smaller size, but in each one there are several models, the row crop utility, standard utility, diesel, L.P. gas.

Mr. HORNER (*Acadia*): A further question, please. On page 3 you say:

This is risky business and is subject to many things over which we have no control.

Are you implying that perhaps because of the risky nature of the business, you must watch your profits and losses a lot more closely than some other businesses which might be less risky?

Mr. DAIN: About the same as the farmer's business, Mr. Horner. The farmer takes a risk every time he plants a crop. He does not know how he is going to make out until the harvest, and until he knows his selling price. About September we have to sit down and decide what our production schedules are going to be for next year's sales. We have to make those machines that far ahead. We have to try to estimate what our sales will be at that time. We cannot have the advantage of knowing what the actual number of machines is that are going to be sold, so the risk is great.

Mr. HORNER (*Acadia*): I agree with you that farm business is plenty risky; but what I mean is, generally speaking, take the grocery trade, for example: In the grocery business, since everybody eats, the mark-up is small. But you take the jewelry business, for example—well, you do not buy jewels unless you have money to spend, and therefore the mark-up is higher and the profit may be greater if you sell it. I am not saying that John Deere can be compared to the jewelry business, but I mean it is one of the riskier businesses and therefore you expect a higher profit in good years.

Mr. DAIN: It takes more dollars of investment to produce a dollar of sales in this kind of business, than it does in most kinds of business. That is one element of the risk.

Mr. HORNER (*Acadia*): I have another question, Mr. Chairman. I am sorry I was unable to attend this morning.

Mr. SOUTHAM: I would like to have a supplementary question. As far as estimating the production you are going to need next season,—and you do not know whether you are going to run into a crop failure, and conditions of sales are not as good, and some of these machines may become obsolete,—can you give us an idea how that would figure into the cost factor. In other words, you would have to give discounts, possibly, to the dealers to dispose of the units the following year. What percentage of the over-all sales would be related to that figure?

Mr. DAIN: Not necessarily that, but we would have our costs related to last year. We would have to pay interest, and that sort of thing.

Mr. SOUTHAM: And would that be in the over-all picture? Have you any idea what that would be?

Mr. TRIMBLE: There is no factor in price to cover that. It is taken out of the profit.

Mr. CONNELL: Not in setting the price.

Mr. SOUTHAM: I was wondering if you made allowances for that contingency.

Mr. HORNER (*Acadia*): My other question is on testing. I know John Deere probably have their own type of field testing, and farms on which they do a great deal of testing of machinery, such as when there is a change of model. We are led to believe that these tractors are all tested. Have you farms on which you put them through actual tests?

Mr. CONNELL: Yes, we do. Every machine is brought out in the very beginning, say, as a prototype machine,—an experimental machine—and these machines are tested in various parts of the country under as many different conditions as we can find that we believe the machines will eventually work under. Then, we go even farther than that, in that sometimes before we even set the price on a machine, we will have a preproduction run on those same machines. We even put them in the hands of some farmers to see if there are any things wrong with the machines. If they pass those tests—and they are carried out under, as I say, all the conditions that we can conceive of the machine getting into—then we get into production on the machine.

Mr. HORNER (*Acadia*): The reason I asked that question, sir—and I wanted to know just how far you went into testing—we had before us, at the last meeting, a brief submitted by the Saskatchewan government in which they said they had set up testing stations out there, and I asked them regarding the dual windrow swather, on which they had distributed a pamphlet. With regard to this swather, the answer was that the company had sold a number of them in Saskatchewan, and just about the time the Saskatchewan A.M.A. testing branch had tested the swather, the company decided to take it off the market. This appeared to me to be doing the testing after the machine was on the market. In this particular instance I am happy to say the farmers were refunded their money, but the point I wanted to make was, are these machines fully tested before they are put out to sell to the farmer?

Mr. CONNELL: Yes, sir, to the very best of our ability, they are tested.

Mr. HORNER (*Acadia*): Well, do you see, or do you contact the A.M.A. Saskatchewan government testing branch out there, to any great extent?

Mr. CONNELL: I would like to say this, in respect of that; we have co-operated with the Saskatchewan group, and I think they have tested four of our machines. However, these tests have been long after we have made the tests ourselves. I cannot tell you how effective they have been, but we have cooperated, and as long as they are testing out there, we would propose to continue cooperating.

Mr. HORNER (*Acadia*): I do not want to labour this point, but I noticed, a particular baler was tested by them and it put out about 31,000 bales. Now, to me—and I have some knowledge of balers—this would perhaps be—and in fact they even said this was half the expected life of the baler—this appears to be quite an extensive testing program they are carrying on out there. Have they at any time made any recommendations which came as a great surprise to your own testing people?

Mr. CONNELL: Talking only of the four machines of which I have knowledge, I would say no.

Mr. HORNER (*Acadia*): Then, I would like to leave it and go on to another question or two that I have here, Mr. Chairman. This is with regard to getting raw materials. Have you any information for the committee with regard to getting iron ore—and this may be outside of your field, and if it is, do not hesitate to say so because you have it listed in the materials on the charts you gave us. I wondered about this: Has the price of iron ore coming out of the mine increased, or has it remained constant? Has the price of iron ore reaching the steel mills at Hamilton or Detroit, I think it is, increased at those particular points, or are you referring to material here, as you buy it—the rolled product?

Mr. CONNELL: We are referring strictly to materials as we buy them.

Mr. HORNER (*Acadia*): That is iron already made up?

Mr. CONNELL: Yes.

Mr. HORNER (*Acadia*): You have no knowledge as to whether iron ore coming out of the mines has increased? The reason I asked that was that I

think the committee should get some information on this from the D.B.S. or some interested persons, because we have recently had great iron ore deposits discovered in Canada, and we have recently seen that this iron ore is being shipped through the St. Lawrence seaway at a considerable saving. I think that, inasmuch as this inquiry is a study of the conversion of this iron ore to useful material, we should have some information as to whether or not the actual product, when it left the mine, has increased in price or not. I think the committee should take cognizance of that, and perhaps obtain some information on it.

I have a further question, though, with regard to John Deere, and that is: I notice in your brief you said the dealer can have the equipment, and he does not have to pay for it until it is sold. That is only for new machinery?

Mr. TRIMBLE: That is right.

Mr. HORNER (*Acadia*): Parts he pays for within 30 days?

Mr. TRIMBLE: Not necessarily. He can obtain a stock order of parts on which he has a considerable length of time in which to pay.

Mr. HORNER (*Acadia*): I do not mean this as any slur on the John Deere Company, but I have had a number of dealers complain to me about the guarantee. The machine companies are not backing their dealers the way they used to, on guarantees being put on their machines, and if the machine does not stand up, that is the dealer's tough luck. Would you have any comment to make with regard to guarantees, or support for your product with the dealers?

Mr. TRIMBLE: There I think you are speaking of our labour allowance policy, and in our labour allowance we allow the dealer his flat rate cost, his labour cost, plus \$1 an hour.

Mr. HORNER (*Acadia*): For how long do you allow this?

Mr. TRIMBLE: Under the warranty.

Mr. HORNER (*Acadia*): How long are your warranties, generally, or does it vary with different machines?

Mr. TRIMBLE: It varies with different provinces.

Mr. HORNER (*Acadia*): Different provinces?

Mr. TRIMBLE: Yes, sir.

Mr. HORNER (*Acadia*): Why would that be?

Mr. TRIMBLE: You have a statutory warranty in Saskatchewan and Manitoba.

Mr. HORNER (*Acadia*): I see. Can you give us some idea of what that is?

Mr. TRIMBLE: Your Saskatchewan and Manitoba warranty is one year, I think.

Mr. HORNER (*Acadia*): In other words, all new products must be guaranteed by the manufacturer?

Mr. TRIMBLE: Against defects, yes.

Mr. HORNER (*Acadia*): For one year?

Mr. TRIMBLE: For one year.

Mr. HORNER (*Acadia*): This may be getting too trivial, but how long do you guarantee them, say, in Alberta, which has not got that statutory provision.

Mr. TRIMBLE: Our warranty over North America, with the exception of statutory warranties, is six months.

Mr. HORNER (*Acadia*): That is fine.

Mr. FORBES: Manitoba and Saskatchewan are smarter, eh?

Mr. HORNER (*Acadia*): Manitoba and Saskatchewan farmers have an advantage over Alberta farmers there.

I have a further question regarding parts. I am referring here particularly to the John Deere Killifer. I am sure you know what I mean. It is an outfit to move dirt, and in fact a lot people use them to move manure, and it does a good job. But the point I want to bring out is that any farmer in Alberta can buy a blade for your killifer, 8-foot size, for something like \$5 from Nobleford, a manufacturer in Southern Alberta. I don't know if that is the name, but it is in Nobleford, Alberta. They make the same blade which fits the John Deere Killifer for about \$5, and yet to buy a John Deere blade for the same Killifer costs \$30. Now, this, to me, seems to be too big a discrepancy. Surely here is a piece of rolled steel with a certain degree of temper in it, so that it will stand up and hold a good cutting edge, but it is strictly a piece of rolled steel about six inches wide and maybe three-quarters or half-inch thick. There should not be that degree of difference.

Mr. CONNELL: I cannot answer, offhand, what it is. I know nothing of prices of either of the articles. I cannot say what our price is, and I cannot say what the price of the other one is. I don't know that they are the same qualities, the same thicknesses, the same steel. I know nothing of that. I think I would have to have, really, a better example, shall I say, of seeing the blades, comparing them, testing them and seeing if they really are the same blades.

Mr. HORNER (*Acadia*): I realize, Mr. Chairman, that I perhaps placed Mr. Connell at a disadvantage in not having the blade here. This was brought to my attention. I own a John Deere Killifer and know something about it, so I have a little knowledge of what I am talking about. I cannot tell you as to the degree of thickness of the blade, or anything like that.

But it has been often said that parts are expensive and hard to get, and the reason there is such a big market is because you have to retool and run through a special lot of parts. But surely if an effort were made a great deal of it could be done. There is nothing complicated about it, provided the holes are punched at the right distance. They could be stacked up and sold off without any trouble at all. I do not know why there should be that difference, when at Nobleford they can make the same blade. I have been told it fits the same machines.

Mr. CONNELL: I would like very much to dig into that and find out how they can do it so cheaply, because if they can do it, I wonder why we could not do it too. We have made a note of it.

Mr. HORNER (*Acadia*): Massey-Harris said the other day that 18 per cent of their sales were for parts.

Mr. CONNELL: That is reasonable. I would say they would run from 16½ to 17 in the case of our company.

Mr. HORNER (*Acadia*): And they said they were losing three or four per cent on their parts sales to other general manufacturers, such as that particular company I mentioned, or rather the place I mentioned, or to McLeod stores, or somebody. Would you have noticed anything like this?

Mr. CONNELL: If you are referring to Canada, I would prefer Mr. Trimble to answer.

Mr. HORNER (*Acadia*): Take the North American continent.

Mr. CONNELL: For the North American continent, yes. We have a lot of competition from people who manufacture parts for machines which we build. These people, I think we all understand, are the ones who take the cream of the crop. In other words, when a part becomes fast moving, with sales in very large quantities, those are the kind of parts that these people, for want of a better terminology, call them "will fit", manufacture. And they manufacture the parts or else they buy them. They pick only fast moving and high volume parts. But in our case, we not only have these parts, but we must make

parts, as you are well aware, for machines which are 20 or more years old, when many times the cost of simply setting up the machinery with which to build or to make some of these parts is more than the price of the part itself. So we have quite a different thing. We cannot pick and choose. We must build all the parts for our machines.

Mr. HORNER (*Acadia*): Is it not often the case—and I agree that some companies are doing it—but is it not often the case when you have a machine which goes into production, let us say a new model, that you make conversion kits to fit the old one, which enables you more or less to improve the old machine and cut down your parts stock, as you go along?

Mr. CONNELL: I think that is true, yes. I think it would be quite appropriate at this time, if you do not mind my mentioning it, if I should say that for years we have had a pretty good standing rule that wherever a part that is presently in use can be used on a new machine to be produced, then that part is to be used. We have done our very best to standardize, and we hope to do more of it as times goes on. We have a committee which has been actively at work on this over the last five years. We have made some rather significant advances. Not too long ago we had 68 different hose clamps. That is a lot of hose clamps. But today we have cut the number down to six. Then again, we had 49 items. I cannot just think what they were for, because these figures are running through my mind. I was reading a report a little while back. But now the number has been cut down to about seven. In addition, we had 7,000 items of hardware in use in our various plants, but we have now cut that figure down to below 4,000. I think this illustrates the trend, that we are trying to go in the right direction and to standardize all parts.

Mr. FORBES: Do you suggest the price to your dealer for parts and repairs?

Mr. CONNELL: We have a price list which we put out with suggested list prices, but the dealer can sell above or below it, as he sees fit.

Mr. FORBES: What percentage do you suggest that he take?

Mr. CONNELL: Let me put it this way: that if he were to take an average trade discount—let us say, the suggested list price is \$1. The average discount from that is 27½ per cent. That would represent to the dealer, if you turn that around into a mark-up over his cost, it would be 37.9 per cent. In addition to the trade discount we give him a discount for stock orders, and we give him a volume bonus. So if he were to take advantage of just half the stock order discount, plus his volume bonus, that would be equivalent to about 31 4/10 per cent discount from the same price, and it would entitle him, as a mark-up, if he sold at that full price, to about 45 per cent.

Mr. FORBES: Would you care to suggest how much mark-up you would recommend on a new machine?

Mr. CONNELL: We publish a retail or list price and incidentally it is the maximum list price at which our dealers can sell. I know, because this list price is the same in the United States as in Canada. It is the maximum price at which our dealers can sell in Canada. His discount from that is 20 per cent.

Mr. FORBES: You say 20 per cent?

Mr. CONNELL: That is right.

Mr. FORBES: And then he has a bonus?

Mr. CONNELL: There is a volume bonus on top of that; and if we add the two together, the total discount from this maximum price would be 22.8 per cent; or, to represent the mark-up against the cost, it would be 29.5, if it were a straight sale. But we know that many dealers have to take less than that for their goods.

Mr. FORBES: Does this book here represent the prices pretty well as suggested by you?

Mr. CONNELL: I do not know just what book you are referring to. Possibly Jack would be more familiar with it than I am.

Mr. TRIMBLE: They look to be reasonably close, but I would have to check them against our own price list.

Mr. MILLIGAN: When you sell a tractor, it would have your price on it?

Mr. CONNELL: That is the way the farmer can buy it?

Mr. MILLIGAN: And when you get it fully equipped, and when you put on the gear and all the rest of the equipment, is it offered for sale with the same mark-up as the price of a bare tractor?

Mr. CONNELL: It takes the whole goods mark up, not the repair parts mark up.

Mr. HALES: I would like to refer to the sheet showing the percentage of cost compared to the net selling price of the tractor. In the bottom line it says that the net profit is a percentage of the net selling price. I take it that that selling price is your factory selling price.

Mr. CONNELL: That is the selling price to the dealer.

Mr. HALES: All right. Take 1960; but that is when you said you were retooling. So let us take 1959, where it says 11.3 per cent profit on tractors. In other words, if a tractor sold for \$2,000, the profit would be \$226.

Mr. CONNELL: That would be the net profit.

Mr. HALES: For several lines of business that is a very high profit. Take for instance the products of the farmer, which he sells and which go to a food outlet. If they make two per cent net profit on their year's operation, it is considered a good operation. With a packing house, if you have an operation with one-half cent per pound of profit on a year's volume, you are doing good business, and you are making a profit. This seems rather high to me, this 11.3 per cent profit. What is the average price of a tractor now? Would you say \$2,000 was a fair figure?

Mr. CONNELL: I think it would be above that. That is wholesale. I would have to guess at a figure, when you ask for an average price of a tractor. We would have to choose some one example. I would say that probably \$2,600 to \$2,700 would be closer to an average price, for which we would sell a tractor.

Mr. HALES: So let us say \$3,000. Then there is going to be \$300 profit on that one tractor. It seems to me that this type of business, farm machinery, has far too great a net profit, when compared to any other line of business.

Mr. CONNELL: Perhaps Mr. Dain would be good enough to answer your question.

Mr. DAIN: I would like to answer that, if I may, in respect to our total North American business. At the end of 1960 we had approximately \$600 million tied up in one place or another, not counting our retail credit operations in the United States. There are many ways in which to measure profits. The one to which you refer is profit on sales. It is true that our net profit on sales would appear to be higher than those you stated. But it takes many more dollars of resources and investment in inventories, in plant, in equipment and so on to produce this dollar of sales. It is a much higher investment than it takes, for example, for a food chain. So we think, as we have tried to indicate in our brief, that perhaps a fairer way to compare profits between industries is in relation to total resources or total assets that are employed in the business.

Now, when a company is faced with financing its business, it has to get from some source, dollar for dollar, all the resources which it requires to produce its sales volume. You can get those dollars in about five different ways or means; you may get them from your suppliers in the form of accounts

payable; or you can get them from the reserves which you build up to meet contingencies or situations which have not yet occurred. Those two sources would cost you nothing. You do not have to pay any interest charge on them. Then you can get money from the banks in the form of notes payable, or from bondholders in the form of a continuing debt; or from stockholders in the form of equity capital. But each one of these sources creates a cost to the company. So it is within the discretion of management, when it may derive money from these many different sources. In other words, when management can take more of its total funds from debt sources, these are the cheapest sources. So this affects operating costs as far as money goes.

To get on a comparable basis, as one company compared to another company, you have to eliminate this kind of factor. We think that comparing profits against total resources is a fairer measure. And I think you will find that in widely divergent kinds of financing, it is more comparable than when profit is related to sales volume.

Mr. HALES: On the surface it does not just appear right that there is this big mark up in farm machinery, when in foods it is so low; but you have explained some of the reasons why. What would be the total profit on a tractor on this basis of 11.3 per cent figure of profit, and then as to dealer profit?

Mr. DAIN: We do not know what the dealer's profit is. We know what his total mark-up is.

Mr. HALES: Take his total mark-up. What would you figure the two would be together? The manufacturer makes a profit of 11.3 per cent on a \$2,000 tractor, and that would amount to \$226; and then you would add to it the dealer's profit.

Mr. DAIN: I will figure that out for you in just a minute.

Mr. HORNER (*Acadia*): The dealer might object quite strenuously to the committee that 20 per cent is profit.

Mr. KORCHINSKI: You express it as a maximum.

Mr. TRIMBLE: On a \$3,370 list price tractor, it would be \$634.

Mr. DAIN: That is not profit; that is before the dealer has recorded any expenses or charged expenses against his mark-up.

Mr. HALES: Bear in mind that you have taken every specific cost that you can think of and placed it in there, such as depreciation, overhead, and everything.

Mr. TRIMBLE: On our side of the picture, as to the \$337 dealer's profit, we do not know what the profit would be because we would not know what he would sell it for.

Mr. HALES: We are here to try to find out what the problem is. Have you any recommendations to offer this committee as to how the farmer might buy farm machinery at a lower price? Have you any recommendation or suggestion?

Mr. CONNELL: If we were able to reduce our cost right down the line everywhere, there is a probability that prices would go down. If all our costs remained the same, the probability is that prices would not rise; but if costs did rise, I think it is almost inevitable that prices would go up.

Mr. HALES: This is a wonderful opportunity for you to make any suggestions or recommendations.

Mr. CONNELL: What would you have to say about it Jack?

Mr. KORCHINSKI: I wonder if any of the witnesses could give us any indication of whether or not there is any research done, so that farmers would not have to have a lot of their money tied up in so many motors. On a combine we have a motor, and on a self-propelled swather we have a motor, and on a tractor we have all kinds of motors; yet these motors are used for only three or four weeks in a year.

And another thing; take the case of tires. I know there are all kinds of tires around our farm. It is my belief that many of these tires simply wear out, not from use, but because they just stand around. I know in many cases they just fall apart after a period of years. They just seem to disintegrate. I wonder if you have given any consideration to the standardization of equipment, or if you have done some research so that farmers would not have to spend so much on machines which they do not use to the maximum degree. In the first place, a lot of farmers might use older tires, and this is fine. But when they go to change those tires, they may find that there has been a change in the size of the rim, and those old tires will not fit on the new rims. Is it not the case that you switch your rims around from year to year?

Mr. TRIMBLE: One of our biggest problems is to determine when to go from a 16 to a 15, or to a 14 inch rim, because of the facts that you mention, that the farmer has a lot of 15 inch tires. So the question is, when is he going to use a 15 inch tire or a 14 inch tire in the newer machines? It is a problem as to when we should switch the rims on a machine so that you can make use of these old tires.

Mr. KORCHINSKI: And another problem arises when you will find one rim with five holes in it, and another with only four, or another with as many as six. They never fit. You can examine any old baler and you will find the same problem.

Mr. TRIMBLE: Are you not talking about wheels rather than rims? We use tractors with demountable rims wherever possible.

Mr. KORCHINSKI: If you mount a tire on a rim, would it be classed as a wheel?

Mr. TRIMBLE: The rims will mount a tire, whether there be four or five holes in them.

Mr. KORCHINSKI: The point is that here you have one with six holes and it will not mount.

Mr. COOPER: I think he has reference to the hub shoulders.

Mr. MONTGOMERY: I would like to follow up on Mr. Hales' point. Taking the year 1959, on the first sheet it shows a net profit of 11.3 per cent. I notice there you show net selling price f.o.b. factory 100. What I want to get at is this: you are assuming on that that you will build and sell so many tractors. Suppose you do not sell the number of tractors you expect to sell, or suppose you were giving bigger discounts, have you taken into consideration here these discounts you give to your dealer in the expenses of 88.7 per cent? I understand that a small dealer gets twenty per cent and a large dealer would get a larger discount. Is there a possibility of this 88.7 per cent not covering all of this cost and meeting all of your losses on tractors if they do not sell?

Mr. CONNELL: That is the total cost.

Mr. DAIN: These are actual costs and not standard costs predicated on volume.

Mr. MONTGOMERY: We can depend on your making 11.3 per cent.

Mr. DAIN: We did in that year.

Mr. MONTGOMERY: What about 1956?

Mr. DAIN: We had a strike in that year for about three months.

Mr. HORNER (*Acadia*): My first question is on advertising. When the International company was before us they made some surprising statements to me. I am sorry I was not here to question them later. In looking up their answer I find that it still seems surprising. They said that seven farm publications charged \$10,850 for advertising on one page in black and white. To me this sounds like a combine in the advertising business, if seven companies

charge that for one page. They listed the seven companies. I am wondering whether or not in your advertising you have had any similar experience?

Mr. CONNELL: I am sorry, but I have no information on the breakdown of what our advertising expenditures are. I know what the total is, but I do not know what they pay per page for space now compared to what it might have been some years back.

Mr. HORNER (*Acadia*): The surprising thing to me is they listed the seven farm papers. It appears to me that perhaps the combines investigation branch should look into this, unless there is a legal combine existing.

Mr. CONNELL: I have no evidence. Undoubtedly the evidence is available in our advertising department.

Mr. DAIN: I am sure it would cost us as much as International.

Mr. HORNER (*Acadia*): I wonder if you could tell me if you have any idea of the percentage of the dollars you are spending on advertising.

Mr. CONNELL: As a percentage of net sales I could give it to you. I can go back as far as 1954 if you like.

Mr. HORNER (*Acadia*): Yes.

Mr. CONNELL: In 1954 it was 1.3; 1955, 1.1; 1956, 1.5; 1957, 1.2; 1958, 1.1; 1959, 1.0; and in 1960 it was 1.3.

Mr. HORNER (*Acadia*): In other words your advertising expenditures have remained relatively constant for the past six years?

Mr. CONNELL: Yes, as a percentage of sales.

Mr. SOUTHAM: I have had a little bit of experience in advertising newspaper rates. This might throw some light on the question. I believe that by some agreement or legislation a magazine over a certain circulation can charge a certain rate per inch of newspaper column. It is quite likely that these people in picking out a particular periodical come within this scope of a minimum circulation. Consequently the rates would be approximately the same in all cases.

Mr. HORNER (*Acadia*): This enlightens me a great deal. I have a question in respect of advertising, dealing with a trip John Deere paid for their dealers.

Mr. CARON: The trip to Dallas?

Mr. HORNER (*Acadia*): Yes.

Mr. DAIN: That would not be included in advertising.

Mr. HORNER (*Acadia*): What would you write that off as?

Mr. DAIN: This was in the figures on sheet No. 4 which jumped from nine to seventeen per cent. I would not want to imply that this was all attributable to Dallas; but Dallas is in there. I should say, however, that the dealers did pay a portion of their own cost of the trip to Dallas.

Mr. HORNER (*Acadia*): I do not think the dealers paid too much.

Mr. DAIN: I should say also that our normal advertising budget in 1960 was reduced notably to absorb a good part of the extra cost of the Dallas show.

Mr. KORCHINSKI: If the dealer paid part of it he would have to get the money back and charge the buyer more.

Mr. DAIN: We hope he would sell so many more tractors that it would not be necessary.

Mr. HORNER (*Acadia*): We have had evidence before us that perhaps a price tribunal should be in effect to which you would apply for permission to increase your prices. Do you think there would be any danger of this slowing up the development of new techniques or new methods in respect of machinery?

Mr. CONNELL: I think if it were to cut us down to the point where we could not make a fair profit with the goods we sell, unquestionably it would have this effect on the development of machinery.

Mr. HORNER (*Acadia*): In other words, a price tribunal also would have to control your other expenses such as material and labour?

Mr. CONNELL: Yes. It would have to be a case of wage controls as well as price controls.

Mr. HORNER (*Acadia*): This is what I thought, too. Companies are always being condemned for having too many model changes. I will excuse you for your recent change from two cylinders to four cylinders; I never did like two cylinders anyway. A little while ago you had a change from an 820 to an 830. Can you give this committee some idea of the reason for this particular change, and what changes actually were made?

Mr. CONNELL: I am not an engineer. I will have to go back to a survey made in 1952. This deals with the tractor you are speaking about. At that time this survey conducted by an independent group revealed pretty clearly to us that the only ones who wanted two-cylinder tractors were the ones who already owned them. Primarily these were the older farmers; the younger ones on the farms wanted fours and sixes.

About the mid-1950's we began to do something about it. At that stage we began developing the tractor which we are now marketing as the 2010, the 3010, the 4010, and so on. In the meantime, while we were doing that, there was the matter of staying alive. We had to bring into the field the 820 which replaced the 80; the 80 had replaced the R a long time ago. In order to keep up with the field as best we could with the model of tractor we had, and the only one we had, until we could come out with the fours and sixes, we had to make additional small changes in the 830. I am not prepared to tell you exactly what those changes were; I am not an engineer. However, they were changes which went beyond style; there were some functional features in the 830 that the 820 did not have. Our change in those years was an endeavour to stay in the market until we were ready to come out with the new tractors.

Mr. HORNER (*Acadia*): If you want to change something just a little, could this not be done without coming out with a bunch of ballyhoo that it is a new model.

Mr. CONNELL: Frankly, this is done in many instances.

Mr. HORNER (*Acadia*): I am going to read an extract from the report of the royal commission on agriculture and rural life. This is a summary dealing with mechanization and farm costs and has to do with model changes. It says:

Repairs must not only be available for the 75 sizes and types of tractors sold this year, but also for the different sizes and models sold in years past.

It goes on to say that every time the models are changed a new set of parts has to be kept in stock by the dealers and the implication is that this continual piling up of stock on the part of the dealers makes it very difficult and perhaps increases his costs to some extent.

Mr. CONNELL: I do know that when we came out in 1960 with a completely new line of tractors this probably brought more new parts into the line than any changes we had made for many many years. I can go back to our 830, 820, 80 and R, and if you were to check back through the price books on other parts you would find that the great percentage of the parts used on the model "R" were still in use on the model 830.

Mr. HORNER (*Acadia*): In other words, the parts do not change completely every time a model changes?

Mr. CONNELL: No.

Mr. HORNER (*Acadia*): Could you give the committee some idea as to why a diesel motor may cost as much as \$800 to \$1,000 more than a gas motor for a similar tractor?

Mr. CONNELL: I cannot tell you from an engineering standpoint, but only from the standpoint of having seen the costs and knowing that the costs are greater. The costs in our case would not range anything like the figures which you mentioned. Our smallest one is the 1010 and sells for \$500 more; the larger sizes from \$525 to \$600 more.

Mr. HORNER (*Acadia*): Are you taking 20 per cent on that again?

Mr. CONNELL: No, this is retail that I am talking about.

Mr. HORNER (*Acadia*): Well, I do not know. I realize that diesel fuel can be purchased cheaper by a farmer. But I hope there is some other reason you could give us as to why a diesel tractor should be priced higher.

Mr. CONNELL: I think this will be of interest to all of us. The other day I was interested in learning what percentage of tractors are going to diesel. The only reason we ship diesels out is because somebody wants to buy them. Here are the figures. In 1958, 1959, and 1960—in those years for the 730 model tractor—17.3 of them were gasoline in 1958, 13.8 per cent in 1959, and then it dropped down to 9.9 per cent in 1960. Now, as to diesel. In 1958 62.8 per cent of all the 730 sales were diesel.

Mr. DOUCETT: What year was that, please?

Mr. CONNELL: By 1959 it had increased to 74.3 per cent, and by 1960, with this model tractor, it increased to 77.5 per cent. The difference between the two, is the LP gas, which showed the same kind of decline as the gasoline.

Mr. HORNER (*Acadia*): Was the LP gas tractor more expensive to use?

Mr. CONNELL: Yes, it costs more than the gasoline, but I believe it is less than the diesel.

Mr. HORNER (*Acadia*): I can understand that you would have to provide a pretty good tank for the gas on a LP tractor, but you could put that tank on an ordinary gas tractor, or a gas car, and we might go out into the field and it would operate very well. But why would it cost a difference of \$400? I am just guessing.

Mr. DAIN: The compression ratios for a diesel tractor are much higher than they are for a gasoline tractor. It requires a more rugged type of engine, and a more expensive fuel injection system. In addition, the tolerances of the manufacturer's specifications for a diesel injection system are much finer and more costly than for a carburetion system in a gas tractor.

Mr. HORNER (*Acadia*): You would say that there is much more refined and highly skilled work which goes into a diesel as compared to a gas engine?

Mr. DAIN: Yes.

Mr. TRIMBLE: In one case you have just the one carburetor, while with the injection system you have to have an injection pump for each cylinder.

Mr. FORBES: In trying to arrive at the cost of machinery, Mr. Hales referred to the cost of a tractor, and the dealer's mark-up on a \$2,000 tractor. That would not be for a very popular sized tractor. That would be for your 730, which would cost in the neighbourhood of \$5,000. Would the mark-up be the same on a \$1,000 tractor, as it would in the case of a \$5,000 tractor? Why should your company not say here, that if you are selling machines over \$3,000, your mark-up should be only 10 per cent? That in itself would reduce the cost of machinery quite a bit. At the present time you have two price systems; you have one price here between the wholesaler and the dealer, while the dealer has another price from there on. Unless you have something to

trade in, it is a cash price; and it is that part of the problem which increases the cost of the machinery.

Mr. TRIMBLE: I do not think you could do that. Your dealer's commission, or your dealer's net profit, now is very small. If you ask if the commission on a \$5000 tractor is the same as it is on a \$1000 tractor, the answer is yes, that is correct.

Mr. FORBES: You mean it is at the same rate?

Mr. TRIMBLE: That is right. Trade-ins ordinarily are priced much higher. He has possibly much service work to do there. Then there is his delivery cost, and his cost of doing business; and moreover, he sells fewer of them.

Mr. FORBES: He has quite a mark-up when he buys one of those big combines, and I do not think there is any more problem with a \$5000 tractor than there is with a \$2000 tractor.

Mr. CONNELL: I cannot answer that either. But I do believe that the dealer is entitled to earn a reasonable profit, and I think that based on past experience, and on what they are doing today, if we were to attempt to cut them down, so that on the larger sized models of any machine they would only get one-half of what they get today, I do not think we would have many dealers in business very long, or any who really wanted to go into the business.

Mr. DAIN: If you assume that the dealer is now making a fair profit, and you introduce what you say you would reduce his mark-up on the larger tractors, then, in order to make a fair profit, he would have to charge a higher mark up on his smaller tractors.

Mr. FORBES: I think that their mark-up all the way across the line is plenty high enough. But that is what we are going to get at.

Mr. PETERS: I would like to ask a question on other fields. My first question is this: what is the relationship in your company between industrial sales of certain types of your tractors, and farm tractors? I am thinking particularly of companies like H and S in Ontario who buy hundreds of your small crawler tractors for bush operations. This must have some influence on the cost of producing them, because it is not in the agricultural field. The volume is largest in that field.

Mr. TRIMBLE: I cannot go by a particular dealer; but in so far as our overall sales in Canada are concerned, only eight per cent of our sales were for industrial use.

Mr. PETERS: In other wards, it is not much of an advantage as far as the farm section is concerned?

Mr. TRIMBLE: No.

Mr. PETERS: What is the difference in price in those two fields?

Mr. TRIMBLE: Only in so far as they are heavier equipment, or different equipment; the tractor—the agricultural crawler tractor does not have the same protective equipment on it as does the tractor which is sold for use in the woods, but the mark-up is the same.

Mr. PETERS: Another question is this; why would your company or any other company be producing agricultural equipment in Canada at all? You point out that wages are a large factor. I was interested in the statement made this morning in relation to tractors on one of the supplementary pages which you gave us. The comment by labour is continually that automation has made a difference in the number of people being employed, and that they are less, and that there is a relationship between this and the sales of the company and the wage picture itself. Is this the reason? What is the reason, or what do you contemplate is the reason?

You note that in 1956 the percentage of wages has gone up to 19 per cent, because there was a strike; and obviously when there is a strike there is no labour involved for the period of the strike. Then you go on to the second strike in 1960, where your labour content goes up to 27 per cent of the cost of production. Does that not indicate that poor management in many cases may be a large factor in the matter? It would seem to me that you have less overall labour cost during the time when there is a serious labour dispute because there are no wages being paid at all. Yet, so far as the work is concerned you say that in this case it is almost double what it was in 1959 for weekly wages in the plant. How do you explain it? How do you explain taking this amount in and covering it up to such a large extent? How can you explain it to the farmer, if you did not have that much wages?

Mr. DAIN: It is often assumed that direct labour is a variable cost. But it is not. When we shut down a plant because of a change in tooling, or because of a strike, there are still people working in that plant. This was particularly true of 1960. Much of the machinery had to be moved around and tried out, and the people had to be paid. It is true that when the union people are not working they are not getting their weekly cash wages; but operation costs are still going on, such as pension costs, supplementary benefit costs, and so forth; they are all going on, all of which tends to reduce the effect you are talking about.

Mr. PETERS: Is it not true that the charge that is made, the contention that is made, that the lower number of units there are, probably also it is true the lower the amount of overall labour cost in the plant; but the percentage will rise very rapidly, even though there is no total decrease in the labour pool.

Mr. DAIN: That is true, yes.

Mr. PETERS: So with poor management, if we are manufacturing farm equipment in Canada, and we are playing around with the concept of an international market,—and most of the machinery companies have come to the point of not being Canadian companies, but come to us as American companies—and in the one case you mentioned this morning when you pointed out that even from our own Canadian factory that we are producing more than twice as much of the production that is going into the United States, than is going into Canada, so that we are really not dealing in the Canadian scene at all.

Mr. DAIN: Not as far as costs go, no.

Mr. PETERS: We are being the victims, in some cases, of international operations.

Mr. DAIN: Except that costs in Canada—the percentage of the selling price as shown on these sheets—are not too different from the United States prices.

Mr. PETERS: Yet the wages are quite different; they are 25 per cent different.

Mr. DAIN: The hourly wage cost between the United States and Canada is about 15 per cent different, and this is a relatively small proportion of the total cost.

Mr. PETERS: Then why is not this 15 per cent difference reflected in the price of the Canadian made product? What would we have to do, as a committee, to take advantage of the wage environment in which we live in relation to the plant production?

Mr. DAIN: It is reflected in the cost of the product. The Welland products are priced on Welland costs. If the same products were made in the United States, and cost more, they would have to bear the United States cost.

Mr. PETERS: Why do all these companies not come into Canada and have all their production in Canada? Why do they not do their manufacturing in Welland, where they would be very close to Hamilton, where they would be very close to sources of supply of raw materials, and where labour costs are lower than in the United States? Why is it not advantageous for all the manufacturing companies to situate in that locality?

Mr. DAIN: If we made all our goods in Welland the final cost to the farmers would be higher. Distribution costs would be higher.

Mr. PETERS: But in your brief you quote prices—f.o.b. prices, so we pay the costs anyway.

Mr. DAIN: If we moved all our production to Welland and our competitors stayed in the midwestern states then the Canadian farmers in the western provinces could buy their products cheaper than ours.

The CHAIRMAN: I should like to interrupt for a moment. I think the witnesses have been excellent and they have made an excellent submission. They have been very cooperative, as have been some of the members today. I wonder if we could continue this cooperation as the witnesses would like to catch a train shortly after five o'clock. I would ask you to confine your questions to the minimum, and let them get away.

Mr. HORNER (*Acadia*): I have more questions, even though I do not want to hold the witnesses.

Mr. HENDERSON: They will miss their train.

Mr. HORNER (*Acadia*): My questions may not be that important but I want them put, whether they miss their train or not. There are a lot of trains running. At the bottom of page four of the brief, and at the top of page five you state:

In 1959 we had net sales of approximately \$542 million and a net profit of about \$48 million.

Now, by doing a little rapid calculation, taking that \$48 million from \$542 million you get \$494 million. Then, at the top of page five you say:

If we had sold the same products at 1950 prices in 1959, our sales would have been \$393 million and we would have had a loss of about \$47 million.

Add that \$47 million to the \$393 million and you get \$440 million. There is a difference of \$54 million, which is your cost figure, or am I reading the figures incorrectly??

Mr. DAIN: The effect of the income tax on profits would account for the difference.

Mr. HORNER (*Acadia*): In your chart you attribute income tax as a cost, which maybe the committee should accept if you are fortunate enough to do that. Maybe it is a cost. I am not going to debate that but, for the year 1954, you attribute income tax for tractors as a cost item as 11.1 per cent. Going down to combines the income tax was 5.6 per cent, and going to balers the income tax in 1955 was 13.4 per cent. Why should the figures have varied?

Mr. CONNELL: That is as a percentage of the income tax to the selling price of the particular machines. The whole chart is a percentage of cost on the selling prices.

Mr. HORNER (*Acadia*): This is just an example. The income tax on tillers in 1955 was —7.6 per cent. What does that signify?

Mr. DAIN: That is a carry over from previous years. You get a tax credit if you have a loss.

Mr. HORNER (*Acadia*): If there was a tax carryover, why was it only applied to tillers?

Mr. DAIN: We do not normally analyze our accounts in this way. We have tried to provide it by machines here in order to provide the information you asked for.

Mr. HORNER (*Acadia*): But this assumes that in the year 1955 you made no profit at all on tillers?

Mr. CONNELL: We, in fact, showed a loss that year.

Mr. HORNER (*Acadia*): On the whole company's operations.

Mr. DAIN: On that one plant.

Mr. HORNER (*Acadia*): On the Welland plant?

Mr. CONNELL: Yes.

Mr. HORNER (*Acadia*): This would apply just to the Welland plant?

Mr. CONNELL: Yes. You can check back to the other sheets and see that.

Mr. SOUTHAM: With reference to cabs on machines, you have mentioned that approximately 60 per cent of your sales are in the United States. Now, as members of the committee have found out during the last week or two, if a machine comes across from the United States into Canada and has a cab on it there is no tax, but if the cab is left off and a Canadian farmer decides to purchase a United States tractor then he has to pay \$21 or \$22. May I ask how many of your customers are purchasing these combines which have cabs? It might assist us to eliminate that.

Mr. CONNELL: First of all, I cannot tell you how many are sold with cabs, either in the United States or Canada. Maybe Mr. Trimble knows but, if we were to make it a standard part of the combine, we would increase the price of the combine to those who do not want cabs. Therefore, we prefer to manufacture it as an optional.

Mr. SOUTHAM: In other words, it is company policy?

Mr. CONNELL: Yes, that is correct.

Mr. SOUTHAM: It does create a problem whenever a Canadian buys a machine without a cab.

Mr. HORNER (*Acadia*): How many of these combine cabs do you sell in Canada? Would there be 50, 25 or what?

Mr. TRIMBLE: About 50.

Mr. DAIN: The overall production would be 200 or 300.

Mr. KORCHINSKI: Could we have the financial report for last year included as part of the evidence which the witnesses have submitted? Does it require a motion to that effect?

Mr. CONNELL: Here it is.

Mr. KORCHINSKI: I would suggest that it be incorporated as part of the evidence.

Mr. HORNER (*Acadia*): That was not done with the others.

Mr. KORCHINSKI: That has been done.

The CHAIRMAN: I do not believe so.

Mr. KORCHINSKI: I did not see this financial report.

The CHAIRMAN: Are there any further questions?

Mr. HORNER (*Acadia*): Of course I have more questions.

Mr. KORCHINSKI: I think the financial statement for Massey-Ferguson was included as an appendix. I believe a motion was passed. Is that not right?

Mr. GUNDLOCK: Yes.

Mr. CONNELL: You are welcome to it.

Mr. KORCHINSKI: I would make a motion to have it incorporated as part of the evidence.

The CHAIRMAN: We shall see if it was incorporated.

Mr. KORCHINSKI: I am making a motion.

Mr. FORBES: I second it.

The CHAIRMAN: Is it agreeable that it be incorporated in the evidence?

Mr. HORNER (*Acadia*): Can it be done, pictures and all?

The CHAIRMAN: It can be done but it would be very expensive. I think the committee would just want the financial statement.

Mr. HORNER (*Acadia*): Is that good enough, Stan?

Mr. KORCHINSKI: Yes.

The CHAIRMAN: Is it agreeable that it should be printed as an appendix?

Some hon. MEMBERS: Yes.

Mr. SOUTHAM: I think I made the motion that the Massey-Ferguson financial statement be incorporated with the evidence.

Mr. HENDERSON: While other members of the committee are looking at those figures I should like to tell the witnesses that we had the dealers before this committee, and you never saw such crying in your life. I come from the Peace River country and I told them about the old fellow who landed here after coming from a trip around the world. Your fellow, Kayo Aspol, made half a million dollars in the Peace River country in the implement business.

Mr. TRIMBLE: Kayo made part of that in the real estate business as well.

Mr. HENDERSON: He has got a million dollars now and he is building a big hotel.

Mr. HORNER (*Acadia*): My question has to deal with volume. I notice that according to a chart your volume has been relatively constant over the past ten years. I think its low point was in 1954 or 1956 and its high point was in 1959, but the significant thing to my mind is that prices started to go up in 1955, and rose sharply. In fact, taking the year 1947 as a basis for one hundred, the farm machine index rose 50 per cent from 1955 on. Do you think that your volume of sales have reached your volume of production? In other words, have they, generally speaking, reached that point of efficiency?

In other words, greater volume would not decrease the price to a sharp amount, or would it?

Mr. DAIN: Mr. Horner, at the same time, in this period between 1954 and 1959, the two census years in the United States, the number of farms was decreasing eighteen per cent. This is a substantial factor which affects volume.

Mr. HORNER (*Acadia*): Yes; but as in lot of other things there is a point of efficiency at such and such a volume.

Mr. DAIN: We have gotten to the point where it is practically impossible to increase the volume of the industry substantially by reducing prices first and hoping the increased volume will pick it up; it just is not there to get.

Mr. HORNER (*Acadia*): The prices have gone up sharply since 1955. They went up last year in all other commodities the farmers have to buy. I notice your volume also has increased from 1956 to 1959. Do you feel that your volume of production is at an efficient level?

Mr. DAIN: We could do better if it were higher.

Mr. HORNER (*Acadia*): In other words, if you had a greater volume of production your costs would go down?

Mr. DAIN: That is true.

Mr. HORNER (*Acadia*): Why did this not happen? From 1956 to 1959 your volume went up but prices also went up?

Mr. DAIN: The costs went up faster.

Mr. HORNER (*Acadia*): I realize that costs went up. I suppose your volume never increased sufficiently to take care of the increased costs.

Mr. DAIN: Yes.

Mr. MILLIGAN: Were you putting out a longer line of machines?

Mr. DAIN: That is part of it.

Mr. HORNER (*Acadia*): It has been recommended to the committee that perhaps the farm machinery industry should be nationalized and that with increased volume prices would come down. I know that in operating a farm, if you have a low volume of wheat it may cost a lot to handle it; but if you have quite a bit you can handle it at relatively low cost because you have larger augers, larger dump trucks and other things. If your volume increases the costs remain relatively the same.

If you were the sole manufacturing agency of farm machinery in the North American continent—and you have already answered me that you would produce nearly as many models as you are now—would your costs go down?

Mr. DAIN: What you would have to do is to include the cost of doing away with a good many of your farm machinery plants and paying unemployment benefits to a good many people who are now in the farm machinery industry.

Mr. HORNER (*Acadia*): I realize my question probably is hypothetical and difficult to answer.

We had evidence before this committee that over the years the number of manufacturers to some extent has been going down. In recent years in Canada we have had a number of manufacturers cropping up. Have you anything to say in respect of the United States?

Mr. DAIN: There are still approximately eleven or twelve hundred farm machinery manufacturers in the United States.

Mr. HORNER (*Acadia*): They manufacture everything from a power mower to a tractor, I suppose.

Mr. DAIN: I am not sure if that would include the so-called garden equipment. This is just farm machinery. Of course, many of them do not make more than one type of farm machinery.

Mr. HORNER (*Acadia*): I know there was evidence before this committee that the percentage of manufacturers is decreasing and that in fact there are only nine in the U.S. and in Canada; but more recently we have had a number of small companies coming into Canada and perhaps some of them are setting up shop here. Could you give us any idea whether the percentage of the Canadian market is decreasing or holding its own? I do not want definite percentages.

Mr. TRIMBLE: You could figure that from the figures in the brief. I think it is increasing slightly.

Mr. MILLIGAN: You mentioned there were fewer farms during the last census. That trend is still increasing. Do you think the production of machinery will drop accordingly?

Mr. DAIN: In respect of unit sales, yes. That has been the trend for the last ten years.

Mr. MILLIGAN: The trend is that your production will not be as great as years go on and as the number of farms decreases.

Mr. DAIN: In tonnages, yes.

Mr. MILLIGAN: That might increase the price of the machines.

Mr. DAIN: We hope not.

Mr. HORNER (*Acadia*): What do you consider the average number of hours your tractors are worked on the farm in North America or in Canada?

Mr. KELLOGG: It depends on the type of crop and the area of the country. In a small grain area I suspect it would be 800 to 1,000 hours maximum. In the areas of heavy plowing where there is a great deal of self propelled equipment I expect that a great many of the tractors are not used more than 200 or 250 hours.

Mr. HORNER (*Acadia*): I have a publication here which says that in 1947 twenty per cent of the tractors purchased were diesel. It goes on to say that about one in ten farmers works a tractor over 800 hours a year. Would you agree with that?

Mr. DAIN: Yes.

Mr. PETERS: I am wondering if your company has given any consideration to situating a new plant in western Canada in conjunction with the steel industry in Regina.

Mr. DAIN: I would have to say no.

Mr. PETERS: Will they give consideration to it?

Mr. HORNER (*Acadia*): There is a steel plant in Alberta too.

Mr. PETERS: There is a trend to take the steel industry into an area which is considered to be the most advantageous market. Is consideration being given to locating your plants in that area for the purpose of eliminating transportation problems?

Mr. DAIN: I will not say that we refuse to consider anything; but I would be very skeptical that it would be more economic to manufacture combines in western Canada, for instance, because we would have to ship a larger percentage of our product a greater total number of miles back to the United States than is necessary now from the present location. You also would have to include that somebody would have to pay for the cost of relocating the plant in another place, which would be tremendous.

The CHAIRMAN: Gentlemen, I believe we are ready to adjourn. On behalf of this committee I wish to thank Mr. Connell and the members of the John Deere Company for being with us today. I believe they have been excellent witnesses. Also the committee has been very cooperative.

Mr. CONNELL: Thank you, Mr. Chairman. It has been a pleasure to be here.

The CHAIRMAN: We will adjourn until Friday at 9.30 when representatives of the Saskatchewan wheat pool will appear before the committee.

APPENDIX "A"

SUMMARY COMPARISONS...

1935 Model "B" and 1961 Model "2010" TRACTORS

ENGINEERING COMPARISON

In addition to the extra power, work output and efficiency of the 1961 "2010," as shown at the right, its price also includes the following engineering improvements over the 1935 Model "B":

Synco-Range Transmission
Variable-Horsepower 4-Cylinder Engine
Dual Speed "Live" PTO
Transmission "Park" Position
12-Volt Electrical System
Hot-Spark (8-Volt) Starting
Key-Switch Safety Start
Engine Ventilation
Exhaust Valve Rotators
Bypass Cooling System
Foot-Operated Clutch
Individual Disk-Type Brakes
Speed-Hour Meter
Handy Mowing Step
Roomy Standing Platform
Adjustable Cushion Seat
Full-View Instrument Panel
Wipe-Manual Service Reminder
More Convenient Implement Attaching Points

Additional improvements over the 1935 Model "B" are available as extra equipment as shown on the previous two pages.

	1935 MODEL "B"	1961 "2010"	Percent Changes		
1. POWER COMPARISON					
Maximum Drawbar Horsepower	12.37	39.00	+215%		
Maximum Belt for PTO Horsepower	16.76	45.00	+168%		
2. WORK OUTPUT COMPARISON					
Plowing	One 14-inch bottom	Three 14- or 16-inch bottoms			
Disk Harrowing	10-foot single-action	8- to 9-foot double-action			
Planting	Two row	Four row			
Cultivating	Two row	Four row			
Rotary Hacking	Two sections	Four 3-1/2-foot sections			
Mowing	Up to 25 acres	Up to 35 acres per day			
Mowing-Hay Conditioning	Non-available	Up to 35 acres per day			
Raking	3 mph	7 mph			
Corn Picking	One row	Two row			
Corn Shelling	Non-available	Shells at time of picking			
Corn Snapping	Non-available	Two row

Rolling	Engine-driven	PTO operated			
Rotary Cutting	Non-available	7-1/2 feet			
Combining	Non-adaptable	9-foot PTO operated			
Cotton Picking	Non-available	Up to 8 acres per day, equating 25-30 hand pickers			
Cotton Stripping	Non-available	Two row			
Baling	Non-available	PTO operated			
Manure Loading	Non-available	1600-lb. capacity			
Manure Spreading	Non-available	134-bushel capacity			
Forage Harvesting	Non-available	PTO operated			
Grain Drying	Non-available	400-bushel an hour			
Saw Removing	Non-available	7- to 9-foot snow plow			
Seeding	Non-available	20-inch penetration			
	2455 pounds	4600 pounds	+87%		
3. WEIGHT COMPARISON					
4. FUEL ECONOMY COMPARISON					
H.P. Hours per Gallon (rated drawbar load)	6.39	Official Nebraska Test Figures Pending			
5. PRICE AND COST COMPARISONS					
	1935 Model B 1935 Dollars	*1961 Dollars	*1935 Dollars	1961 Dollars	Percent Changes
PRICE					
Base Tractor	\$520	\$1144	\$946	\$2122	
Add 100 Rubber Tires	136	305	Included	Included	
Starter and Lights	60	135	Included	Included	
Two-Piece Pedestal	17	38	Included	Included	
Total	733	1644	946	2122	+289%
COST					
Cost Per Maximum Drawbar Horsepower	\$59.26	\$132.90	\$24.76	\$54.41	-59%
Cost Per Maximum Belt Horsepower	\$43.74	96.09	21.02	47.16	-52%
Cost Per Pound at Shipping Weight	.30	.67	.21	.46	-31%

*As of February 1961, the 1935 price for the Model B Tractor was translated into 1961 dollars by multiplying the 1935 price by 2.543. This multiplier was obtained by dividing the February 1961 Wholesale Price Index for "Agricultural Machinery Including Tractors," as published by the U.S. Bureau of Labor Statistics, 1958 (1947-49 = 100), by the 1935 index of 1. The 1935 price of the 1961

"2010" Tractor was obtained by multiplying the February 1961 price, \$2122 by 0.645 which is the quotient of the B.L.S. index of 47.3 for 1958 divided by the index of 148.5 for February 1961. The result in both cases is a price corrected for the general decrease in the value of the dollar between 1935 and February 1961 in the wholesale farm machinery sector of the U.S. economy.

The "2010" could not have been built in 1935. It incorporates latest developments in gear train design, hydraulics, and features as well as new types of materials. A 1935 price for the 1961 "2010" is calculated for comparison only.

Common stock—at stated value (\$1 par value per share)—authorized, 10,000,000 shares; issued and outstanding, 6,901,000 shares..	91,864,471	91,864,471
Earned surplus (Note 2).....	261,122,851	237,171,639
Total common stock and earned surplus.....	352,987,322	349,036,110
TOTAL.....	\$597,188,434	\$621,881,252

The accompanying notes to the financial statements are an integral part of this statement.

1. All wholly-owned United States and Canadian subsidiaries except John Deere Credit Company are consolidated herein. A balance sheet of John Deere Credit Company is shown separately on Page 25.

The investments in and advances to unconsolidated subsidiaries as of October 31, 1960 and 1959, carried at cost less reserves, are summarized as follows:

	October 31	
	1960	1959
John Deere Credit Company.....	\$ 40,521,734	\$ 28,010,572
John Deere Intercontinental, S. A. (Incorporated in Venezuela).....	23,743,546	18,157,811
John Deere-Lanz A. G. (Incorporated in West Germany).....	14,385,406	10,388,970
John Deere S. A. (Incorporated in Switzerland).....	1,444,902	—
Total carrying value.....	\$ 80,095,588	\$ 56,557,353
Approximate excess of the Company's equity in the net assets of the unconsolidated subsidiaries over its investment therein as shown above.....	\$ 5,500,000	\$ 3,500,000

The Company follows the conservative practice of charging consolidated net income with the loss of any subsidiary not consolidated but does not include in consolidated net income any earnings of unconsolidated subsidiaries, other than income offsetting prior losses charged to income, until they are received as dividends; no dividends were received from any unconsolidated subsidiary during 1960. If net income of the unconsolidated subsidiaries was included in consolidated income, it would result in increasing the latter by approximately \$2,000,000 in 1960.

2. Under the most restrictive terms of any of the indentures covering the Company's debentures, \$84,712,941 of the consolidated earned surplus balance of \$261,122,851 at October 31, 1960 was free of restrictions (involving the amount of consolidated earned surplus and also certain ratios of assets to liabilities) as to payment of dividends or reacquisition of the Company's stock.

The 1945 and 1952 indentures require the redemption annually of varying amounts of $2\frac{3}{4}$ and $3\frac{1}{8}$ per cent debentures. The 1961 requirement to retire \$2,050,000 principal amount of these debentures has been fulfilled.

The 1958 indentures requires the redemption annually of \$2,700,000 principal amount of $4\frac{1}{2}$ per cent subordinated debentures beginning in 1965.

3. Since 1950, substantially all of the inventories owned by Deere & Company and its United States subsidiaries have been priced at cost on the "last-in, first-out" method. Inventories of the Canadian subsidiary have been priced generally at the lower of cost or market on a "first-in, first-out" basis.

4. The provision for depreciation amounted to \$17,575,354 in 1960 and \$14,541,289 in 1959. Included in the 1959 amount is \$1,148,123 representing amortization of facilities written off over a five-year period under Certificates of Necessity issued by the Federal Government to the John Deere Chemical Company. There is no similar amortization included in the 1960 figure.

5. Past service costs of a noncontributory pension plan established in 1908, as amended, which have not been founded or provided for in the reserve for pensions or otherwise were approximately \$19,400,000 as of October 31, 1960 and \$18,400,000 as of October 31, 1959.

The Companies have complied with all funding provisions applicable to the plan and for the years 1960 and 1959 paid \$9,477,764 and \$10,935,196, respectively, to the pension trusts and pensioned employees to cover service requirements of the plan. The payment for 1960 applicable to the pension trust for United States employees was made in December, 1960 and is included in current liabilities on October 31, 1960. Of the amounts paid, \$9,077,764 in 1960 and \$9,411,887 in 1959 were charged to costs and expenses in those years, and the remainder was charged to pension reserves previously created from income.

6. On April 26, 1960, stockholders of the Company approved an incentive stock option plan by which 335,000 shares of the Company's common stock are made available for option for the period ending December 31, 1970. Options are to be granted annually at an option price equal to the fair market value of the shares on the date the option is granted, and are in no event to terminate more than ten years from the date of grant. The first group of options was granted on January 3, 1961 and consisted of approximately 6,000 shares.

MINUTES OF PROCEEDINGS

FRIDAY, May 26, 1961.
(22)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Mssrs. Campbell (*Lambton-Kent*), Clancy, Clermont, Doucett, Fane, Forbes, Gundlock, Henderson, Horner (*Acadia*), Knowles, Korchinski, McBain, Mandziuk, Milligan, Montgomery, Muir (*Lisgar*), Noble, Peters, Rapp, Regnier, Ricard, Rompre, Slogan, Southam, Stefanson, Thomas, Tucker, and Villeneuve. (28)

In attendance, from the Saskatchewan Wheat Pool: Mr. Charles W. Gibbings, President and Mr. Robert Phillips, Research Analyst.

Agreed: That the financial statements of Massey-Ferguson Limited (*see appendix "A"*) and International Harvester Company of Canada Limited (*see appendix "B"*) for the year 1960 be made appendices to this day's Minutes of Proceedings and Evidence.

Agreed: That the Clerk of the Committee be instructed to write to Noble Cultivator Company, Nobleford, Alberta, regarding their farm machinery prices.

Agreed: That Volume 2 of the Saskatchewan Wheat Pool brief on farm machinery prices be made an appendix to this day's Minutes of Proceedings and Evidence (*see appendix "C"*).

The Chairman introduced the officials of the Saskatchewan Wheat Pool. Mr. Gibbings presented the brief on their behalf.

The Committee questioned the officials of the Saskatchewan Wheat Pool on their brief.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING (23)

The Committee reconvened at 2.45 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Clancy, Clermont, Fane, Forbes, Gundlock, Henderson Hicks, Horner (*Acadia*), Knowles, Korchinski, Lahaye, McBain, Mandziuk, Milligan, Muir (*Lisgar*), Noble, Regnier, Rompre, Slogan, Southam, Stefenson, Tardif, Thomas and Tucker. (24)

In attendance: same as at morning sitting.

The questioning of the officials of the Saskatchewan Wheat Pool was concluded.

On behalf of the Committee the Chairman thanked the officials of the Saskatchewan Wheat Pool for their appearance.

At 5.00 p.m. the Committee adjourned until Monday, May 29th at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

FRIDAY, May 27, 1961.

The CHAIRMAN: Gentlemen, we are pleased to have with us this morning the Saskatchewan wheat pool. Before I introduce the gentlemen representing the pool, there are a few matters we must take up. The first one is in reference to the financial statements of Massey-Ferguson and International Harvester. Would it be agreeable to the committee that these be made appendices to today's evidence?

Mr. HORNER (*Acadia*): You mean just the financial statements?

The CHAIRMAN: Yes, the double sheet.

Mr. FORBES: That is the balance sheet.

The CHAIRMAN: It is actually the balance sheet.

Mr. HORNER (*Acadia*): I wonder about this. In the Massey-Harris report, just preceding the consolidated balance sheet, there is a very good statement of the cost of goods and services. It is called a statement of consolidated income. I quoted from it a number of times when I was examining them.

The CHAIRMAN: That part will be included.

Mr. HORNER (*Acadia*): That is fine.

The CHAIRMAN: Is it agreed?

Agreed.

Mr. HORNER (*Acadia*): I wonder if the committee would consider this: we have been studying the cost of farm machinery and it has come to my attention that a well-known firm in Alberta, the Noble Cultivator Company Limited, at Nobleford, to the best of my knowledge has not had a price increase in their main product over the last ten years. This company employs about 70 employees, and it is in the business of selling farm machine implements. I would suggest that the clerk of the committee write to this company asking them if it is a fact that they have not had a major price increase in the last ten years, and if they employ in the neighbourhood of 70 employees? And when the clerk receives an answer from the company, if these facts are true, I suggest we hear from this company as to how they have continued to make farm machinery and to have grown in actual volume, yet have not had a price increase in the past ten years. I wonder if the committee would agree with me that we should contact this firm and ask them if this is so, and providing it is so, I wonder if the committee should not hear from them.

Mr. MUIR (*Lisgar*): Why not ask them what price increases they have had?

Mr. VILLENEUVE: I think it would be worthwhile to find out how they are operating.

Mr. HORNER (*Acadia*): This information was told to me by a person working for the Noble Enterprises at Nobleford. He was not an actual employee in the factory. This was told to me at the end of January, which was not too long ago. And the thought occurred to me that this was a company we should have here to tell us how they can continue to produce machinery and not have a major price increase for the past ten years. But perhaps rather than to request them to appear, we might contact them first to see whether or not these facts are true, and find out what machinery they are actually making. Then the committee might decide whether or not it wished to hear from them.

The CHAIRMAN: Is there any further discussion?

Mr. SLOGAN: Perhaps you might ask them, in that same letter, whether or not they would be interested in appearing before us.

The CHAIRMAN: Our only difficulty is that our days are pretty well taken up. We have two meetings already scheduled for June; and possibly to bring in a report it would take at least two meetings; and we expect to have the board of grain commissioners and the wheat board come down here for a review.

Mr. VILLENEUVE: If you found that they substantiate the statement made by Mr. Horner, that there has not been any increase, then I think very definitely this committee should take action, and that they should be given an opportunity to be heard; because, after all, whether or not they are a small operation, according to the facts that have been mentioned, this would relate to the very problem that we are investigating.

Mr. SOUTHAM: Even if we do not have time to have them come as witnesses, perhaps we could receive a brief from them which our steering committee could study and have incorporated in our evidence. They would seem to have a lot of light to throw on the subject.

The CHAIRMAN: Is it agreed that Mr. Lyons contact this company?

Agreed.

The CHAIRMAN: And then the committee could contact them further.

Mr. HORNER (*Acadia*): This town of Nobleford is in one of the best provinces in Canada.

The CHAIRMAN: I do not know if you could get all the committee to agree on that one.

Mr. SOUTHAM: I thought Mr. Horner was referring to something which was started by the Saskatchewan government.

The CHAIRMAN: Today we have another lengthy brief. Might I suggest that we take the tables and farmers' views as inserted in volume 1 of the brief as read, and have the reporters place them in their proper places? Then our witness could read the main text. May I also suggest that volume 2 of the brief be made an appendix to today's minutes of proceedings and evidence. Is it agreed?

Agreed.

The CHAIRMAN: We are very pleased to have with us Mr. Charles W. Gibbings, president of the Saskatchewan wheat pool, and Mr. Robert Phillips, research analyst for the Saskatchewan wheat pool. I now call on Mr. Gibbings to present his brief.

Mr. CHARLES W. GIBBINGS (*President, Saskatchewan Wheat Pool*): This submission by Saskatchewan wheat pool is based primarily on the replies from 887 farmers to a mailed questionnaire seeking information about their acquisition, maintenance and use of farm implements and machinery. More than 80 per cent of the farmers who were asked to complete the questionnaire responded by mail within a month. This unusually heavy response indicates the farmer's wide interest in and concern about the state of the farm machinery situation.

The questionnaire also asked: "What suggestions can you make to improve the farm machinery situation either for new machinery sales and distribution or availability of parts and repairs?" and "Do you have any comment to make on price of new equipment or repair parts?". Farmers who replied provide some useful views, many of which will be considered in the body of this submission.

In making this submission to the standing committee of the House of Commons on agriculture and colonization, Saskatchewan wheat pool represents not only its 77,500 member patrons¹ but also the entire Saskatchewan farming

community now estimated to number about 97,000 farmers. The wheat pool is the largest farmer-owned producer organization in the province and has traditionally maintained policy positions for the improvement of the industry as a whole and for the betterment of farming and living conditions for all farmers.

Saskatchewan wheat pool's share of the total crop and livestock market in the province remains significant. In the crop year, ended July 31, 1960, the country elevator division handled 50.50 per cent of all grain marketed in the province and 51.67 per cent of the wheat crop. Saskatchewan farmers in total produced 56.10 per cent of all wheat grown in Canada and 37.92 per cent of total grain production. The livestock division handled (through the four public stock yards it owns and the three others in which it operates facilities) 50.15 per cent of all cattle and calves sold in public, 27.99 per cent of the hogs and 39.15 per cent of sheep and lambs. In recent years Saskatchewan farmers have together accounted for about 20 per cent of all cattle marketed in Canada, for about 10 to 14 per cent of all calves and for about 10 per cent of all hogs. Saskatchewan's share of total sheep and lamb production is relatively less significant.

Saskatchewan wheat pool also operates a flour mill and an oil seed extraction plant in Saskatoon and maintains a printing division which engages in commercial printing and publishes the weekly *Western Producer* which has a circulation throughout Canada.

Price concerns farmers

Saskatchewan wheat pool submits at the outset that your terms of reference, which were to "enquire into the prices of farm machinery and to report to the house thereon," in truth touch upon the major concern of farmers. At least 758 of the 887 sample farmers who replied to the questionnaire consider the price of farm machinery and its repair parts too high. This concern was registered about equally in all of the 16 wheat pool districts and by farmers on both smaller and larger farms alike.

However, Saskatchewan wheat pool holds that simply to enquire into prices of machinery would not be enough. The survey suggests and our wide experience confirms that many other factors affect farmers' ability to acquire and maintain adequate farm machinery and it is the total picture—price as well as these other factors—which concerns Saskatchewan wheat pool as a spokesman for organized farmers in Canada's principal grain province.

In 1953, a provincial royal commission in Saskatchewan studied farm mechanization during its investigation of agriculture and rural life. Its report on mechanization and farm costs², one of 15 individual reports published after its three-year study, considered various enquiries of the past into the farm machinery situation and of these said this:

Every one of these enquiries placed major emphasis on the manufacturing industry and its distributive system. Relatively little attention was paid to bringing about a better understanding of the effect of mechanization on the agricultural industry itself. In the opinion of this Commission an investigation of the state of mechanization in the agricultural industry is more important at this time than a restudy of the price aspect. While it may be shown that inequities exist in the prices which farmers must pay for machinery, we cannot be blind to the deficiencies of agriculture itself.

¹ Saskatchewan wheat pool records show that in the crop-year 1958-59 a total of 76,977 individual farmers delivered some of their grain and livestock for marketing to wheat pool facilities and received excess charges refunds, and that in 1959-60 a total of 77,500 individual farmers were listed as member patrons eligible to receive refunds.

² Report of the Saskatchewan royal commission on agriculture and rural life, volume 2, *Mechanization and Farm Costs*, (Queen's Printer, Regina), 1955, page 3.

Other Factors Important

In this submission Saskatchewan wheat pool will have considerable to say about price and the discernible factors which contribute to its increase. But this submission is also concerned in a major way with the larger aspect of farm mechanization and will present details to indicate the extent of mechanization today among the sample group of 887 farmers, and will consider how they acquire machinery, how they keep it in repair and how they use it.

Lest there be any misunderstanding between those who present this submission and those to whom it is presented, Saskatchewan wheat pool states without equivocation that it believes that current prices for farm machines and implements and for their repair parts are too high. One of the sample farmers supplied the following from his own experience to indicate what he thinks of the situation.

The farmer operates seven quarter sections in wheat pool district 14, which is in the northeastern part of the province. This view merits recording here as a sample of Saskatchewan farmer opinion. He said:

It seems superfluous for me to say that machine prices are absolutely out of line with prices received for farm goods. For instance, in 1947 I paid the equivalent of 1,800 bushels of No. 2 wheat for a 12-foot combine. In 1952 I paid the equivalent of 3,800 bushels of No. 2 wheat for a 12-foot combine and in 1960 the same 12-foot combine would have cost me 6,400 bushels of No. 2 wheat.

An examination of the indices used by the bureau of statistics to compare the prices of commodities and services used by farmers shows that in the last 10-year period the index for farm machinery prices has increased by more than 50 per cent—a greater increase than for the index for any of 12 other commodities and services considered in the D.B.S. report³.

TABLE I

INDICES FOR PRICES OF COMMODITIES AND SERVICES USED BY FARMERS⁴ 1950 AND 1960 COMPARED
(BASE 1935-39 = 100)

Commodity or Service	August 1950	August 1960	Percentage increase or (decrease)
Composite index including living costs (estimated)	203.3	256.3	26.1
Equipment and materials	192.5	228.2	18.5
Taxes and interest rate	155.4	207.5	33.5

Seed	233.5	198.8	(14.9)
Hardware	172.5	251.7	45.9

³ D.B.S. Price index number of commodities and services used by farmers (catalogue 62-004), August 1950 and 1960.

⁴ The Canadian federation of agriculture submission devoted more detail to considerations of farm machinery price increases and we commend study of that submission to members of this committee.

This comparatively high increase for the price index of farm machinery was during a decade when post-war farm mechanization was rapid. In the same 10-year period the index for the prices of farm products actually declined from 251.5 in 1950 to 200.8 for 1960, about 20 per cent⁵. This is the reason why farmers complain volubly about farm machinery and repair part prices and why they welcome this present investigation of farm machinery prices by this parliamentary committee.

However, price aside, there are other problems which contribute in one way and another to the increased burden to the farmers of machinery costs. This submission will concentrate on these other factors. This is not to say that prices are not a major concern. They most certainly are *the* major concern. The other factors, however, may not be fully recognized by people not directly engaged in farming on the prairies and the farmers who collectively and co-operatively own and operate Saskatchewan wheat pool believe themselves adequately qualified to introduce data and opinions about these other factors.

Saskatchewan wheat pool would wish to remind members of this committee that our farm organization was a founding member of the Canadian federation of agriculture and has been and still is an active supporting member of the C.F.A. and its policies. Spokesmen for C.F.A. have already appeared during this investigation to present views and recommendations for your consideration. While the C.F.A. submission deals with the question before you in a different way from the approach of this submission, our officials and directors would remind you that it also speaks for the Saskatchewan farmer and that Saskatchewan wheat pool supports the C.F.A. presentation.

CHAPTER 1: THE CHANGING SCENE

While the Canadian population has increased by about 50 per cent in the last generation, the population of Saskatchewan has increased only slightly. There now are fewer people on Saskatchewan farms than there were in 1941, the farms are larger and there are, of course, fewer farms. The scene on the farm itself has changed greatly: the internal combustion engine has provided power to replace the horse, farm implements themselves have changed in a way to give the farmer more effective cultivating and harvesting machines, new crops have been introduced and more farmers have entered livestock production.

These changes have occurred for many reasons not least of which has been the marked improvement in the availability and quality of farm machinery and implements. Improved machinery has allowed one man to operate a larger farm and to engage in a wider variety of farm production. The shortage of farm labor has contributed to the need for increased productivity per farmer. The continuing quest for higher cash income per farm has also encouraged the farmer into more diversified production and the existence of improved machinery has helped to make this diversification possible.

Disturbing paradox

Your committee has already heard much about the influence of improved farm machinery and equipment on increased farmer productivity. However, the farmer believes that he personally benefits less from this improved productivity than does the economy as a whole. It is a disturbing paradox. On the one hand the farmer acquires more and improved machinery to reduce his unit production costs in an attempt to show an increased net return after his produce has been marketed. But on the other hand, the capital expenditures for

⁵ D.B.S. *Index numbers of farm price of agricultural products* (catalogue 62-003) January 1961. (The base period 1935-39 equals 100).

¹ Canada census report and D.B.S. reports of grain production. Estimates of population and number of farms from government of Saskatchewan department of agriculture reports.

² Farmers answering the wheat pool's mailed questionnaire indicated increased ownership of these four kinds of machines. The ratio between the group and the number of farmers reporting automobiles is 1 to .38, for trucks 1 to .95, for tractors 1 to 1.28 and for grain combines 1 to .92.

³ More than 80 per cent of the sample farmers say they operate mixed farms, indicating an increase in the incidence of livestock on Saskatchewan farms since 1956. No official sources have estimated the number of farms reporting these kinds of livestock since the 1956 intra-census report.

improved machinery and equipment so inflate the farmer's total production costs that the increased productivity often accomplishes little more than to forestall a real reduction in his net return in the face of falling farm prices. Without the improved machinery he might be forced out of business but to pay for it he often comes mighty close to being forced out of business.

These claims of relative impoverishment are made by members of the Prairie farm community to explain in part their real concern over the rising cost of improved farm equipment and machinery and of their repair parts. Some of the factors involved in these claims will be considered in the body of this submission.

Biggest Farm Machine Market

Because of the importance of grain production to the Saskatchewan economy, the province provides the biggest Canadian market for farm implements and machinery and also machinery repair parts. There are a number of indices to demonstrate the importance of the machinery industry to Saskatchewan and of Saskatchewan to the machinery industry.

In the matter of grain production, Saskatchewan fields produce on an average about 40 per cent of all grains produced in Canada annually. They produced nearly 60 per cent of all wheat grown in Canada.

Agriculture remains the principal source of income to the province in terms of the net value of commodity production although its relative position among total commodity production is declining as other industries increase in importance.

Grain brings most farm cash income

Grain production in Saskatchewan accounts not only for the biggest slice of the province's farm cash income from all sources but cash income from grain production in Saskatchewan also accounts for more than one-third of total cash income from grain for all of Canada. Both of these demonstrate the importance of farm machinery to the Saskatchewan farm.

TABLE IV
TOTAL FARM CASH INCOME (IN MILLIONS OF DOLLARS) AND CASH INCOME FROM CROPS ONLY COMPARED FOR CANADA AND SASKATCHEWAN 1954-59.⁵

This suggests the important potential market in Saskatchewan for farm machines. Figures recording the actual sales of both new machines and repair parts in the last 10 years demonstrate that on the average Saskatchewan farmers purchased something like 25 per cent of all Canadian farm machines and implements marketed and something approaching 30 per cent of all repair parts marketed.

CHAPTER 2: SASKATCHEWAN FARMERS, FARMS AND MACHINERY

Saskatchewan wheat pool's survey sampled opinion on a variety of questions relating to the acquisition, the maintenance and the use of farm machinery, particularly in the years 1958-60. This document does not claim that the sample of 887 farmers who replied to the questionnaire represents the total of all Saskatchewan farmers but it does claim that their views, however unrepresentative, serve a useful purpose in the deliberations of this standing committee on agriculture and colonization.

How different the 887 farmers actually are to the total of all farmers is, at the moment, a matter of opinion. Many of the factors demonstrated by the survey may be compared in time to the returns available after the 1961 census report is completed. Until that yard stick is available many of the conclusions about Saskatchewan farmers demonstrated by the survey must be assumed to be useful and accurate. All factors were compared in the survey to a smaller more-random selection and for no single factor did the comparisons suggest the sample of 887 unsuited to the purpose of this submission.¹

¹ Detailed analysis of the questionnaire's 32 questions together with comparisons of replies from the 887-member sample with replies from a 41-member random selection are contained in the report of the survey, a copy of which is attached as volume II of this submission. The term "random selection" used occasionally in this volume, refers to the 41-member group used for comparison.

Saskatchewan wheat pool claims in this submission that many of the views contained in this document are in fact representative of the views of all farmers even though in time the nature of the sample itself may be shown to be in some respects unrepresentative. These views will be considered in detail in this document and conclusions arising therefrom will be presented as recommendations to this committee in its enquiry "into the prices of farm machinery."² In fact, it may be concluded that should the sample of 887 be determined to be "unusual" farmers in the sense that they operate bigger-than-average farms or are better mechanized than the average for the province as a whole, that their considered views on the subject now under investigation are really of more use to this committee than would be a compilation of the concensus of total views.

Farm Size Increasing

Farmers in the sample group of 887 appear to operate larger farms on the average than did all farmers in the province at the time of the 1956 inter-census estimate.³ The census showed that the average farm size in 1956 was 607 acres or about 3.8 quarter sections. Calculations from the 1960 survey show that the sample group has an average farm size of about 5.25 quarters or 840 acres. How much actual increase there has been in average farm size cannot be concluded from these figures but they do indicate and experience confirms that there has been a major increase in the last five years.

TABLE VI

FARM SIZE DISTRIBUTION IN 1956 COMPARED WITH FARM SIZE DISTRIBUTION FOR THE 1960 SAMPLE
(one quarter section = 160 acres)

1956 Inter-census report		1960 survey	
Size in acres	Percentage of total farms	Sample size in quarters	Percentage of total farmers
1- 479 acres.....	43.7	1-3	28.6
480- 639 acres.....	18.2	4	21.6
640- 959 acres.....	21.3	5-6	23.8
960-1,279 acres.....	7.8	7-8	13.5
Over 1,280 acres.....	6.7	Over 8	14.3
Farms: 103,391.....	100.0	Sample: 887	100.0

Fewer of the farms in the sample of 887 are reported at four quarters or less than were total farms in 1956. The sample group also reports more farms over eight quarters in size than were reported in 1956.

Mixed farming widespread

Just over 80 per cent of the sample farmers operate mixed farms, 19 per cent operate grain-only farms and fewer than one per cent have livestock-only operations.⁴ It has been assumed, with some justification, that the factor which makes most farms "mixed" is diversification into livestock production by farmers who are also grain farmers.⁵ The number of cattle other than milch

² From the terms of reference establishing this investigation.

³ See survey report, question 2.

⁴ See survey report, question 3.

⁵ Statistics in the annual report of the Saskatchewan department of agriculture, March 1961, show changes in the numbers of livestock on Saskatchewan farms at June 1, each year, on the following basis: (see table on top of page 842.)

Year	Horses	Milch cows	Other cattle	Total cattle	Sheep and lambs	Hogs
1931.....	997,400	424,000	764,900	1,188,900	281,000	949,000
1941.....	800,700	437,700	803,500	1,241,200	330,000	943,700
1951.....	303,900	316,200	958,600	1,274,800	136,100	533,300
1956.....	170,800	272,200	1,596,800	1,869,000	142,700	591,900
1957.....	160,000	261,000	1,659,000	1,920,000	154,000	633,000
1958.....	148,000	254,000	1,606,000	1,860,000	175,000	890,000
1959.....	132,000	248,000	1,602,000	1,850,000	187,000	845,000
1960.....	120,000	245,000	1,685,000	1,933,000	217,000	585,000

cows on Saskatchewan farms at June 1 each year has nearly doubled in the last decade. Sheep and lambs are up considerably in recent years and the hog population, which declined for some years after the war, has increased. Live-stock marketing from Saskatchewan farms has also increased considerably. In the last five-year period alone⁶ the number of cattle marketed by Saskatchewan farmers through public stock yards or by shipping direct from country points has increased from 393,467 animals in 1955 (19.23 per cent of the Canada total) to 441,754 animals in 1959 (20.23 per cent of the Canada total). Marketing of calves in the same period has risen from 86,003 in 1955 (9.33 per cent of the total) to 127,087 in 1959 (14.23 per cent of the total) and of hogs from 562,359 in 1955 (9.50 per cent of the total) to 908,343 in 1959 (10.6 per cent of the total).

Moves to extend land holdings

Forty per cent of the sample farmers are still making payments on land purchases with the greatest number of these on the larger-sized farms.⁷ Fifty per cent of the farmers operate their farms on an owner-renter basis with the greatest number of these on the larger farms.⁸ This indicates that farmers are moving by both purchase and renting to extend their land holdings.

The owner-renter tenancy factor has increased greatly since the 1956 inter-census report when only 40 per cent of the farmers operated on this basis. At the same time the percentage of farmers who entirely own their land has dropped from 52.4 in 1956 to 40.1 in 1960 and the percentage of those entirely renting has about halved from 13.2 in 1956 to 6.7 in 1960. It is the smaller farmers who represent the highest percentage of farmers who both own all their land or rent all of it.

TABLE VIII
COMPARISON OF LAND TENANCY 1956 CENSUS AND 1960 SURVEY

Tenancy	1956 Inter-census		1960 Survey (Sample)		1960 Survey (Random)	
	No.	% of total	No.	% of total	No.	% of total
Owned.....	54,218	52.5	352	40.1	22	53.7
Rented.....	13,476	13.0	59	6.7	5	12.2
Owned-rented.....	35,034	33.9	467	53.2	14	34.1
Manager.....	663	0.6	Nil	—	Nil	—
Total farms.....	103,391	100.0	878	100.0	41	100.0

The sample farmers appear to show a greater increase in owner-renter tenancy than do farmers reporting in the random selection. However, it is the judgment of those closely related to farming in Saskatchewan that there has been a more marked change in tenancy than the random selection results would demonstrate and that the sample results demonstrate more accurately what has actually occurred in the last five years.

The sample farmers report larger farms than the average for the province in the 1956 inter-census report. This indicates sample farmers are extending their holdings further both by purchasing and renting additional land, and are diversifying their operations, particularly by extending their livestock production. The 887 farmers who made these points are on the whole a young group of men, they are well-educated, experienced at farming and actively interested in the communities in which they live. Most of them live on their land all year round and few of them or their wives have off-farm jobs. Most of them also operate without outside hired help.⁹

Saskatchewan wheat pool believes that the move to fewer and larger farms is going to continue although the rate of change may be expected to slow down unless there is some revolutionary technological development. Farmers individually and agriculture as an industry are also going to continue to seek out additional diversifications both to cushion the risks and to help individual farmers to improve their cash incomes. Both of these—the changes in farm size and extension of diversification—have a real effect on the demand

⁷ See survey report, question 5.

⁸ See survey report, question 4.

⁹ See survey report, questions 6, 7, 8, 9, 10, 11 and 12.

for farm implements and machinery. Farm size affects the farmer's demand for size and numbers of implements. Diversification, particularly expansion of livestock production, increases greatly the need for hay rakes and mowers, hammer mills and grinders, forage harvesters and the like, all implements used in preparation of feed for livestock.

Government policies must continue to recognize these developments and adjustments and must continue to help farmers rather than hinder them. Farm machinery companies must also continue to recognize these developments and be ready to supply improved machinery under arrangements the changing conditions can meet.

Tractors vs the horse

The tractor is the symbol of the co-called mechanical revolution which has swept the wheat-growing area of the prairies in the last generation. In 1921 there were more than one million horses on Saskatchewan farms and more than 90 per cent of the 119,451 farms had horses. Although the use of motorized machinery had not become prevalent by 1921, there were many farms which had tractors and had them at that date for some time. In 1921 the census recorded 19,243 tractors in use on Saskatchewan farms with 14.67 per cent of all farms reporting a tractor. By the following census the incidence of tractors had doubled and the incidence of truck and grain combines had become sufficiently wide-spread to merit separate reports for each. It is in the years since that the great increase in their use and the decline in the importance of the horse has developed.

TABLE IX
NUMBER OF TRACTORS 1921-60 COMPARED TO NUMBER OF HORSES

	1921	1931	1941	1956	1956	1960 estimates
Number of farms.....	119,451	136,472	138,713	112,018	103,391	97,000
Number of horses.....	1,077,882	997,426	800,693	303,853	170,769	132,000
% of farms reporting horses	90.4	81.6	77.5	70.8	55.5	na
Number of tractors.....	19,243	43,308	54,129	106,664	121,388	128,974
% of farms reporting tractors.....	14.7	28.9	37.0	80.6	88.8	na ¹⁰

Although there are still a great many horses on Saskatchewan farms there are no figures to indicate how many farmers actually account for these horses in total. Many farmers keep horses purely out of sentiment and for pleasure but few use horses for actual farm work. There is a clearer indication of the incidence of tractors, at least among the sample farmers.¹¹

The questionnaire shows the following on tractor incidence:

- 484 farmers (58.38 per cent of the 829 farmers replying) own one tractor new when purchased;
- 77 farmers (9.29 per cent of the total) own two tractors new when purchased;
- 11 farmers (1.33 per cent of the total) own three or more tractors new when purchased;

¹⁰ The survey report demonstrates that on an average there are 1.28 farmers with tractors for each farmer reporting. See question 24.

¹¹ Although the sample numbered 887 only replies from 829 farmers, the ones who identified in which wheat pool district their farm is located were considered for the machinery inventory question.

- 369 farmers (44.51 per cent of the total) own one tractor second-hand when purchased;
 109 farmers (13.15 per cent of the total) own tractors second-hand when purchased; and
 17 farmers (2.05 per cent of the total) own three or more tractors second-hand when purchased.

These figures establish that 572 farmers own at least 671 tractors which were new when purchased and that 495 farmers own at least 638 tractors which were second-hand when purchased and that 1,067 farmers own a total of 1,109 tractors. This does not prove that each sample farmer does in fact own at least one tractor but experience indicates most farmers do. It does show, however, that the total group of 829 sample farmers bears the relationship of 1 to 1.28 with the group of 1,067 farmer reports of tractor ownership.

Comparable calculations for the ownership among the 829 sample farmers of the other 20 kinds of machines and implements included in the machinery inventory indicate that fewer than the 829 farmers report ownership of any of the other implements. The following table demonstrates this to be so.

TABLE X

NUMBER OF SAMPLE FARMERS REPORTING OWNERSHIP OF VARIOUS MACHINES TOGETHER WITH THE RATIO OF FARMER REPORTS FOR EACH MACHINE TO TOTAL NUMBER OF FARMERS

Implement or Machine	Report new machines				Report second-hand machines				All farmers reporting		Ratio
	Total farmers	One mach.	Two mach.	3 or more mach.	Total farmers	One mach.	Two mach.	3 or more mach.	Total farmers	reporting

New vs second-hand machines

Farmers were asked to report how many of each kind of machine they have new or second-hand. More farmers report second-hand trucks, one-ways, seed drills, binders, threshers and hay rakes than new ones. Binders and threshers may have been acquired mainly as stand-by implements and farmers may consider second-hand ones sufficient. But the propensity for farmers to buy second-hand trucks, one-ways, seed drills and hay rakes, however is another matter. These four are relatively important implements and farmers are less able to get along without them. The fact more have second-hand than

new ones may indicate, as we suspect it does, that farmers actually need more of these machines than they can afford to buy new.

Detailed analysis of the inventory report indicates the following about tractors, trucks and grain combines, three of the principal machines.¹²

Tractors: More sample farmers report new tractors than second-hand tractors, with the larger farmers favoring new over second-hand tractors more than do smaller farmers. Larger farmers also report more tractors in total. This suggests that ability to purchase is a principal factor in the purchase of new tractors over second-hand tractors.

Trucks: More sample farmers own second-hand trucks than own new trucks. Only larger farmers have more new trucks than second-hand trucks. There is no clear indication for trucks as there was for tractors that ability to buy new trucks influences greatly the farmer's choice between a new truck and a second-hand truck.

Grain Combines: In total more sample farmers purchase new grain combines than second-hand ones. Fewer farmers own more than one combine than own more than one new tractor or truck. None of the group reports three or more new combines while some at least report three new tractors or trucks. The larger the farmer the more likelihood there is for him to have at least one new combine. This is clearly an indication that ability to pay influences a farmer's choice between a new or a second-hand combine.

In general, factors other than economics appear to influence the farmer's purchase of trucks and to a less extent tractors and grain combines.

Better second-hand machines

The apparent inability of smaller farmers to buy new equipment and their apparent dependence on second-hand equipment suggests that more attention should be given to improve the condition of second-hand machines. Saskatchewan wheat pool is aware that nearly every machinery dealer is equipped to resell used machinery he takes on trade for new models. Farmers replying to the survey indicate, however, that many of these dealers are not able or equipped to overhaul and repair the used machinery they offer for resale. The fact that the automobile industry has second-hand dealers able and willing to modernize and repair motor trucks offered for second-hand resale might have something to do with the fact that more farmers in the sample buy their trucks second-hand than buy new trucks. Availability of other machines and implements on an organized second-hand market might be one way industry could help the farmer meet his increasing demand for additional equipment.

One-third of inventory between \$10,000 and \$20,000

Thirty-seven per cent of the farmers report their machinery inventory valued at current prices between \$10,000 and \$20,000.¹³ About 50 per cent have machinery valued at less than \$10,000 and 11 per cent at more than \$20,000.

TABLE XI
PERCENTAGE OF 886 FARMERS WITH CURRENT VALUE OF FARM MACHINERY

Total replies		Under \$5,000	\$5,-\$10,000	\$10,-\$20,000	\$20,-\$30,000	Over \$30,000
886	100%	18.5	32.9	37.4	9.1	2.1

¹² See survey report, question 24, tables 24C for various machines.

¹³ See survey report, question 14.

The larger farmers generally have the highest valued machinery but a substantial percentage of larger farmers report machinery valued at less than \$10,000 and at least some of the smaller farmers report machinery valued at more than \$20,000. This suggests that some farmers have too much machinery and some too little.

The Saskatchewan Department of Agriculture has been operating farm management clubs throughout the province for the last two years. In 1958 there were 290 members of 22 clubs and in 1959 there were 455 members of 42 clubs. The 290 farmers in 1958 reported average investment in machinery and equipment of \$9,237 which was estimated at 17 per cent of their total farm investment. The 455 farmers in 1959 reported average investment in machinery and equipment of \$9,782 which was estimated again at 17 per cent of their total farm investment.

Comparing the results of the 1960 survey with results from the last two years of management club operations suggests that the sample farmers tend to have a larger investment in machinery and equipment. This assumes, of course, that the sample farmer's determination of "current value of farm machinery owned" is comparable to the management club member's determination of machinery investment.

Mixed farmers carry higher inventory

More grain farmers than mixed farmers in the sample record machinery valued at under \$5,000. More mixed than grain farmers report machinery valued between \$5,000 and \$30,000. Of the few with more than \$30,000 in machinery inventory, most are grain farmers. On the whole the mixed farmers seem to have a higher machinery inventory than the purely grain farmers. We suggest this is because their increased diversity demands more machinery.

TABLE XII

RELATIONSHIP OF MACHINERY INVENTORY VALUE TO TYPE OF FARMING

Number of farmers		Under \$5,000	\$5,-\$10,000	\$10,-\$20,000	\$20,-\$30,000	Over \$30,000
Grain.....	169	21.89%	30.18%	34.91%	8.88%	4.14%
Livestock..	1	—	100.00	—	—	—
Mixed.....	696	17.96	33.48	37.93	9.05	1.58

Renters Carry Smaller Inventory

More sample farmers who own all of their land or who rent all of their land report inventories valued under \$10,000 than do farmers who operate farms with part of their land owned and part rented. More of the owner-renters have higher valued inventories than have farmers who own all their land. Farmers who rent all of their land trail behind both groups in recording the higher valued inventories. Farmers who operate on an owner-renter basis appear to have a bigger or better line of equipment. They have, of course, the bigger farms.

TABLE XIII

RELATIONSHIP OF MACHINERY INVENTORY VALUE TO LAND TENANCY

Number of farmers	Under \$5,000	\$5,-\$10,000	\$10,-\$20,000	\$20,-\$30,000	Over \$30,000
All owned.....	340 18.53%	37.35%	32.35%	9.71%	2.06%
All rented.....	57 28.07	35.09	31.58	5.26	—
Owned-rented.....	466 17.17	29.83	41.20	9.23	2.57

Two-thirds of the farmer sample consider their present inventory of machinery suitable¹⁴. Nearly 60 per cent have enough machinery, 40 per cent have too little and fewer than one per cent have too much. There was little difference in these attitudes between smaller and bigger farmers.

Grain Farmers Better Satisfied

More grain farmers than mixed farmers have enough machinery and more of the mixed farmers have too little. The greater dissatisfaction among the mixed farmers is partly because they require additional machinery to harvest and prepare crops for livestock feed.

TABLE XIV

ATTITUDE OF GRAIN, LIVESTOCK AND MIXED FARMERS ABOUT SUFFICIENCY OF EQUIPMENT

Number of farmers	Enough machinery	Too little machinery	Too much machinery
Grain.....	166 72.29%	26.51%	1.20%
Livestock.....	0 —	—	—
Mixed.....	709 56.28	43.58	0.14

Sample farmers who rent all of their land appear the least satisfied with their present machinery inventory. Those who own all their land are the most satisfied. The rent-paying factor by itself appears to have a considerable influence on ability to acquire sufficient machinery.

TABLE XV

ATTITUDE OF FARMERS WHO OWN, RENT OR OPERATE OWNER-RENTER FARMS ABOUT SUFFICIENCY OF EQUIPMENT

Number of farmers	Enough equipment	Too little equipment	Too much equipment
Owned.....	338 61.84%	37.26%	0.90%
Rented.....	52 46.15	53.85	—
Owner-renter...	477 58.70	40.88	0.42

¹⁴ See survey report, question 15.

Conclusions: Considerations in this chapter demonstrate that other factors as well as price affect the farmer's attitude toward and ability to purchase farm machinery. Farm size is an important other factor, the extent of diversification of the farming operation is another factor. Whether a farmer is in the process of extending his land size by purchase or renting additional land also affects his apparent ability to purchase farm machinery.

Chapter 3: Machinery Purchases 1958-60

Farmers responded generously to a variety of questions about how they buy machinery and in particular how much money they have spent on new and second-hand machinery in the last three years.

On an average three-quarters of the sample group ordinarily buy some new and some second-hand machinery, about 18 per cent of them buy all of their machinery new and seven per cent buy no new machinery¹.

The smaller the farmer the more second-hand machinery he purchases or alternatively the less his ability to buy any new machinery. A good fifth of the farmers on one and two quarters do not buy any new machinery.

More grain farmers than mixed farmers buy all their machinery new although the grain farmers do not, on the average, have or require as much machinery as do the mixed farmers.

TABLE XVI

RELATIONSHIP OF FARMING TYPE TO NEW AND SECOND-HAND MACHINERY PURCHASES

Number of farmers		All new	Some new	None new
Grain.....	166	26.51%	67.47%	6.02%
Livestock.....	1	—	100.00	—
Mixed.....	711	15.61	77.07	7.32

Farmers who rent all of their land or operate on an owner-renter basis buy more second-hand machinery than do farmers who own all of their land. The fact that each pays rent may be the factor reducing ability to buy new machinery.

TABLE XVII

RELATIONSHIP OF FARM TENANCY TO NEW AND SECOND-HAND MACHINERY PURCHASES

Number of farmers	All new machinery	Some new machinery	No new machinery
Owned..... 334	25.15%	68.26%	6.59%
Rented..... 61	6.56	80.33	13.11
Owner-renter... 471	13.80	80.47	5.73

Machinery Purchases on the Increase

While fewer than one-fifth of the sample farmers generally buy only new machines, in the last three-year period 70 per cent of the 887 farmers bought some new machinery and 63 per cent bought some second-hand machinery².

¹ See survey report, question 18.

² See survey report, questions 19 and 20.

The percentage of sample farmers who bought either new or second-hand machinery in the last three years increased for each of the three years with the increase greater for second-hand purchases.

TABLE XVIII
NEW AND SECOND-HAND MACHINERY PURCHASES COMPARED, 1958-60

Total number of farmers	Bought new machinery		Bought second-hand machinery		
	No. of farmers	% of total	No. of farmers	% of total	
1958.....	887	371	41.83	272	30.67
1959.....	887	406	45.77	305	34.39
1960.....	887	462	52.09	406	45.77

Quarter of Farmers Pay Cash

More than a quarter of the sample farmers buy all their machinery for cash³. Of those who need credit, half use Farm Improvement loans⁴. They acquire credit on the following basis: 15.95 per cent use the credit union, 60.74 per cent use the banks, 6.4 per cent use finance companies, 1.65 per cent use family sources and 5.21 per cent use "other" credit sources.

Smaller and larger farmers are represented about equally among those who pay cash and there is little difference on the basis of farm size in the choice of credit facilities. The smallest farmers use banks more than any other credit source and none of the one-quarter section farmers use finance companies. Smaller and bigger farmers use Farm Improvement loans about equally. The fact that there is no discernible difference between the use of Farm Improvement loans by smaller and larger farmers suggests that lending institutions may not provide for the "ordinary" farmer, the advantage in acquiring government-guaranteed loans which was apparently intended when the Farm Improvement Loan Act was enacted in 1944.

More Buy New Than Second-hand

In the 1958-60 period 628 farmers bought some new machinery and 560 bought some second-hand machinery⁵. For each year considered individually, the numbers increased for each category of purchase with the greatest increase occurring in the numbers purchasing second-hand machinery.

³ See survey report, question 21.

⁴ See survey report, question 22.

⁵ See survey report, questions 19 and 20.

TABLE XIX

DOLLAR VALUE OF MACHINERY PURCHASES COMPARED 1958-60

<i>New Machinery purchases 1958-60</i>				
Percentage of total farmers who bought new machines				
Total replies	Under \$500	\$500-\$2,000	\$2,000-\$5,000	Over \$5,000
887.....1958	9.36	18.38	8.34	5.75
887.....1959	10.48	18.60	8.23	8.46
887.....1960	8.46	24.35	8.12	11.16
<i>Second-hand Machinery purchases 1958-60</i>				
Percentage of total farmers who bought second-hand machines				
Total replies	Under \$500	\$500-\$2,000	\$2,000-\$5,000	Over \$5,000
887.....1958	14.09	12.97	3.38	.23
887.....1959	16.12	14.09	3.72	.45
887.....1960	19.39	19.50	5.64	1.24

The bigger farmers appear more able to increase new machinery purchases between 1958 and 1960. The bigger farmers bought less new machinery at the lower dollar value and more at the higher value.

Smaller Farmers Increase Second-hand Purchases

The smaller sample farmers bought more second-hand machinery in 1960 than they did in the earlier two years. The bigger farmers also bought more second-hand machinery but the percentage increase in their purchase is lower than for the smaller farmers.

In each of the four purchase value groupings there was a steady increase from 1958 to 1959 to 1960 in the number of farmers purchasing second-hand machinery which was not so for the new purchases. Slightly fewer sample farmers bought new machinery valued between \$2,000 and \$5,000 in 1960 than in 1958. This may be because of the increase in prices of new machinery. Another factor may also be the declining ability of farmers as a whole to make new machinery purchases regardless of the price increase for any particular machine or implement.

Conclusions: Three-quarters of the sample farmers normally buy more of their machinery second-hand. Grain farmers tend to buy more new machinery than do the mixed farmers and farmers paying some rent for their land buy less new and more second-hand machinery than do farmers who own all of their land. During the 1958-60 period 70 per cent of the sample bought some new machinery and 63 per cent bought some second-hand machinery with purchases for both new and second-hand machinery increasing in each of the three years. More of the bigger farmers bought new machinery and increased their purchases each year by more than did smaller farmers, relating farm size directly to new machinery purchases. One quarter of the sample farmers buy machinery for cash and of those who need credit half get Farm Improvement loans. Banks supply credit for 60 per cent of the farmers.

Chapter 4: Custom Hiring and Sharing

Custom Work on the Decline

About half of the sample group engage in custom hiring¹. A field survey for the Saskatchewan Royal Commission on Agriculture and Rural Life in 1953 showed that about 60 per cent engaged then in custom hiring. There is a strong indication there has been a real change in custom hiring in the intervening years. Only 42 per cent of the random selection of farmers engage in custom work.

TABLE XX
CUSTOM HIRING 1953 AND 1960 COMPARED

	1953 Commission Study	1960 Wheat Pool questionnaire	1960 Random selection
Total farmers.....	236	828	38
Hire custom work.....	40%	16.1%	10.5%
Do custom work.....	20	17.6	10.5
Both hire and do.....	—	16.3	21.1
Neither.....	40	50.0	57.9

The 1953 study determined that about two-thirds of those engaging custom work did so for harvesting only. The 1960 study did not consider the kind of custom work.

More of the smaller farmers hire custom work than do the bigger farmers, and on the average more of the bigger farmers neither custom hire nor rent.

TABLE XXI
RELATIONSHIP OF FARMING EXPERIENCE TO CUSTOM WORK

Number of farmers		Custom for others	Hire custom work	Do both	Do neither
Under 5 yrs.....	5	20.00%	20.00%	—	60.00%
5-10 yrs.....	82	17.07	12.20	18.29%	52.44
11-20 yrs.....	315	16.83	12.38	17.14	53.65
21-30 yrs.....	253	21.34	13.83	19.37	45.46
31-40 yrs.....	101	10.89	27.72	16.38	44.56
Over 40 yrs.....	58	15.52	15.52	15.51	53.45

Farmers with few than 20 years of experience tend to rent out machinery for custom work more than they hire custom work done.

¹ See survey report, question 16.

TABLE XXII
RELATIONSHIP OF EDUCATION TO CUSTOM WORK

Number of farmers	Custom for others	Hire custom work	Do both	Do neither
Public school..... 347	19.89%	17.00%	15.85%	47.26%
High school..... 399	18.55	13.78	17.29	50.38
University..... 77	11.69	10.39	18.18	59.74

The survey results suggest statistically that improvement in education appears to decrease the farmer's tendency to engage in custom work.

TABLE XXIII
RELATIONSHIP OF AGE TO CUSTOM WORK IN 1960 (WHEAT POOL SURVEY)

Number of farmers		Custom for others	Hire custom work	Do both	Do neither
20-30 yrs.....	102	18.63%	12.75%	16.66%	51.96%
31-40 yrs.....	266	19.55	13.91	21.43	45.11
41-50 yrs.....	309	15.53	13.92	15.21	55.34
51-60 yrs.....	102	20.59	20.59	16.66	42.16
Over 60 yrs.....	46	19.57	15.22	13.04	52.17

There appears to be less direct relationship between age and custom work than was indicated in a comparable study in 1953 by the Saskatchewan Royal Commission.

TABLE XXIV
RELATIONSHIP OF AGE TO CUSTOM WORK 1953 (ROYAL COMMISSION)

Farmers by age group		Custom for others	Hire custom work	Do neither
20-40 yrs.....	98	29%	39%	32%
41-55 yrs.....	72	10	40	50
Over 56 yrs.....	66	20	44	36

The commission concluded that "younger farmers do more (custom work than older farmers and slightly more older farmers have custom work done than do younger farmers."²

Two-thirds Now Share Machinery

More than 60 per cent of the sample farmers share their machinery with others.³ More of them lend their machinery to others on a share basis than borrow machinery.

² Report of Royal Commission on Agriculture and Rural Life (Queen's Printer) Regina, 1955, Vol. 2, page 25.

³ See survey report, question 17.

The bigger farmers tend to lend machinery more than they borrow, suggesting that bigger farmers have a better line of equipment than have smaller farmers. Smaller farmers borrow machinery more than they lend, suggesting their greater need for additional machinery.

TABLE XXV

RELATIONSHIP OF FARMING EXPERIENCE TO MACHINERY SHARING

No. of farmers	Lend machinery to others	Borrow machinery of others	Do both	Do neither
Under 5 yrs..... 4	—	25.00%	50.00%	25.00%
5-10 yrs..... 79	2.53%	7.59	49.37	40.51
11-20 yrs..... 316	12.02	1.27	50.95	34.76
21-30 yrs..... 247	12.15	2.02	46.96	38.87
31-40 yrs..... 121	11.57	3.31	45.45	39.67
Over 40 yrs..... 58	17.27	1.73	22.41	58.62

More than half of the farmers with more than 40 years of experience do no machinery sharing whatever. Farmers with under five years experience do the most. Of the older farmers who do share, more lend machines than borrow. Sample farmers with under five years of experience apparently have no machinery to lend and to those who share all borrow the machines from others.

TABLE XXVI

RELATIONSHIP OF EDUCATION TO MACHINERY SHARING

No. of farmers	Lend machinery to others	Borrow machinery of others	Do both	Do neither
Public School..... 342	11.11%	2.34%	46.20%	40.35%
High School..... 400	11.25	2.75	46.50	39.50
University..... 80	13.75	1.25	51.25	33.75

The survey results suggest statistically that sample farmers with the higher education standard tend to lend machinery more than they borrow and that on the average the higher the education the more likely they are to share machinery.

TABLE XXVII

RELATIONSHIP OF AGE TO MACHINERY SHARING

No. of farmers	Lend machinery to others	Borrow machinery of others	Do both	Do neither
20-30 yrs..... 100	9.00%	4.00%	53.00%	34.00%
31-40 yrs..... 268	12.69	3.35	51.87	32.09
41-50 yrs..... 311	10.29	0.97	45.67	43.07
51-60 yrs..... 106	14.15	2.83	44.34	38.68
Over 60 yrs..... 46	13.04	2.18	26.09	58.69

On the whole the younger farmers share more machinery than the older farmers. The very young tend to borrow machinery more than they lend.

Conclusions: Farmers appear to custom hire and rent machinery less now than they did a few years ago. More than 60 per cent of them share machinery with neighbors. Smaller farmers and those with less farming experience tend to hire more machinery than they rent indicating that at least some of the farmers with increasing demand for more machinery are able to get some of it by hiring. These are the farmers who also borrow more machinery than they lend.

Chapter 5: Farm Workshops and Machinery Repairs on the Farm

About one-fifth of the sample farmers have had technical training in machine shop or motor mechanics¹ and a good number of these, and of all the farmers in the sample, have a variety of machine shop tools which enable them to carry out fairly extensive machinery repairs on the farm².

There is little difference between the percentage of large and small farmers who have taken formal training in motor mechanics or machine shop.

Bigger Farmers Have Better Workshops

However, there is a marked difference between small and big farmers who have equipped themselves with welding equipment, chain hoists and power drills. The bigger farmers have by far the best equipped workshops.

Farmers with technical machine shop or motor mechanics training have more welding equipment, chain hoists and power drills with which to equip themselves with a good farm workshop than do farmers without the training.

TABLE XXVIII

RELATIONSHIP OF TECHNICAL TRAINING TO FARM WORKSHOP EQUIPMENT³

No. of farmers	Welding equipment	Chain hoists	Power drills
Training..... 179	65.92%	39.11%	70.95%
Without training..... 661	42.51	32.53	58.09

Technical training has apparently had the greatest impact on the acquisition of welding equipment and power drills, both of which appear to require greater skill at operation than chain hoists although all three are vital to a satisfactory farm workshop.

Technical Training Influences Machinery Purchases

Technical training also appears to affect a farmer's attitude towards buying new or second-hand machinery. Those without training tend to buy more new equipment than do those with training and those with training tend to buy more second-hand than those without training.

¹ See survey report, question 30.

² See survey report, question 29.

³ These percentages do not add to 100 because all farmers do not have all three selected workshop tools.

TABLE XXIX

TECHNICAL TRAINING RELATED TO MACHINERY PURCHASES

No. of farmers	All new machinery	Some new machinery	No. new mach.
Training..... 173	12.72%	78.61%	8.67%
Without training..... 664	17.47	75.90	6.63

Technical machine shop training also appears to influence attitudes about whether machinery is adequate or not. Those with the training are less satisfied with their present machinery.

TABLE XXX

TECHNICAL TRAINING RELATED TO SUITABILITY OF MACHINES

No. of farmers	Machinery suitable	Machinery unsuitable
Training..... 170	65.29%	34.71%
Without training..... 529	79.77	20.23

Conclusions: Only about one-fifth of the sample farmers report technical machine shop and motor mechanics training but those who do have training report better-equipped farm workshops and buy more second-hand machinery. They are also less satisfied with their present equipment. It may be that they are better able to judge a good machine than farmers without such training.

Chapter 6: Record of Machinery Breakdowns in 1960

More than 60 per cent of the 887 sample farmers had a farm breakdown during 1960¹.

TABLE XXXI

THE NUMBER OF BREAKDOWNS PER SAMPLE FARMER DURING 1960

Total farmers	Farmers with breakdowns	Percentage of total farmers held up by breakdowns				
		One	Two	Three	4-10	Over 10
887	554	19.95	13.53	8.91	16.91	3.16

One-fifth of the sample had only one breakdown in 1960 and a considerable number had two or three breakdowns. Nearly one-fifth report from four to 10 breakdowns. Of the total, 28 farmers report more than 10 breakdowns each.

All farmers, regardless of farm size, appear to be equally plagued by breakdowns in 1960.

¹ See survey report, question 25.

TABLE XXXII

DURATION OF DELAYS CAUSED BY BREAKDOWNS IN 1960

Total farmers	Percentage of total farmers held up for the following periods					
	1-2 days	2-7 days	8-14 days	15-30 days	31-60 days	Over 60 dys.
887	31.34	29.20	9.02	2.25	0.23	0.23

Nearly two-thirds of all farmers were held up from one to seven days by breakdowns during 1960².

Many Drive Over 50 Miles for Parts

Farmers were asked how many miles they travelled to get repair parts³. There may have been some misunderstanding about whether the question sought round-trip figures or one-way figures. It can only be assumed that farmers replying did not give round-trip distances but even if some did the distances they report are considerable.

TABLE XXXIII

DISTANCE TRAVELLED TO GET REPAIR PARTS

Farmers replying	Percentage of 775 farmers who travelled for repair parts				
	1-10 miles	11-20 miles	21-50 miles	51-100 miles	Over 100 miles
774	16.15	25.32	29.59	13.69	15.25

Nearly 30 per cent of the 774 who reported, travel more than 50 miles for parts.

Conclusions: Farm breakdowns in 1960 plagued the small and the large farmer alike. Nearly one-third of those with breakdowns were held up one or two days and another 30 per cent from two days to one week. To get repair parts 30 per cent of them said they drive 50 miles or more. Only 16 per cent were able to get repair parts within 10 miles, a normal distance from farm to country elevator in many parts of Saskatchewan.

Chapter 7: What Farmers Said About Machinery Companies and Machines

The questionnaire gave farmers several opportunities to express opinions about their machines and the companies which supply them.

Three-quarters Found Manuals Inadequate

More than a quarter of the sample farmers consider machinery company manuals adequate as they are, another 69 per cent say they need improving, and about 2.5 per cent say manuals are no good at all¹.

² See survey report, question 26.

³ See survey report, question 27.

¹ See survey report, question 31.

There is little difference between smaller and larger farmers in opinion about manuals. However, slightly more of the farmers with some technical training consider manuals no good or need improving than do farmers without the training.

TABLE XXXIV
RELATIONSHIP OF TECHNICAL TRAINING TO ATTITUDE ABOUT MANUALS

	Number of farmers	Adequate	Need improving	No good
Training.....	172	23.84%	71.51%	4.65%
Without training.....	637	29.67	67.98	2.35

Why Farmers Found Manuals Inadequate

Most of the farmers say machinery company manuals are inadequate because they give detail for casual servicing only and not for general overhaul and repair. Some blame the manuals for not having sufficient detail and for not having clear enough diagrams and cut-aways of hidden parts. Some say descriptions and adjustments are for North America generally and often do not apply to Western Canadian conditions. Many complain that instead of giving details about overhaul the manual merely says to see the local machinery agent and many claim the agent is often not as well qualified to do the repair work as the farmer himself. They report some agents have no training whatever in machine shop or motor mechanics.

The following are some detailed quotations from the questionnaires giving in the sample farmer's own words opinion about the company manuals:

A 12-quarter farmer in Wheat Pool District 11 said: "For price paid for machinery the instruction books are not adequate, not enough detail on how to remove some shafts and gears and different parts on the machinery."

A 17-quarter farmer in District 3 said: "Complete repair part manuals should be supplied with every machine. They are not now so supplied. Instruction manuals are not complete, only very elementary and do not deal sufficiently with repairing instructions. Repair instruction books similar to those supplied garages and dealers should be supplied to every farmer with the purchase of each machine, especially with tractors, combines, balers, etc."

An 8-quarter farmer in District 4 said: "Most manuals tell you only how to run the equipment. If anything goes wrong they tell you to go see your dealer who, in many cases, knows less about the machine than you do. Some of the older manuals were much better."

A 5-quarter farmer in District 10 said: "Manuals have a tendency to emphasize conditions in crops in the United States which do not apply to Canada. This space could be used to give greater details of Canadian conditions; repair procedure should be in line with tools usually found on farms or in small town shops."

A 5-quarter farmer in District 16 said: "Machinery companies figure we have dealers who will do our major repairs promptly but such is often not the case. More repairs are done at home here and often have

to be done without any guide whatsoever, as company manuals are very basic and contain no guide for major repairs. Regular dealers are often out in the country delivering fuel when wanted for repairing."

A 3-quarter farmer in District 1 said: "All hidden parts should be well pictured. Difficult parts to get off should be explained. It would save a lot of time and worry."

On the other hand, some sample farmers consider manuals adequate.

An 8-quarter farmer in District 11 said: "Manuals are usually adequate. Be sure you have the right manual."

A 4-quarter farmer in District 1 said: "Yes, I think manuals are adequate but most farmers do not study them thoroughly."

In District 16, a 6-quarter farmer said: "Most manuals are adequate but farmers aren't because they do not read them."

Why Farmers Found Some Machinery Unsuitable

Some sample farmers consider their machinery not suitable because they say it is too light and will not stand up well under their farming conditions. Some say the machines are too hard to adjust. One sample farmer says there are many costly trades today because the farmer cannot overhaul a motor himself or he doesn't trust the local repair man to do a satisfactory job of rebuilding the unit. That same man says few modern tractors are built with a view to having them overhauled on the farms.

A 11-quarter farmer in Wheat Pool District 10 said: "I have a fairly good and complete line of machinery complete with multiple hook-ups, etc. for a large farm operation. However, each year seems to require different tillage methods depending on moisture conditions mainly. No one farmer can afford to own every machine necessary since some machines may be needed one year and then not again used for years. Co-operative or partnership ownership is also not too successful since all parties usually require the same machine at the same time."

A 6-quarter farmer in District 5 said: "A farmer who has had some mechanical training and possesses even a few good tools on the farm is in an enviable position. Many costly trades are made today either because the farmer cannot overhaul the motor himself or he doesn't trust the local repair man to do a satisfactory job of rebuilding the unit. Very few modern tractors are built with a view of having them overhauled on the farm. Specialized equipment and training is needed here."

Some of the farmers identified specific machines in relating their complaint about equipment.

Comment on Farm Breakdowns

The questionnaire asked farmers who had more than one breakdown in 1960 to give details. Some of them did.

A 5-quarter farmer in District 13 said: "Here is one example. I needed a new armature and brushes for a motor for a hydraulic lift on a combine. They were not available in town or city. I made many telephone calls to nearby towns. One agent said he had the required motor complete. I went 24 miles to get it and it wasn't the right one. At the end of three days I found a service man who ground down the armature so it would work. I still haven't found a new armature."

A 5-quarter farmer in District 12 said: "This tractor I have is a good example of what I find is wrong with most machines today. I have had serious breakdowns with it. Each time the company says 'yes, after we made the tractor we found this or that piece did not stand up satisfac-

torily so they made something different'. Meanwhile I am having much loss of time and money while they are learning how to make a tractor."

An 11-quarter farmer in District 11 gave a different kind of answer to this question. He said: "If a farmer puts a machine into a field without overhauling it first, he naturally will have more breakdowns and delays. If there is enough time spent in overhauling it first, it may be possible to run a complete season without any delay. Actually, this year I was not held up at all due to parts not being available."

General Comments About Machinery Companies

There was a generous response to two omnibus questions. One asked "What suggestions can you make to improve the farm machinery situation, either for new machinery sales and distribution or availability of parts and repairs?" The other asked "Do you have any comment to make on price of new equipment or repair parts?" Nearly every farmer had something to say to one or other of these questions.

We have segregated the replies and selected some of them to report here. They are recorded under six categories:

- (a) Comments of a general nature or omnibus remarks which take in many factors;
- (b) Suggestions for greater co-operation among farmers or concerning Canadian Co-operative Implements Limited;
- (c) Criticism of machinery companies and suggestions for them;
- (d) Comments mainly about repair parts and facilities;
- (e) Proposals concerning machinery testing and research; and
- (f) Comments mainly about price.

More sample farmers complain about price than any other single factor.² The second most common complaint is about the availability of repair parts. A good number of farmers complain about the lack of standardization of machinery parts and several others say there are too many model changes. Farmers in all 16 Wheat Pool districts mention these four principal complaints. Other main complaints are that machinery dealers do not give adequate service, that there is not enough testing of new machinery and that warranties and guarantees are not adequate.

But the comments are not all critical of machinery companies. Many farmers advance proposals which may not affect companies themselves but which may improve the farmer's ability to acquire additional machinery more easily.

I understand that you do not wish me to read the comments from the farmers themselves. That being the case, I now go on to page 43.

A 6-quarter farmer in District 2 said: "I think the machine companies are not such villains as most other manufacturers. They do not, in general, hide behind tariff walls. The Wheat Pool or the Dominion government or anybody else could carry on investigations of the high price of this or that until Doomsday and not change the basic situation, which is that wheat farmers sell at low world market prices and buy in protected home markets at high prices. Throw the tariffs and all the loafers that hide behind them out the window and we will be all right."

A farmer who operates 4 quarters in District 4 said: "I believe the average farmer today buys too much new machinery, that is, they do not use them long enough before trading them on another new or larger one. We can't quarrel with the method if the farmer is well-to-do and probably in the income tax brackets, but I do believe the average or lower than average income farmer could get along with less new machinery."

² See survey report, question 32.

Another man in District 5 who operates 5 quarters suggested that the west should consider withdrawing from the rest of Canada. He said: I hope you don't think I am unreasonable but I do believe we should consider a withdrawal of Western Canada from Canada. I don't believe it practical to buy machines and supplies from Ontario at probably the highest prices in the world and sell our produce to countries after import restrictions have been made to protect Ontario and Quebec. I believe countries like Japan could supply us with more cheaper goods even fairly close copies of our present machines if they knew there was a market here. Of course, I am not informed on this and believe it should be only considered and investigated."

A 2-quarter farmer in District 8 who said he was a set-up man and service man for implement companies for four years said: "The mark-up between wholesale and retail 30 to 40 per cent is too great. Usually insufficient repair parts in stock for the latest model machines. Also repairs for 10-year-old machines are almost obsolete; in far too many instances machines are oversold as to actual performance. For example, combines and tractors. In some instances, quite numerous, warranty policies are not fulfilled as freely as advertised during sales campaigns."

(A) General, Omnibus Observations

Here are some sample quotations from questionnaires giving some general comments of an overall nature.

A 6-quarter farmer in District 15 said: "The local dealer should order new machinery direct from the factory; dealers should be equipped with tools and machines and be qualified to service any machine he sells. Dealers should stock a new line of parts for a specified length of time for any machine he sells. Comparison tests of machines by the agricultural machinery administration should be made available to all farmers. The Agricultural Machinery Act even as it is should be rigidly enforced."

A 10-quarter farmer in District 13 said: "Some repairs come in kits containing parts that don't wear out, thus causing the price to be higher than necessary. Some wholesale machine companies only allow dealers a certain amount of orders a day, usually two, thus, if the dealer doesn't stock every part, a customer may have to wait over for a repair; it is certain machine and repair prices are too high. I don't know the answer. However, a financial backing of Co-operative machinery would be one way. This would hold the price line very well on the few machines they manufacture. They should be manufacturing a full line."

A 5-quarter farmer in District 9 said: "Machinery and repairs are too high in price to buy. If the price on farm products would have gone up in proportion, especially grain, then the price on machinery wouldn't be too high. Better fenders on tractors for safety and dust, power brakes on tractors are too dangerous for high speed travel but good for field work only; parts and repairs on foreign cars, trucks and machinery take too long to get; metal parts such as body and combines, trucks, cars, are too thin. The vibration cracks the metal very easily. Spot welds on metal parts as bodies, radiators, guards, shields, too poor. Road gear on any make of tractor should not be more than 12-15 miles an hour. Anything faster is too dangerous."

A 5-quarter farmer in District 6 said: "Consumers should have more protection against 'lemons'; less rapid change of models of machinery would help parts problems; price of machinery out of line with

price of farm products, repairs too high also; high price of equipment should warrant a rigid, lengthy guarantee of service and performance to compensate consumer for initial cost."

A 3-quarter farmer in District 6 said: "This questionnaire is a brilliant idea because it takes in the opinions of a cross-section of farmers holding offices in farm organizations, knowing of the high cost-price squeeze and many recognize that it is also the high price of farm equipment which is a factor."

(B) Suggestions for Greater Co-operation Among Farmers

Typical of the comment among the farmers about purchasing of farm machinery through the co-operative is this from an 8-quarter farmer in District 14.

He said: "If farmers would buy their machinery from their own organization, the Canadian Co-op Implements Limited, we could have better repair service, eliminate costly distribution and duplication of machines. In a few years all machine companies would be willing and anxious to deal with C.C.I.L."

Another farmer says there should be more co-operation and partnership among the farmers in the ownership of machinery.

The 3-quarter farmer in District 5 said: "I should let you know that my brother and the two close friends have gone into partnership with me on a baler, a weed sprayer, a rock picker and post-hole digger. There are more machines that farmers don't use very often and they could own in partnership and enjoy the comforts of modern machinery that they could not possibly buy if they had to pay the shot themselves. We split everything four ways and don't have any trouble."

Another farmer considers co-operatives should manufacture machinery in Western Canada.

The 7-quarter farmer in District 10 said: "Why isn't there a machine company manufacturing machinery and parts in Western Canada? There will be plenty of electricity, there is lots of iron ore in northern Saskatchewan. Why hasn't it been developed? Why don't the Pools, the Co-ops, etc. start developing so that when the dam is completed and power is available, they could manufacture their own machinery."

A 2-quarter farmer in District 15 said: "Many times are the machine companies always degrading anything the farmer owns, such as C.C.I.L. and Co-op products. For example, I purchased two Co-op tires. I was almost afraid to go to the local garage for air. The shining Co-op sign on the tire burnt a hole in the local dealer's pocket. It takes guts to buy Co-op products and live with the local town folk."

A 2-quarter farmer in District 14 said: "Farmers should use the facilities of C.C.I.L. at least 10 times more than they do. This would enable C.C.I.L. to give nearly complete service and allow for standardization of parts and machines at lower costs. The responsibility for the farm machinery situation rests partly with the farmers themselves. We do have C.C.I.L. but as a group we use it only partly."

A farmer who operates 9-quarter sections in District 1 said: "I think if there was more co-op work done by farmers to get the full benefit out of any machinery purchased that would lower his operating cost and be sharing his investment with others. I would like to see more farmers buying Co-op implements."

(C) *Specific Criticisms of Machinery Company Practices*

Sample farmers believe machinery companies change models too often. They recommend standardization of parts, not only among companies but within one company between one machine and another. They say many new machines are too complicated and fancy and that this feature coupled with rapid and frequent model changes requires the dealer to carry a large repair stock inventory. They criticize the companies for keeping regular hours during the busy season and say machinery agencies and depots should remain open for longer hours, especially during the weekend.

A 3-quarter section farmer in District 14 said: "Machine companies are changing models too often which not only makes everything more expensive but it is also more difficult to keep repairs for so many models. It would be a great help to farmers if there were more standardization of parts, not only between the different companies but in their own individual set-ups. It would appear that machine companies deliberately make such things as bearings, sprockets and break-away couplings all of a different size or shape so that one will not fit the other. This is not necessary and often causes much delay."

One of the biggest farmers who answered the questionnaire—he operates 24-quarter sections in District 11 said: "New machines are getting too complicated and fancy with a lot of nice but unessential accessories. The cost of these accessories adds to an all-ready inflated price. This feature coupled with rapid and frequent model changes requires the dealer to carry a large and varied stock inventory. This is the reason for the complaints about dealers not stocking repairs. The price of repairs is away above the original purchase price. If a farmer bought enough parts to assemble a complete machine, it would cost nearly double the price of a new machine, factory assembled. Price increases are not in line with increases in labour and material cost."

Farmers say some machines have specific items they consider unnecessary and they advanced detailed proposals for greater standardization.

An 8-quarter section farmer in District 15 said: "Most companies come out with increasing number of new devices which are not necessary. For example, torque amplifiers, hydraulic seats, power steering on combines, cigaret lighter, etc. These are added to the cost of the tractor or other machine."

A 1-quarter section farmer in District 1 said: "Manufacturers should be standardized . . . should standardize wheels and hubs, also power take-off drives. V-pulleys, hubs and most bearings should also be made so they would inter-change with other makes of machinery."

A 2-quarter farmer in District 15 said: "Machinery repairs are too high because there is too much variety. Why 100 different carburetors, oil filters, spark plugs, bearings, gas line filters and ignition parts? These should be standardized. Machinery should also be designed to allow for repair work. A combine is now made like a house, from the bottom up. When the bottom wears out, it means complete disassembly, or near it. I would also recommend the metric standard."

Quite a few sample farmers make suggestions about machinery company agents and about how far apart agencies should be located.

A 4-quarter section farmer in District 8 said: "To improve the machinery problem I believe the company should have less implement agents instead of agents about 30 miles apart, and have these agents stock more parts. These dealers should have a man that has a knowledge

of adjusting, setting and operating of machines. Farmers should be encouraged to repair their machinery off-season by discounting prices on parts and overhaul."

Another farmer who operates 3-quarters in District 16 said: "I would suggest that retail outlets be fewer but better. I would rather go 40 miles and be reasonably sure of getting what I require."

A 5-quarter farmer in District 7 said: "Eliminate 60 per cent of the local dealers. Reduce the dealer's commission by 60 per cent. This would prevent the present, ridiculous high commission offset by high trade-ins. In most cases the manufacturer's warranty costs more in time than the service is worth. In harvest time at least, repairs should be available for more than the present five days per week."

A 6-quarter farmer in District 6 said: "Machine agencies are decreasing throughout the country simply because the companies are driving a harder bargain in their dealerships. This in turn means the farmer has many more miles to drive to get repairs. Agents have told me they have a more difficult job today selling second-hand machines that are not represented by its own agent within a reasonable distance of the purchaser's farm. These machines sell best around city or larger towns where there is an agency."

An 11-quarter farmer in District 10 says: "he would like to see a machine produced which would be so versatile that they could be converted to handle any and all tillage and seeding operations required." He "believes that such a machine could be built at a practical price, attachments could be mounted quickly and cheaply for any variation encountered in the different seasons."

A 2-quarter farmer in District 14 said: "I suggest that machine companies make the same model for five years before making a change. It is only a sales feature to change the model of a machine."

An 8-quarter farmer in District 4 said: "I think the machine companies spend far too much in advertising and changing models, more so than cars."

A 6-quarter farmer in District 3 said: "I do think machine companies make too many changes. For example, when they turn out a good tractor, they keep making and selling that tractor for 8 to 10 years. As it is, they seem to put out inferior machines and make a lot of money selling the owners of new machines new parts and modifications."

A 2-quarter farmer in District 3 suggested implement companies: "Should provide some lesser modernized equipment so that smaller producers would be able to purchase such equipment."

Another group of farmers think they are paying too much for advertising and for what they call gimmick attractions to maintain increased sales.

A 4-quarter farmer in District 1 said: "Money spent on advertising and gimmicks to make sales could be better spent in more thorough testing before the machine is put on the market. Machines should be made to wear instead of wear out. Doubtless most machines could be made to last much longer at little or no extra cost but if they lasted twice as long the companies would only sell half as many."

A 9-quarter section farmer in District 10 said: "I think that the solution to the problem would be for the machinery companies to abandon such expensive fields as torque amplifiers, automatic transmissions and too large self-propelled combines and concentrate on more serviceable, less complicated equipment at a lower price, retaining recognized improvements such as diesel engines and live hydraulics, but discarding extra sales gimmicks."

A 2-quarter farmer in District 16 said: "I believe machinery companies should concentrate their efforts on the weak spots of their present inventions. In any case it is poor workmanship. For instance, wells break almost before they get to work. Another thing, I think, all manufacturers should take a grease gun and give the machine a thorough going over. It would be very revealing to them to discover what miserable places companies now put grease nipples."

A 2-quarter farmer in District 13 said: "Not all so-called improvements to machinery are good. I also object to the tendency of creating a style conscious advertising. I consider most advertising of new machinery a waste of money."

(D) Views About Repair Parts and Repair Facilities

Farmers consider many agents do not keep sufficient repair parts both for current machines and for older models. They suggest that standardization of parts might help in the keeping of this great variety of parts. They also don't think some agents are able to do repairs required of them.

A 4-quarter farmer in District 2 said: "Machinery companies must have records of parts sales from previous years, so why not have enough parts at distributors so that they do not have to be back ordered to the factory in busy seasons."

An 8-quarter farmer District 3 said: "All that is needed to run an agency today is to have a parts book and a telephone. You will get your repairs in by bus or rail or truck a few days later and hold the work up for weeks."

On standardization of parts they advance some specific suggestions.

A 7-quarter farmer in District 2 said: "Machine companies should use standard bearings, shafts, chains, pulleys, sprockets, which are interchangeable and which are identifiable by a similar code number, so that a John Deere bearing could be obtained at an International garage by number."

An 8-quarter farmer in District 4 said: "I think parts could be more standardized. For instance, there is one combine that has only three different sizes of bearings. This dealer would only need three bearings in stock, whereas others would need 25 or 30. I think they change models too often."

A 4-quarter farmer in District 14 said: "I feel there should be standardization of parts such as knife sections, cultivators and shovels, and rake teeth, etc. One dealer told me the company he worked for made 16 different knife sections although he didn't keep any on hand as it was impossible to keep enough for so many different sizes."

A 9-quarter farmer in District 15 said: "Bearings from different companies should have standard numbers. Many bearings are the same size but each company has a different number so it is hard to find replacements. I could farm with one or two cows less but I couldn't farm without a welder and a complete repair shop on the farm."

A 3-quarter farmer in District 16 said: "Standardization of repair parts, especially bearings."

In a general comment on the availability of repairs, a 2-quarter farmer in District 16 said: "When we go to North Battleford which is 50 miles, nine times out of 10 they have not even got the repairs needed there but they always say they will give me a good deal on a newer model, and if we don't bite on the bait then they lead out and just try some other sucker that seems to have more money than brains and quit trying to get any repairs for any model over three years old. I

have told more than one of these screwball implement agents that can't put a wheelbarrow together right what I thought of their service but so far gained no dice."

A 6-quarter farmer in District 3 said: "When machinery gets over five years old it is harder to get parts without waiting for some time.

(E) Proposals for More Machinery Research and Testing

Sample farmers propose that machinery companies should do more research on models, that there should be more research work by universities, by the machinery administration and by independent organizations. They also suggest companies should have more field demonstrations and should hold schools during the off-season. Some suggest the use of television for demonstrations and lectures during the winter months.

A 9-quarter farmer in District 10 said: "I think that the machinery companies should hold more schools to describe their machinery, how it works and how to correct its faults. No one finds the faults quicker than the man that uses it. Many companies high pressure the sales of their machines, then the local agents do not have repairs or services to meet the needs."

A 4-quarter farmer in District 13 said: "I think that the machine companies should have more field demonstrations, hold schools for operators of machines to get the operator more acquainted with the machine."

A 6-quarter farmer in District 4 said: "With some companies and some machines it is not possible to get a demonstration before purchase, hence there is no real indication of its true capabilities."

An 8-quarter farmer in District 1 suggested bringing new machinery to the west to test other than the Regina plains. He also suggested that the companies stock parts for machinery up to 15 years old.

A 12-quarter farmer in District 12 said: "New machines should be tested by a neutral concern with reports available to the farmer upon request from the university of that province giving comparison of capacity and power required to pull same in certain soils."

A 4-quarter farmer in District 3 said: "I feel that time allowed for a farmer to reject a machine when new when bought is too short and should be extended to a long enough period that the machine can prove its worth. There is only one week or 10 days and in that time a farmer may not get a chance to use it."

An 11-quarter farmer in District 11 said: "Another phase of the farm machinery situation that could be improved on is more thorough research should be done by manufacturers in building machines suitable for different situations in different parts of the country. This would also apply to parts that wear out frequently."

(F) Comments About Prices of Machines and Parts

There is little disagreement about price. Farmers think the price of new machinery and the price of repair parts too high. They say it is too high compared with the same part in previous years, too high compared with the price on other kinds of equipment they use, and too high compared with the return from their farm produce.

A 5-quarter farmer in District 2 said: "I think today we have a very good line of new farm machinery on the market. Repairs are plentiful but the cost of this machinery and repairs today is going to break more and more of us small farmers. On my farm I find it impossible to grow enough wheat to keep a fairly new line of machinery."

A 5-quarter farmer in District 14 said: "I am tired of getting loans from the banks, etc. to replace worn out machinery to raise \$1.13 wheat and buy \$10,000 combines, \$7,000 tractors, etc. We are always paying loans and interest, instead of paying cash. We are living on depreciation of our machinery, then when we replace some of it is hard to run to the various credit companies to fill these pockets."

A 6-quarter farmer in District 10 said: "I would suggest that if machine companies would standardize a machine and keep it that way for a few years with none but minor modifications, the price could probably be reduced, or at least maintained at the present price. In other words, at the present time we are not buying machines as much as we are paying for retooling factories. I think, if the companies wanted to, they could produce the machines for less."

A 2-quarter farmer in District 16 said: "At the present time no small farmer can afford to buy a new machine on the present quota system and the price of wheat. In our district there has not been a large major implement bought in the last six years because of the high cost."

A 4-quarter farmer in District 9 said: "Prices of precision parts like ball and roller bearings are reasonable. Prices of simple parts and welded assemblies are sometimes fantastic. Mass production and automation account for part of this difference, but the difference seems too great."

A 7-quarter farmer in District 14 said: "It seems superfluous for me to say that machine prices are absolutely out of line with prices received for farm goods. For instance, in 1947 I paid the equivalent of 1,800 bushels of No. 2 wheat for a 12-foot combine. In 1952 I paid the equivalent of 3,800 bushels of No. 2 wheat for a 12-foot combine, and in 1960 the same 12-foot combine would have cost me 6,400 bushels of No. 2 wheat."

A 3-quarter farmer in District 13 said: "The price of new machinery has gone beyond the point where a farmer on three quarter sections or less can buy for himself any new large equipment. He has to buy used equipment. Repairs on old equipment are excessively high because the local dealer does not carry them. All extra telephone calls and freight charges on small orders add extra cost to already high-priced repairs. This is also beginning to apply to new machines as wholesale houses are now farther apart."

Conclusions: Sample farmers advance a variety of complaints about what is wrong with the present farm machinery operation and suggestions about how the wrongs may be corrected. They complain that company manuals are not adequate, that companies do not provide the right machines for the work farmers have to do, build the machines badly, add too many fancy attachments and make no apparent attempt to standardize components and parts. They consider machinery companies do too little testing of machines, high-pressure farmers into buying the machines and then do not stand by warranties nor provide adequate staff or parts to effect repairs. They say machine companies do not gear their work hours and facilities to the farmer's needs and spend too much time and effort on advertising and promoting. They say prices are too high and they advocate increased co-operation among farmers and greater support by farmers of existing co-operative facilities for the purchase of machinery. These observations by the farmers will be considered further in our summary of conclusions and recommendations.

Chapter 8: Summary of Conclusions and Recommendations

Saskatchewan Wheat Pool welcomes this opportunity to appear before the standing committee of the House of Commons on agriculture and colonization to submit the views of organized Saskatchewan farmers during this investigation of farm machinery prices.

This submission makes a variety of points to indicate not only that current prices of farm machinery and repair parts are too high but also that a variety of other issues contribute in one way and another to increasing the burden for the farmers who must meet these prices. One of these additional factors is the continuing pressure for farmers to enlarge their land holding and to increase their investment to improve their farming operation. Sample farmers indicate in many ways that those of them extending their farming operation are the least able to acquire additional machinery which the expanded farming operations demand. Another additional factor is the increasing diversification of the farming operation. Sample farmers indicate that those who are expanding their farming operation by diversifying have increased pressures to acquire additional machinery. More mixed farmers than grain farmers, for example, have too little equipment for their operation.

In these twin adjustments—extension of land holding and diversification of farming operation—government policies have through the years contributed considerably. Governments must be encouraged to continue their assistance during the periods of major adjustment and must remain vigilant to see that their agricultural policies continue to assist and not to hinder these adjustments. It will follow that government policies effective for these adjustments will also assist farmers to resolve at least some of their farm machinery problems.

Some farmers are attempting to resolve the problem of farm machinery price for themselves by buying second-hand machinery. It is the smaller farmers and those currently engaged in extending their operations who are less able to buy the new machinery and more dependent on second-hand purchases. But there is ample evidence in the replies to the Wheat Pool's questionnaire that facilities for second-hand machinery may not be fully adequate. The fact that most new machinery dealers are themselves in the second-hand machinery business does not mean that their facilities for providing second-hand machinery are good enough.

Of the sample of 887, no fewer than 372 farmers say dealers do not stock enough parts; another 11 say dealers should be better able to repair machinery; 83 say there are too many model changes; and 94 say dealers should provide better service. All of these farmers in one way or another are saying that farm machinery dealers as they are presently organized and equipped are not able to supply what farmers consider to be adequate second-hand machinery. The fact that more farmers in total buy second-hand trucks than buy new trucks suggests that the well-organized used motor truck distributive system might be a major factor. These observations should suggest a new course of action for the farm machinery industry.

When it comes to consideration of the current value of farm machinery inventories it becomes apparent that some farmers experience more difficulty in acquiring and maintaining adequate inventories than do some other farmers. The smaller farmers generally report smaller inventories than do the larger farmers although some of the smaller farmers have more investment in machinery than have some larger farmers. On the whole 18 per cent of the 887 sample farmers have machinery inventories valued at current prices under \$5,000; 33 per cent of them have inventories valued between \$5,000 and \$10,000; 37 per cent have inventories between \$10,000 and \$20,000;

nine per cent between \$20,000 and \$30,000 and just over two per cent have inventories of more than \$30,000. Comparing these figures with the average machinery inventory of \$9,782 reported in 1959 by the 455 members of the 42 farm management clubs operated by the Saskatchewan department of agriculture suggests that sample farmers may have higher machinery inventories than have the average of all Saskatchewan farmers. This tends to make suggestions from these farmers—on the average better equipped farmers—all the more valuable to this parliamentary committee.

Of the sample farmers, those engaged in mixed farming have the higher valued machinery inventories, supporting the contention that diversification of the farming operation increases the farmer's need for additional machinery. While it is true that diversification for some farmer improves his ability to purchase machinery because it enhances his cash income, it is also apparent that it increases his need for additional machinery.

Farmers expanding their operation by renting or purchasing additional land have smaller inventories than farmers who own all of their land with no regular annual claim on their income for land payment.

These suggest that government policies designed to aid adjustments into larger land holdings and into more diversified farming operations must be carefully planned and executed.

However, government assistance aside, there is much farmers can do collectively to help themselves to acquire the use of additional farm machinery. The survey considers in detail the influence of custom hiring and renting of machinery and of machinery sharing among neighbours. Half of the sample farmers have no part in custom hiring and renting and 40 per cent of them have no part in machinery sharing. The fact that machinery sharing and custom hiring is widespread throughout the province—all wheat pool districts report general utilization of each—suggests that the farmers not now utilizing either should consider these two facilities as available methods of extending their machinery use without increasing purchases. Farmers should also explore opportunities for the co-operative ownership of some machines among individual farm operators.

Farmers who buy machinery on credit use banks more than other credit facilities and about half of the farmers who use credit for machinery get it under the Farm Improvement Loan Act. The Act was established in 1944 to provide credit to farmers who might have difficulty establishing lines of credit without government guarantees. There have been some changes in farm improvement loan terms during the years, increasing the maximum term to 10 years and the maximum amount to \$7,500. Interest now is five per cent. However, while maximum amount and terms have been extended greatly for some farm improvements they remain somewhat less favourable for the purchase of farm machinery. Some sample farmers suggest improvements in the loan act's terms which now allow only three years for repayment of loans for new machinery, seldom more than one year for second-hand machinery, and provide credit up to 75 per cent of the purchase price of new machinery to a maximum of the \$7,500.

The fact that larger farmers tend to use farm improvement loans more than do smaller farmers—or at least no less than do smaller farmers—suggests that banks may not give sufficient consideration to the smaller farmers whose financing the improvement loan was really established to guarantee. The widespread use of farm improvement loans for machinery purchases may be the main reason why only 16 per cent of the sample farmers get their machinery credit from credit unions which do not have access to farm improvement loans. On other occasions representatives of the co-operative

movement have proposed extension of farm improvement loan facilities to credit unions and Saskatchewan wheat pool suggests again that this should be considered by this standing committee.

There is little doubt that better farm workshops and training for farmers in motor mechanics and machine shop techniques contribute to farmers' ability to maintain their farm machinery and equipment, to buy more second-hand equipment and to reduce delays in the farming operation because of sudden breakdowns. Farmers among the sample who have some technical training indicate they have better farm workshops than those who have no training and that they buy more second-hand machinery. Farmers with technical training are also slightly less satisfied with the machinery they do have which suggests they may be better able to tell when a machine is suitable or not. Some farmers suggest that machinery companies should conduct more courses for farmers in the repair and use of their own line of equipment. One farmer suggests the use of television in the winter months to help educate farmers in workshop techniques. Governments should also consider extending programs now available to help farmers take this kind of training in the winter months.

The sample farmers are highly critical of some machinery company practices. They claim that agents do not provide adequate service, that company depots are not open at the hours of greatest convenience to farmers, that dealers are not able to help or advise on machinery repairs and that guarantees and warranties are sometimes not all they might be. These suggest that companies should consider amending their ways. In most instances it is not legislation which prohibits them from keeping agencies and repair depots open in the evenings and on weekends during busy farming seasons but rather their own internal labor force arrangements and the companies themselves could effect changes in their practices. If the claim that agents are not qualified to complete repairs is valid, machinery companies should consider reassessing the kind of men they employ as agents. Consolidation of their agencies into fewer locations could help them to improve the quality of employees. Consolidation would certainly contribute to the machinery company's ability to maintain a better line of repair parts.

On the consolidation of machinery company facilities, it is pertinent to recall from the survey that more than 30 per cent of the sample farmers now drive more than 50 miles for their repair parts. Few sample farmers complain about the distance they drive but many complain about the availability of parts and the quality of service once they reach the agency offices. The 1960 annual report of the director of Saskatchewan's agricultural machinery administration, which among other functions administers the licensing in the province of farm machinery vendors, reports little change in the last decade in the number of licensed vendors although the number of farmers has declined from 125,000 to an estimated 97,000. This suggests there now are more vendors per farmer than there used to be rather than fewer. The farmers say fewer would provide better service and facilities.

Farmers are highly critical of manuals now supplied by machinery companies with new equipment. If their criticism is valid it warrants serious consideration by both machinery companies and government regulatory bodies. More than 70 per cent of the sample farmers consider manuals inadequate and of these some say they are no good at all. The fact that farmers with technical training in workshop techniques are more critical than those without suggests there is considerable merit to the criticism. If machinery companies do not assure suggested improvement in their manuals this committee should consider advising government to direct and require this kind of improvement.

The subject of standardization of farm machinery parts is not a new one to the members of this committee nor in fact to anyone concerned with agricultural matters in Canada. Observations made by some of the sample farmers suggest the situation demands immediate action. This committee should be able to acquire direct information from the machinery companies on what plans they have underway for greater standardization of equipment parts. It is plainly evident that the lack of standardization of even the most simple parts contributes directly to the farmers' problem of acquiring adequate repairs, to the machinery companies' supplying of those parts and to the continuing high cost of maintaining an adequate line of farm machinery.

Two-thirds of the sample farmers consider their machinery suitable. The remaining, who apparently consider machinery inadequate in one way or another, give a variety of reasons. Some complain about quality and workmanship in machinery construction. Some consider machines unadaptable to their land formation because the machines appear to be designed for the international market with widely differing farming conditions. Farmers urge increased testing facilities and more research into fundamental design changes. Some ask for longer periods in which to try new machines on their own land before purchase agreements are completed. Saskatchewan wheat pool would commend these farmer suggestions to consideration by members of this committee, by representatives of the machinery manufacturing industry and by government bodies now concerned with research and machinery testing.

Following a similar farm machinery investigation some years ago the farmer's co-op machinery company, Canadian Co-operative Implement Limited, was formed and now is in operation across the West. Some 34 sample farmers suggest at least some of their present problems could be resolved through increased support of C.C.I.L. One of the most direct suggestions for increased support for C.C.I.L. is advanced by a sample farmer operating eight quarter sections in wheat pool district 14. He said:

If farmers would buy their machinery from their own organization, the Canadian Co-operative Implements Limited, we could have better repair service, eliminate costly distribution and duplication of machines. In a few years all machine companies would be willing and anxious to deal with C.C.I.L.

Saskatchewan wheat pool realizes that merely to state this does not by itself increase farmer support for their co-operative machinery company. Farmers as consumers are much like any other kind of consumers, they prefer to have the widest possible choice and they want the opportunity to make their own selection voluntarily. But Saskatchewan wheat pool can say from its own experience that the surest way to encourage farmers to increase support for C.C.I.L. is for machinery companies to continue without effective change the practices outlined and criticized in this submission. C.C.I.L. has proven that it can market suitable and adequate farm machinery at prices below the average of the private and corporate machinery companies and it has also shown that it has facilities to claim a larger share of the market from one year to the next.

Saskatchewan wheat pool urges its own farmer members and all other prairie farmers to consider facilities and machinery offered by C.C.I.L. before making any machinery purchase. By increasing support for C.C.I.L. farmers can improve their real position and they can encourage the other machinery companies to amend their policies and practices criticized in this submission.

The terms of reference establishing this particular investigation appear to limit the scope of the enquiry to price. The actual wording of the parliamentary

motion is that: "the standing committee on agriculture and colonization be empowered to enquire into the prices of farm machinery and to report to the house thereon."

Saskatchewan wheat pool submits that investigation of price alone is not enough and has introduced a variety of issues which along with price contribute to the farmers' real cost of acquiring and maintaining adequate farm machinery. Some of our observations indicate the direction of changes machinery companies should take, some suggest changes in government action and some urge farmers by themselves to increase cooperative activity to resolve some of the issues.

Summary of recommendations

In conclusion, Saskatchewan wheat pool submits that direct and indirect action along the following lines will contribute to the resolution of the farmer's problem of acquiring and maintaining adequate farm machinery at prices and real costs he can support, and recommends:

1. That machinery companies move to reduce the price of farm machinery and repair parts by reducing the number of models, standardizing model components and repair parts, eliminating unproductive machinery features, consolidating their machinery agencies and repair depots, improving the quality of service offered and improving facilities and staff;
2. That machinery companies improve their facilities and staff to offer more properly repaired and adequately renovated second-hand machinery;
3. That machinery companies improve machinery manuals and offer farmers improved technical training in farm workshop techniques;
4. That machinery companies take whatever action they require to provide evening and weekend services for farmers, especially during busy farming seasons;
5. That the federal government review legislation and practices affecting the operation of farm improvement loans to assure their fullest use by ordinary farmers, that it have amended the Farm Improvement Loan Act's terms to improve loans for the purchase of new and second-hand farm machinery and that it extend the Farm Improvement Loan Act's facilities to credit unions on terms similar to those now provided for the chartered banks;
6. That both the federal and provincial governments have reviewed legislation under which farmers now are provided courses of training in the operation of farm workshop tools and equipment to ensure maintaining and improving the quality of training available and financial assistance for farmers willing and able to undertake the training;
7. That governments, organized farmers and individual farmers themselves consider methods of encouraging custom hiring and renting, the sharing and the co-operative ownership of farm machinery in areas and under conditions where each is feasible and desirable; and
8. That farmers by themselves support to a greater extent the operation of Canadian Co-operative Implements Limited, the farmer's own machinery manufacturing and distribution co-operative.

All of which is respectfully submitted,

Saskatchewan Wheat Pool.

The CHAIRMAN: Thank you very much, Mr. Gibbings.

Gentlemen, we now will commence with the questioning of our witnesses. Have you a question, Mr. Rapp?

Mr. RAPP: Mr. Chairman, first of all, I would like to congratulate Mr. Gibbings for bringing in such an enlightening brief.

I must say that this brief is one of the best that we have received, and I think, to a certain extent, that it must be attributed to our new wheat pool president in Saskatchewan, Mr. Charles Gibbings.

Charlie, or should I say Mr. Gibbings, is a Saskatchewan product and, during the course of his life, has farmed. He grew up with the Saskatchewan wheat pool and, if I understand correctly, he farmed at one time in the Rose-town district.

Mr. GIBBINGS: And, I still do.

Mr. RAPP: The Rosetown district is a very good one, but I do not think it is quite as good as Melfort-Tisdale.

Mr. HORNER (*Acadia*): How about Humboldt?

Mr. RAPP: Well, that, as well.

Mr. Chairman, I fully concur with the eight recommendations which the Saskatchewan wheat pool brought in, and I think that it would serve well if the committee concentrated on these recommendations. If we do this, I think we will be able to fulfil what is expected of us.

Mr. Chairman, this is all I have to say at the present time. I notice that there are only a few minutes remaining before the house sits.

Mr. GUNDLOCK: Mr. Chairman, it was mentioned here that the terms of reference were not broad enough, so I would like to take the liberty of stepping beyond them for a moment.

I would like to ask a question in regard to storage because, after all, there is a difference between costs and prices received, particularly related to the amount of storage received by country elevators. To me, that is rather an outstanding cost to grain farmers and producers. As I recall, from an annual report of the wheat board itself—I think the figures are correct, and can be borne out by the annual report of 1958-59—the storage paid to country elevators—and they, themselves, store approximately three-quarters of the crop each year—amount to 11.9 per cent. To me, that seems to be quite a high percentage, insomuch as the wheat board itself pays for the wheat by borrowing the money, and pays the interest. The wheat board agrees that the country elevators receive 11.9 per cent for each year. That is not on a bushel, but on a dollar basis, for storing that wheat, and I simply would say that that is quite a percentage on an investment which, actually, you did not make. I would like some comment on that, particularly since the wheat pool itself suggested that the terms of reference were not broad enough.

Mr. GIBBINGS: Mr. Chairman, I should indicate, first of all, that the comments that are made in here are comments that were suggested by farmers themselves, as a result of the questionnaire that was submitted to them.

With reference to the cost of grain storage, it is very high. It works out to 1/30th of a cent per bushel per month, which is 12 cents per year per bushel.

Mr. GUNDLOCK: Then, you think that the wheat board's annual statement is not correct?

Mr. GIBBINGS: No; what I am saying is that you are likely quoting carrying charges and not storage charges.

Mr. GUNDLOCK: I am quoting storage charges in country elevators in each annual report, and I might state, also, that I am a pool member, a C.C.I.L. member, as well as a farmer.

The CHAIRMAN: Perhaps, Mr. Gundlock, we should delay these questions until the wheat board and the board of grain commissioners come before us. I think we are getting into another field, which probably is not too relevant to our inquiry at this time.

Mr. GIBBINGS: If I might add this, Mr. Chairman, it is the farmer's choice as to whether he stores the grain on the farm or in commercial elevators, and the farmers that belong to our organization feel that since they have returned to them whatever additional cost there is over and above the actual cost, that it is probably cheaper for them to join together and provide these facilities at the track, than to provide additional facilities on their own farms.

Mr. MANDZIUK: Mr. Chairman, I like the suggestion made by Mr. Rapp that we concentrate on the summary of recommendations.

I might say that recommendation No. 2 interests me very much. Have you, sir, any suggestions which could be embodied in our report to encourage companies to improve their facilities and staffs in order to offer more properly repaired and adequately renovated second-hand machinery? We know perfectly well the practice of the companies. Company policy is to sell new machinery. We have had dealers here who were left out in the cold in so far as second-hand machinery is concerned. The companies do not care at all about servicing this second-hand machinery, and putting it back into a saleable condition.

Mr. Gibbings, what remedy do you suggest, or what should the form of our recommendations be toward compelling the companies to do just that? I think it is a very important point.

Mr. GIBBINGS: I think, sir, in order to do this, that the size of the farm machinery dealership has to be sufficiently large that it can economically provide this type of service.

Mr. MANDZIUK: Does the C.C.I.L. provide that type of service?

Mr. GIBBINGS: The C.C.I.L., as such, to my knowledge does not, in total. The C.C.I.L. have a number of local co-operative associations, for instance, which act as their agents and are, by and large, not equipped to do this sort of thing. The C.C.I.L. depot does take the machinery in, and probably has other dealers which do some repair on it, but not in total. My own experience has been that when you live adjacent to a progressive town, where there are progressive agents, the type of second-hand equipment that you get is very much higher in quality than if you are adjacent to a small dealer. Now, I know that there are some objections to the proposal.

Mr. HORNER (*Acadia*): Are you suggesting that in some areas there is not enough competition to improve the dealerships?

Mr. GIBBINGS: I am suggesting that some dealers do not have a sufficient area to service that will allow them to do this.

Mr. MANDZIUK: They certainly do not get any assistance from the companies as far as that particular branch goes. I think your suggestion is a good one. But how can a manufacturer be compelled to give that service without hoisting up the price?

Mr. GIBBINGS: I think it will be the responsibility of the dealer. I can quite understand the attitude of machinery companies, and I quite understand their attitude on this, because the longer that second-hand machinery operates, the fewer the newer machines they are going to sell. You are speaking from the point of view of the interests of the farmer, rather than from the point of view of the interests of the machinery companies.

The CHAIRMAN: Gentlemen, we shall now adjourn to meet in this same room at 2:30 this afternoon.

AFTERNOON SITTING

FRIDAY, May 26, 1961.

The CHAIRMAN: Gentlemen, I believe we have a quorum this afternoon.

Before we proceed, I believe Mr. Phillips has a correction to make in the brief which was presented this morning.

Mr. PHILLIPS: We found a typographical error at page 51 in volume II. In the table marked 27A at the bottom of the page, the first line should read as follows: sample 774, then under the first column 16.1 per cent, in the second column 25.3 per cent, the third column 29.6 per cent, the fourth column 13.7 per cent, and in the fifth column 15.3 per cent.

Mr. SOUTHAM: Would it be too much to ask you to read that again.

Mr. PHILLIPS: At page 51 in volume II, in table 27A in the first line the figure 24.0 should be 25.3. The next is correct. The fourth figure should be 13.7 and not 15.1. The final figure is 15.3 and not 15.2.

The CHAIRMAN: Gentlemen, we will proceed with the questioning of the witnesses.

Mr. MUIR (*Lisgar*): If we turn to page 16 the brief says:

Farm size affects the farmer's demand for size and number of implements.
and then:

Farm machinery companies must also continue to recognize these developments and be ready to supply improved machinery under arrangements the changing conditions can meet.

I think there is a little discrepancy in the brief where you tell the machine companies they must meet certain changing conditions and also tell them they are bringing out too many models and model changes. I am wondering how you make these two points in the brief sort of come together.

Mr. GIBBINGS: I think it would be possible to make the changes required in the changing production pattern without as many model changes as are now taking place. I think you have experienced in your operations, as have others, that the number of model changes is increasing all the time. I recall when the model L case, for instance, stayed the same design for eight or nine years, and then LA case for a number of years, and now it seems to custom for all of the machine companies to bring out a new model much more frequently than in the past, each of them, of course, incorporating innovations; but I think they could bring out the innovations to meet changing conditions without bringing out as many changes as they do now.

Mr. MUIR (*Lisgar*): Of course the machine companies claim they are doing this in order to meet customer demand and that their production and model changes are ruled by that situation. Do you agree that the farmers are demanding more changes in their tractors.

Mr. GIBBINGS: No. I think that many of the changes, particularly the model changes are taking place as a result of the competition between companies rather than the particular needs of the farmers.

Mr. MUIR (*Lisgar*): I am inclined to agree with that statement too, sir, but in order to sell their products they must meet competition. The company which does not meet this competition is the one which will not sell the machines. I am wondering how we can put any onus on them for this when it is necessary to sell their machines.

Mr. GIBBINGS: We understand it is competition which prompts them to do it, but from the point of view of the farmer it is our belief that by doing it it is adding additional cost to the producer.

Mr. MUIR (*Lisgar*): Is there any answer to this?

Mr. GIBBINGS: Not unless the machine companies are prepared to do it on their own. I do not know that there is any legislation which could be enacted to force them to do it.

Mr. MUIR (*Lisgar*): On page 19 you bring up the matter of new and secondhand trucks. We find that many of the smaller farmers are buying secondhand trucks. Do you not think this is a natural development, because the farmer operating the smaller farm does not make the same use of his truck as would a larger farmer. The capital investment in any case in buying a new truck is too high for the use it serves. I know my own experience is that I bought a truck for \$700. That is certainly a long way from the price of a new one. I only use it about ten days of the year. If I were to spend \$3,000 on a truck certainly the expenditure would not be justified. Would you not agree that that is probably the reason so many secondhand trucks are bought?

Mr. GIBBINGS: Certainly that is one of the contributing factors. I do not think there is any question about that. Not only with trucks, but with other machines and equipment, as far as the smaller farmer is concerned, it is a question of parts.

Mr. MUIR (*Lisgar*): I think I noticed in your brief somewhere that you say that resale trucks are in better shape than the average resale machinery?

Mr. GIBBINGS: Yes.

Mr. MUIR (*Lisgar*): You account for that by saying the automobile companies and automobile agencies are better set up in regard to repairs.

Mr. GIBBINGS: Yes, this is the contention that we have in that connection.

Mr. MUIR (*Lisgar*): My last question is on standardization. The committee has been very interested in this particular phase of the questioning. We find that a lot of the machines being made and imported from other countries are such that we in Canada do not have much control over standardization of parts. Have you any suggestions as to how the committee could prevail on the manufacturers to take a serious look at this situation?

Mr. GIBBINGS: I believe the farm machinery companies are influenced by the opinion of the people who use their equipment. For instance, we think that this presentation of ours will be as valuable to the machine companies as it will be to you, because this gives actual farmers' opinions about the type of service and standardization, and so forth. If there is sufficient demand on the part of producers for this type of standardization, I think the machine companies will be influenced by it. I recognize the problems involved when machines are made in a number of countries, and are imported here, on the question of standardization. I believe, also, that there are many things that machine companies could do, if they really wanted to, in terms of standardization, even to the extent of bearings, for instance. There are many bearings now that are interchangeable between machines and automobiles, and between trucks and machines, but each company lists them separately as a separate number. Even if they were to have the same number in each of the parts catalogues for similar parts that are interchangeable, this would be of great assistance. Then, if one dealer did not have a particular part a person could go to another dealer and get it. This sort of thing would be very helpful to the purchaser.

Mr. MUIR (*Lisgar*): I believe it would. We find also in the submissions the machine companies have given us that quite often they buy their bearings, steel bearings and so on, probably from the same company. If they were to have the same number, it would be a help.

Mr. HORNER (*Acadia*): Does not the same company put the same number on the bearing?

Mr. GIBBINGS: Yes, but the machine company lists it.

Mr. HORNER (*Acadia*): If I were a farmer and said I wanted a Timken bearing, number so and so, it might require a little research on the part of the dealer, but he could determine that this would be the same thing.

Mr. MUIR (*Lisgar*): One Canadian company said they had attempted standardization but that variations were so often needed in such things as sickles, and so on, for operating in different conditions, that their statement was standardization could only be taken so far. Do you agree?

Mr. GIBBINGS: I agree it could only be taken so far, but I think it could be taken a lot further than it has been up to this point.

Mr. HORNER (*Acadia*): My first question deals with page 2. We have had before us up to now three of the largest farm implement companies operating in Canada, without a doubt—International Harvester, Massey-Ferguson and John Deere. Page 2 deals to some extent with the size and growth of the Saskatchewan wheat pool, which is a big industry and big business in western Canada. There is no denying that. I wonder if some of the things evident in the large machine companies are also evident in this large business. My first question on this line would be this. I realize this, that there may not be a direct comparison, but the machine companies before us to date have all said that over the years they are continually trying to hire more men on a salary basis rather than by the hour. They said this is so for several reasons, because of more research, because of greater stability, and so on. Could the same thing apply to the Saskatchewan wheat pool? In the head office, for instance, or in their lakehead, or ports such as Vancouver, has there been evidence that they are trying to hire more men on a salary basis rather than on an hourly basis over the years?

Mr. GIBBINGS: There has not been any great change in this. We do hire our office and country elevator staff on a monthly basis, being paid salaries monthly, as you know. Our hourly wage earners are those operating in the summer months, which is frequently not a full-time operation. You operate it during the busy months and in the winter period when the lakes are closed you do not have the same volume, so you cut the staff down.

Mr. HORNER (*Acadia*): Some of the machine companies have said what their profits are, and have related them to capital investment and to net sales. We all know that the Saskatchewan wheat pool made \$5 million, or something like that last year in profit. What percentage would this be, related to its capital investment?

Mr. GIBBINGS: We have a total capital investment of just around \$80 million. This, however, was income before taxes. I noticed that many of the machine companies list their net earnings after taxes. This figure you are quoting is before taxes.

Mr. HORNER (*Acadia*): As I understand it, the shareholders actually pay the tax on being allotted the dividends—I am a member of the Alberta wheat pool.

Mr. GIBBINGS: That is right. The dividend is considered income in the hands of the recipient, whether he receives it in cash or credit.

Mr. HORNER (*Acadia*): So actually your profits on investment would run to somewhere in the neighbourhood of 7 per cent?

Mr. GIBBINGS: Yes, on recent operations that is correct.

Mr. HORNER (*Acadia*): With regard to page 4, you quote a piece here which is sent in by a Saskatchewan farmer and it reminds me a great deal of the quote I used in a speech in the House of Commons about two years ago.

Mr. GIBBINGS: It must have been correct, sir.

Mr. HORNER (*Acadia*): In all fairness to the machine companies one must admit that there may well have been some improvements in the combine in the years from 1947 to 1960.

Mr. GIBBINGS: That is not denied.

Mr. HORNER (*Acadia*): Then you will agree with this, that perhaps the farmer is receiving a somewhat better combine in 1960 than he was in 1947. You agree with this?

Mr. GIBBINGS: Yes.

Mr. GUNDLOCK: I was surprised the other day to hear a witness who represented a machine company say that the horsepower, on similar equipment was only a very small percentage different from what it was ten years ago. I was surprised at that, actually comparing a 1939 tractor for instance, that the difference was almost negligible. I have not had time, frankly, to go through the whole brief, but I wondered if you had any research on that?

Mr. GIBBINGS: No, we have not. This could well be the case, although I sometimes wonder if the horses are the same size today as they used to be.

Mr. GUNDLOCK: They are measured the same, anyway.

Mr. CLANCY: I would like to go back to the question of standardization, and also to the testing of machinery. We have heard about standardization. Does your organization believe that if I am running a commercial truck I should get the same tax rebate as the farmer does?

Mr. GIBBINGS: This is a policy question that I think this committee would be better able to resolve than I would.

Mr. CLANCY: I just wanted an opinion. You have also talked about dealers. I quite agree with you. The small dealers have not got the facilities which the big dealer has, and the big dealer is taking over the market. Have you any suggestions? A big dealer can introduce modifications and standardization very quickly, but the small dealer cannot do that. Therefore, you are suggesting actually that the dealerships should be broken up into geographical areas or population areas and then made rigid at that so that a dealer cannot move out. You are going to give a monopoly, and you say that monopoly will be controlled as long as service is given. But who decides that he is giving service?

Mr. GIBBINGS: I would say here again that the purchaser is going to decide that. Farmers purchase equipment frequently, not so much on the basis of comparable prices as on the basis of the service he knows the dealer will give him with that piece of equipment. If it should transpire that that agency for a given company is not providing comparable service, the purchasers are going to decide which dealers will be the successful dealers. The machine companies, who are anxious to get as large a share of the available market as possible, will—as I understand they do on occasion now—ascertain that that dealer is giving proper service or they will change the dealership.

Mr. CLANCY: In other words, do you think the dual agency is the answer?

Mr. GIBBINGS: We have a multiplicity of agencies now.

Mr. CLANCY: By dual agency I mean that you are not confined to Massey or Case. If you are big enough you can take a whole bunch of them. In other words you are freezing out every other dealer within 50 miles.

Mr. GIBBINGS: I would not make that recommendation, and did not make it. If the purchaser is to have the choice that I feel he ought to have, there must be not one dealer handling all the types of equipment, but several dealers handling the different makes.

Mr. CLANCY: It has been proven that the dual agency is most efficient, giving his customer satisfactory and guaranteed service.

Mr. GIBBINGS: If he is giving guaranteed service, that is a different factor. I am not sure you can guarantee service on that basis. If you say he can, I am prepared to accept it.

Mr. CLANCY: I cannot say it is general. I know of instances where it is done.

Mr. FORBES: Do your employees of the Saskatchewan wheat pool elevators belong to unions? If they do, is it your opinion that the fact of union membership increases the cost of your operations?

Mr. GIBBINGS: Yes, our employees are unionized. We have a great number of unions. The country elevator staff in head office and in the country formed their own association, to start with, called the Saskatchewan wheat pool employees' association. They have now become affiliated with the Canadian Labour Congress. I believe we pay higher wages on the average than our competitors pay. This is not due particularly to the union, but due to the fact that on the average I think we have a larger volume of grain through our elevators than our competitors have, so we reward them on the basis largely of the work they are doing. The result is that our wages are higher. I am not prepared to say that our wages are higher because of the fact that the association was formed.

Mr. FORBES: Since your employees have become members of the union, have the salaries been increased?

Mr. GIBBINGS: No, we have not negotiated any salary agreements since they affiliated with C.L.C.

Mr. HORNER (*Acadia*): Your wages definitely vary on the high side. If the receipts for grain are high, he will be paid more than if they are low?

Mr. GIBBINGS: We operate on the basis of a minimum salary, with an accelerated crop basis.

The CHAIRMAN: May I remind the committee that we are investigating the price of farm machinery, not the internal operations of the Saskatchewan wheat growers.

Mr. FORBES: Yes, but we must bear in mind that the machine companies appeared before us and pointed out on more than one occasion that the cost of labour has increased. This is the question I am trying to determine from sources other than the machine companies.

Mr. GIBBINGS: The cost of labour has increased. There is no doubt about that.

Mr. FORBES: In your summary of recommendations, in number five, you go on to say:

That the federal government review legislation and practices affecting the operation of farm improvement loans to assure their fullest use by ordinary farmers, that it have amended the Farm Improvement Loan Act's terms to improve loans for the purchase of new and second-hand farm machinery and that it extend the Farm Improvement Loan Act's facilities to credit unions on terms similar to those now provided for the chartered banks;

I was studying the other day the recommendations of the royal commission on agriculture and rural life. In page 10 of the summary pamphlet, I find this:

There is evidence that the ease with which F.I.L.A. loans can be secured and the removal of financial responsibility from the implement dealer have resulted in some overmechanization in terms of the land resources of smaller farmers.

How do you correlate these two opinions?

Mr. GIBBINGS: It could well be that some farmers are overcapitalized in machinery and, as a result of having credit facilities available to them, it may be one of the contributing factors. At the same time, there may not be sufficient credit available, so that every farmer can have all of the equipment that he should have; or, he may be receiving the credit requirements through the F.I.L.A. I understand that the aggregate moneys available through F.I.L.A. have been increased within recent dates. This would seem to indicate that the demand exceeded the total amount available. That could happen. At the same time, you could have some people overcapitalized. I think that you will also find in that submission, if my memory serves me aright, that the suggestion was made that perhaps the banks ought to train their managers so that they would be in a better position to give sound managerial advice to the applicant.

Mr. GUNDLOCK: I hope they do not get any tougher.

Mr. GIBBINGS: The banks tell me, in discussing this question with them, that in areas served by more banks than one, if one bank attempts to give this type of advice, to suggest to the farmer that perhaps the combine he intends to purchase is beyond the size required for his operations, and refuses the loan on this basis, or asks him to negotiate for a smaller loan—then, if there is a competitive bank, the farmer goes to it and gets the loan. Therefore, the restraint some managers would like to put on the purchaser is bound up with the competitive position, which makes it impossible for him to do that and still make the loan.

Mr. FORBES: You extend that in your recommendations here and say you would extend the F.I.L.A. facilities to credit unions on terms similar to those now obtainable through hire-purchase. I presume you are quite familiar with the operations of credit unions, that you are well aware of the rates of interest and how they apply those rates. Is it your opinion that there is any way this action could be correlated to the credit unions? They do not loan money at five per cent to start with.

Mr. GIBBINGS: No. If they had the guarantee against loss that the Farm Improvement Loans Act provides they might. My understanding of the problem, as it exists with respect to the type of supervision that is given to credit unions, is that they are set up under provincial legislation which makes it impossible for the terms of the Farm Improvement Loans Act to be applicable to the credit unions. There are some structural changes which would have to take place in the credit unions themselves, or in the Farm Improvement Loans Act, to make it applicable.

Mr. FORBES: If you know any way in which that can be done, I wish you would enlarge on it. There was a bill just a short time ago on this subject. I do not think too many members were posted on how this could be done under the Credit Union Act.

Mr. GIBBINGS: I think it could be done if the farm union loan sponsors were prepared to take the chance without the degree of jurisdiction over the credit unions which is exercised over banks. If the opinion is it would not be expedient to provide the type of credit which is provided under the Farm

Improvement Loans Act without changes being made in the Farm Improvement Loans Act, then I think this ought to be stated and perhaps the necessary changes in the structure of the credit unions could be made. This does not apply only to farm improvement loans, but also to other government guaranteed loans, and excludes credit unions.

Mr. FORBES: I do not think banks restrict loans because they are short of funds, I think it is strictly on the ability of the farmer to repay. I do not see that there is any particular need to extend it to the credit unions.

Mr. GIBBINGS: There was a period a few years ago when the banks, according to them, were short of funds and restricted from improvement loans.

Mr. HORNER (*Acadia*): That was in August of 1959. As I understand it credit unions loan money at from eight to twelve per cent, which varies from one union to another. If I am wrong in that please correct me.

Mr. GIBBINGS: They have various interest rates.

Mr. HORNER (*Acadia*): Under the Farm Improvement Loans Act loans are made at five per cent. If I, for example, was a credit union and had money I could loan at eight to twelve per cent I would not be anxious to come under any provisions which would require that I loan money at five per cent. I remember the Minister of Finance, under some particular piece of legislation when this question was raised, saying that we have had no requests from the credit unions themselves to become lenders under this low rate of interest. I think this is the point. Have you had any definite requests from credit unions who want to come under these farm improvement loan regulations?

Mr. GIBBINGS: The larger ones, yes. The interest rates you referred to usually cover the insurance on the loan. It is included in the interest rate. I understand that this works out at about 1.3 per cent, or something in that order. The larger unions frequently have excess capital available. They deposit it usually in the cooperative credit society, certainly so far as Saskatchewan is concerned. The cooperative credit society, for instance, loans money to us at rates which would be no higher than the farm improvement loans. Therefore there is cooperative money available which could go into this type of loan under certain circumstances, one being I would say the guarantee. I recognize, as you do, that all credit unions do not have excess funds.

Mr. HORNER (*Acadia*): You suggested that if the credit unions had this guarantee they might be favourable to making loans at five per cent. Are the credit unions' losses high?

Mr. GIBBINGS: No.

Mr. HORNER (*Acadia*): Then why is the guarantee necessary? I believe it is only one-tenth of one per cent of the aggregate amount.

Mr. GIBBINGS: If I was a lender I would be influenced by this type of guarantee.

Mr. HORNER (*Acadia*): It seems relatively small.

Mr. GIBBINGS: Frequently it would be 100 per cent of the loss.

Mr. HORNER (*Acadia*): Say that the aggregate amount of the loan was \$1000 and the government guarantee is one-tenth of one per cent—here it is at page 4 of the annual report of the farm improvement loans board.

Mr. GIBBINGS: It is on the aggregate loans.

Mr. FORBES: I think this is very important in connection with machinery. We have had machine companies before us who have said that they have their own lending branch and that the cost of a loan to the farmer is as high as eleven per cent. If they could get loans at around five per cent interest it would make quite a difference in the total cost of the farm machinery.

Mr. TARDIF: Is that eleven per cent per annum on the full amount?

Mr. FORBES: Yes.

Mr. SOUTHAM: We have had a lot of discussion about farm credit and the systems we have. I would like to ask if in your opinion the maximum of \$7,500 which is now provided under the Farm Improvement Loans Act is enough to meet the varying changes in respect of the larger economic farm unit. Or, on the other hand, should the government take a look at it to see whether it should be larger? Have you any opinions as to whether or not this is adequate?

Mr. GIBBINGS: My understanding is that the maximum has been increased recently.

Mr. SOUTHAM: It was increased from \$5,000 to \$7,500. Does that appear adequate in view of the expanding economy of the farmer?

Mr. GIBBINGS: In the light of the increasing cost of farm machinery and equipment, and the other uses to which farm improvement loans may be applicable, my belief is that the maximum ought to be increased perhaps to \$10,000.

Mr. MUIR (*Lisgar*): I believe you have found from your questionnaire that the average amount of money invested in farm machinery is around \$9,000.

Mr. GIBBINGS: No. That was the figure in respect of the farm management clubs which are being operated.

Mr. MUIR (*Lisgar*): That is among the better farms.

Mr. GIBBINGS: Yes.

Mr. MUIR (*Lisgar*): Do you think that \$7,500 is a pretty good proportion of the \$9,000 invested?

Mr. GIBBINGS: Yes, for farm machinery; but there are other uses to which the farm improvement loans may be put.

Mr. SOUTHAM: Mr. Chairman, I would like to take this opportunity of congratulating Mr. Gibbings and his officials on this brief. It is based primarily on a questionnaire sent out to 887 farmers. I think this is very important, because when we set up the terms of reference and instituted this committee we were concerned about having a cross section of opinion from the farmers. In this brief we have the considered opinion of approximately nine or ten per cent of the farmers in Saskatchewan, which is one of the top farming areas in Canada.

I am interested in several of the statistics which were arrived at from this questionnaire. One is the fact that some of the better farmers, because of their technological training, were most critical of the type and quality of machinery they were getting. Having this technological know-how they were better qualified to form this opinion. This brings me to the previous discussion we have had about the quality of the farm machinery and the testing of it. I notice in the eight recommendations here there is no recommendation made as to whether or not there should be an improvement in the testing facilities. For instance, similar to those we have in Saskatchewan. There is no suggestion as to whether or not these should be enlarged, or whether we should encourage federal aid in order to have a national set-up. What would be your suggestion along that line?

Mr. GIBBINGS: I would say that it is desirable to have as much testing as possible in the areas where the machine is going to be used. I recognize, as you do, that there is a great variation in conditions even in one province. I would say that perhaps it would be desirable to expand this on a provincial basis, and have one of them in each area.

One of the complaints we detected in the questionnaire and also I think which has been mentioned previously in your deliberations is that machines are

made to service a wide variety of agricultural conditions over a wide area. Even with the amount of testing which the farm implement companies do it becomes difficult, before a machine is put on the market, to have it tested under all these conditions. I am sure that the companies are as anxious as anyone else to put out a machine which will do the job under all conditions. I think the more testing that is done the better machines the farmers will have. I also believe that in the end this will benefit the manufacturers.

Mr. SOUTHAM: We have had evidence to the effect that there is a suspicion of clandestine practice in the farm machinery industry, as well as others. We also have had accusations to the effect that the farm machine companies are putting on superfluous gadgets which are not necessary. I am wondering if it is in this area that we could recommend a wider distribution of this testing so that the people in checking the machines could determine if there is planned obsolescence and perhaps make recommendations. The companies are trying to vie with one another all the time with regard to putting out more models and personally I think there are weaknesses here which might be checked.

Mr. GIBBINGS: I agree with that. I believe this matter of planned obsolescence does exist. It as reflected itself in the multiplicity of model changes. In reference to the pamphlet from which Mr. Forbes was quoting earlier, at that time there were 75 models of tractors in the province of Saskatchewan available to the producers. This is a terrific number, when you think of the homogeneity of the production pattern in our provinces. It seems to me that the cost of carrying that number of models and the cost of carrying the repairs, along with the servicing cost, is ultimately an important factor in the price. The question of how you can regulate that with the dealership competition which exists between the companies is a different proposition.

Mr. SOUTHAM: We have had quite a discussion in respect of the enlarging of agencies so that they could accommodate the farmers by giving better service and maintenance of machines. Do you think, with regard to the establishment of these, that we have reached the saturation point, or should we go further? We spoke about the fifty miles a farmer is willing to drive to get service.

Mr. GIBBINGS: I know this is not a popular suggestion to make with reference to the dealer, but we are thinking in terms of the producer. My feeling is that the producer would be serviced better if there were still further consolidations of machinery agencies and repair depots. I think it is interesting in our questionnaire that the farmers did not complain about having to go a fair distance for repairs and parts. Their complaint was in respect of the inability to get them. This is due to two factors. The first is that the agency may not have the part. The other complaint was that frequently the nearest agency was not open when they got there. These seem to be the two areas of complaint, not the fact that they had to go a good distance.

Mr. HORNER (*Acadia*): The implement dealers presented tables with respect to the dealers and the areas. I was particularly interested in one table because it set out the average radius for the different provinces of Canada. In Saskatchewan the average radius of trading area was 24.3 miles, the largest of any province in Canada. Would you say that is approximately right?

Mr. GIBBINGS: I would not know the distance in other provinces, but I am sure the figures are approximately correct in respect of Saskatchewan.

Mr. HORNER (*Acadia*): Would you say that the 24.3 miles would be approximately right?

Mr. GIBBINGS: Yes.

Mr. HORNER (*Acadia*): And that this might even increase?

Mr. GIBBINGS: It might.

Mr. GUNDLOCK: My questions are along another line. I would like to go back to the question about horsepower. I think you said you thought they might use different methods of testing.

Mr. GIBBINGS: That was a facetious statement. I did not really mean they had changed their standards of testing. I do think, however, that many tractors are overpowered for the type of equipment the farmers tie on behind them.

Mr. GUNDLOCK: Overpowered?

Mr. GIBBINGS: Yes.

Mr. GUNDLOCK: They claim that the price today per horsepower is a very small percentage above what it was, I think they said, ten or twelve years ago. That is rather a surprising statement.

Mr. GIBBINGS: It is. I must say that we have made no calculation that related cost to horsepower. The calculation they made undoubtedly is a correct one.

Mr. KORCHINSKI: Rather than follow the pattern which has been established here earlier, I am going to be a little critical of Mr. Gibbings in his submission, because of the fact that on page 56 of your volume 2, you report that the majority of farmers who cited suggestions or complaints said that the prices of farm machinery and parts were too high.

Mr. GIBBINGS: Yes.

Mr. KORCHINSKI: Now, I think that your organization is as vitally concerned about the price of machinery as we are here. It is our duty to sit here and to try and figure this out in some way or other. I see nothing in your submission, sir, to give us any indication as to how we can accomplish these things. I think this is one of the biggest complaints. You have 887 farmers citing these suggestions from 16 different districts. Now, one of the biggest problems is this. I look through your recommendations and I find that you make suggestions, like perhaps, that evening and weekend services for farmers should be provided. However, I think you will agree with me that if this is provided, it will cost extra money in the end, and as a result, the farmer will have to pay more money for his machinery if he wants to keep that machine agent in business, and so on.

And, what else do I find? I find another suggestion here that the farmers should support to a greater extent the operation of C.C.I.L. I have brought this up before, and I would like to hear your comments on it. If that should be the answer, why have we not, as farmers, supported Co-operative Implements Limited more than we have? As I have mentioned here, I have gone, on several other occasions, from one dealer to another in an endeavour to find out where I can buy a certain piece of equipment cheaper, and if I am unable to buy it at a better price, I wonder why they have not been able to arrange that for me.

Another thing you suggested is that perhaps there should be more mechanical service, and that sort of thing. Again, that, to me, suggests that it is going to cost more money to have these services.

Everything in your brief, other than standardization, would suggest more money. Now, I know you are concerned about that, as we are, as your organization has demonstrated this on several occasions.

If I may say so, you have not any specific recommendations, and if so, how are we supposed to come up with some solution, without your assistance?

Another suggestion of yours, which is set out at page 56, is that the dealer should stock parts for longer periods of time. Again, if that is done, it will cost extra money.

Recommendation 3 is in connection with standardization, and this is one of the recommendations with which I agree.

I would like to have your comments on all these things I have said, before I proceed.

Mr. GIBBINGS: Mr. Korchinski, your point is well taken. When we considered the type of submission that we should make, we consciously chose this type of presentation because we felt it would round out the type of evidence which you were getting, and that if we went directly to the producers and obtained their opinions and made comments on them, this would give you the type of information that was not obtainable easily otherwise.

We said at the outset that the farmers felt that the price of machinery was too high. We stated that on a number of occasions, and then proceeded to say, in our submission, that we proposed to deal with some of the other aspects of mechanization in terms of availability of repair parts and supplies, the type of service, the amount of money that the purchaser was spending on machinery, and so on. We did this consciously as we believed that it would round out the total picture. We were convinced, and subsequent advice has proven us to be right. You have had people here and, no doubt, will be bringing more witnesses who will be much more competent to deal with the question of distribution costs, the question of manufacturing costs, and so forth, than we would be. We do not have the facilities available to us which would be available to some of your other witnesses.

It is true that we have made some comments here which may, on the surface, appear as if it is going to cost the producer more money. However, it is a question of whether it is going to cost him more money to have this type of service, or whether it is going to cost him more money by being without the use of a certain piece of equipment which has broken down. I think you will recognize that there was, at least, some 30 per cent of the farmers who said that they lost the use of their equipment from two to seven days during the year. This cost to the farmer, through breakdown of equipment at a vital time of the year, such as during the harvesting or seeding season, would prove very costly to the producer. It is a question of attempting to balance them. We suggested, in so far as farm machinery is concerned, that by reducing the number of models and standardizing the components and repair parts, as well as eliminating unproductive machinery features, and consolidating their service, this would, in the end, result in better and cheaper service to the producer.

I do not want to go through the balance of these which indicate those particular recommendations which, we believe, would reduce the ultimate cost to the producer or, conversely, improve the service. This is what these recommendations were designed to do, and I think, by and large, they do just that.

There was a multitude of other recommendations which we might have made; however, we felt that the ones we did make flowed out of the opinions which were expressed by the producers through our questionnaire.

Mr. KORCHINSKI: Mr. Gibbings, am I supposed to deduce from what you said that the farmer is not complaining about the cost of farm machinery, but that he is more concerned about having it serviced, and that the cost is not a factor at a certain time of the year.

Mr. GIBBINGS: I am saying that we said categorically here that a large percentage of the farmers said that farm machinery costs initially, as well as farm machinery repairs, were too high. However, I think you will admit that there is a balance as to the additional cost involved in the farmer's operation, if the machine is broken down, as against the additional distance he might have to go for a repair part, or supplies. This is the point I was making.

Mr. KORCHINSKI: I know I would not want to tie up a \$7,000 machine, if I needed only a \$5 part. I would like to keep that machine working. Am I correct in my assumption that they are not concerned with a certain time of the year, say harvesting or seeding. Is that not one of the factors to be considered at that time?

Mr. GIBBINGS: Are you referring to the cost?

Mr. KORCHINSKI: Yes.

Mr. GIBBINGS: Yes, quite.

Mr. KORCHINSKI: It is a factor, but it is not their primary concern. Then, you say you should centralize. If you are going to centralize, that is going to mean that some of these areas that are presently serviced by a dealer will not be in existence, and that you will have to go further. I know what my attitude would be in this regard, and I would like to have yours on the record. You have stressed centralization here.

Mr. GIBBINGS: Yes. The key word there is "service". If the dealer is, in fact, able to provide service nearby, this will meet the requirements of the producer. However, the producer was complaining, in this questionnaire, that he was not getting service from a great number of the dealers, and we suggested that perhaps centralization would give the dealer sufficient volume so that he could provide the type of service the farmer was demanding.

Mr. KORCHINSKI: You are, no doubt, familiar with our area of Mackenzie, and Yorkton. Some of the machine companies have pulled their operations out of there, and we have had to deal through Regina, Winnipeg, and other places. The train service, as well as other types of transportation, has been such that on several occasions they have not been able to meet our demands. I cannot see how centralization has helped us to service our machines better than they were before. There have been occasions when we have had to hold up for another day, whereas, if I could have whipped into Yorkton, I could have received the proper service and been on my way. I am unable to see how centralization is going to improve our operations.

Mr. GIBBINGS: I am not sure that we are talking about the same thing.

Mr. KORCHINSKI: You are speaking of dealerships?

Mr. GIBBINGS: Yes, and you are speaking of warehouse and distribution facilities, rather than dealerships, in so far as Yorkton is concerned.

Mr. KORCHINSKI: Yes.

Mr. GIBBINGS: You were in a preferred position there, in that you did have warehouses and the ones who were servicing could go direct to these warehouses and get the necessary parts.

Mr. HORNER (*Acadia*): First of all I would like to clear up any misunderstanding I may have created in my statement concerning farm improvement loans. I find on page six of their annual report for 1960 that the government guarantees 10 per cent. That would be the accurate amount; and that the loss ratio under the Farm Improvement Loans Act, has been one-tenth of one per cent. Now, may I proceed. You said that you thought this \$7,500 should be increased to \$10,000; and you also stated in your brief that the average amount of investment in farm implements has been about \$9,000. I notice that in the 1960 annual report on page four they say that the average size of loans has been increased progressively from \$784 in 1945, to \$1,497 in 1960, so that the average loan is not too high according to this. This is on farm implements, and they go on to say that in 1960 there were 28,774 borrowers who had not previously obtained farm improvement loans, and that these accounted for 42 per cent of the total number of loans made. So I suggest that this points out that a great

many borrowers are continuing to borrow, and not for the first time, under the Farm Improvement Loans Act, and that their borrowing, as you can readily judge from the average size of the loan, is not too high.

In the light of these facts do you still think—and I ask this in all seriousness, because I am here to try to promote better conditions for the farmers at every turn—do you still think that by increasing the farm improvement loan to \$10,000 you will actually be helping the farmers to any extent particularly the small farmer who may not have had a chance to borrow before, or someone who may be borrowing for the first time?

Mr. GIBBINGS: I would not want anything I say to be interpreted as being critical of the Farm Improvement Loans Act. I think this has been a remarkable piece of legislation, which has been of great assistance to the producers. I recognize that there would be a limited number of producers who would want to have the maximum loan under the Farm Improvement Loans Act, and that any advance beyond \$7,500 maximum at the present time, would assist the small producer as you suggest.

Mr. HORNER (*Acadia*): That is fine. Thank you a lot. And now to follow it up a little further: you suggest in your brief that, relatively speaking, the farmer with some experience in business has an awful lot on equipment. I do not know the exact page, but perhaps I could find it. You suggest in your brief that the farmer who has had quite a few years of experience in farming—I think you use 40 years—is pretty well stocked, generally speaking, with farm equipment, so he does not need to do very much borrowing. He may, more or less, sit tight. So it is not that particular farmer we want to help by increasing the amount which could be borrowed. It is the small farmer, the little guy who is doing all the borrowing, that we want to help. You stated that you do not really think that a \$10,000 increase would help this particular small type of farmer.

Mr. GIBBINGS: It all depends on the uses to which he was attempting to put the money. If it was an attempt to equip himself from the beginning, for instance, I think you would agree that the maximum of \$7,500 would not be any more than what he would require even for machinery. But if he wanted to utilize the provisions of the Farm Improvement Loans Act for other uses to which it may put, it is quite conceivable that his need may be beyond \$7,500, even though he may be a large farmer, or one who had been in operation for a considerable period of time.

Mr. SOUTHAM: I am quite interested in this farm credit question. It brings me to the thought of the farm credit corporation. You realize we have looked into this. In itself it is trying to assist the farm economy. I was wondering if in the survey you made you got any replies back, or any comment from any of them—I did not see any note of it in your submission—as to how it was working out? You say there was a spread between 21 to 45 which came under part three of this act. I was interested in your comment a moment ago when you said you thought that certain banks vied with one another for these loans to farmers, and that they were a little reluctant to give the farmer the advice that he should have. This farm credit corporation sets out the help which they extend in that particular aspect. Did you have any comment on it from the cross-section of the 887 questionnaires which you sent out?

Mr. GIBBINGS: No. Mr. Phillips tells me no. I believe that the act to which you referred is serving an extremely useful service, and that an amendment or consolidation of the amount which has been incorporated in it could be a very useful adjustment. This is particularly true, and I am glad to see the supervision that could be given to loans under certain circumstances.

Mr. SOUTHAM: That is an aspect of it in which I am very much interested.

Mr. FORBES: On page 16 you say that government policies must continue to recognize these developments and adjustments and must continue to help the farmers rather than hinder them. In what aspects have we been hindering farmers by any government agency?

Mr. GIBBINGS: My observation is that we suggest you should continue to help them rather than to hinder them. We simply throw out the suggestion there.

Mr. FORBES: I thought you meant that we had hindered them.

The CHAIRMAN: Are there any further questions?

Mr. HORNER (*Acadia*): I would like to point out that in the 1960 year of the Farm Improvement Loans Act—and this is relevant to the brief—it is stated in the brief that the young farmer starting out was buying mostly second-hand equipment. In the 1960 year, farmers purchasing second-hand equipment borrowed on tractors to the average amount of \$1,000 per tractor, and a little less than \$1,000 on trucks, and a little over \$1,000 on combines. This is a rough summary of what you have borrowed, and the uses made of it. So for the second-hand tractors you suggest they are paying \$7,500, and I am suggesting that it is just enough, or probably just enough to meet most of their average needs.

I have a further question on page 15 which interests me to quite an extent. Let me put it this way: you say near the bottom of page 15 that most of the farmers live on their land all year round and few of them, or their wives, have off-farm jobs. I wonder if you have a percentage as to how many? If you do not have a percentage, I wonder if you would be good enough to comment as to whether or not you think at one time—I might say I was born and grew up in Saskatchewan—that at one time a lot of people in Saskatchewan were leaving the farms and living in towns, and doing their farming from towns. It is implied that this trend is perhaps being reversed, and that more people are moving towards the farms.

Mr. GIBBINGS: This was the situation that actually existed among the sample of farmers that we surveyed. And perhaps in this regard they may not be representative of the total. We suggested the secretaries of our committees may have consciously been chosen because they were living in the district the year around. Any comments I might make with respect to the latter part of your question would be pure speculation. But my observations are that there is certainly a declining trend to village and city living on the part of farmers. And in some instances that I know of, there is a bit of a reverse trend, partly due to the diversification of agricultural production, in that many grain farmers who have been exclusively in grain and who lived in towns and villages during the wintertime, are now moving back to the farm and feeding some livestock on the farm. In addition to that, the improvement in transportation facilities has resulted in a lesser degree of isolation, and a greater opportunity to provide educational facilities for their children, than was the case a few years back. These factors, I think, in combination, have slowed down the movement towards the towns, and in some cases have reversed it.

Mr. HORNER (*Acadia*): This agrees with my own opinion. I have thought that this trend is perhaps reversed to some extent, and I am glad you verify it. Now, to ask you one more question, on page 19, you suggest that the larger farmers also report more tractors in total. You suggest that this is because of their ability to purchase. Would it not be because of their need to do so? I mean that a large farmer will need more tractors and maybe better equipment, because he has more money in standing stock, and if he does not get that crop off, he will have a lot of debts hanging over his head.

Mr. GIBBINGS: Yes. If it resulted in anything less than this, I think you and I both would be very surprised.

Mr. HORNER (*Acadia*): Yes.

Mr. KNOWLES: I have one question on page 21 where you say that on the whole mixed farmers seem to have a higher machinery inventory than the purely grain farmers. I was rather interested in that, because I come from Ontario, from an area where they do quite a bit of specialization as well. We have noted, too, that a person may specialize in one crop and have one type of machinery, while some other farmers would have a fuller line. I notice you say that of the few with more than \$30,000 in machinery inventory, most are grain farmers. Would that be because they are very large operators?

Mr. GIBBINGS: Yes, this would be the larger sample.

Mr. KNOWLES: I was wondering if there was a limit in there somewhere, where the thing changed according to the size of the operation.

Mr. GIBBINGS: At the bottom of page 21, in table 12, it is pointed out in the investment per farm for grain, livestock, and mixed—you will notice in the \$30,000 value class that 4.1 per cent of the grain farmers had that classification as compared to 1.58 of the mixed farmers.

Mr. KNOWLES: I know from reading, and from talking with people from western Canada that you are diversifying, and that your farming as compared to earlier years is becoming more mixed. The cost of machinery would have to be regulated, but you cannot do that. However, would you not be better off if you specialized in a certain line, rather than to try to undertake many different operations?

Mr. GIBBINGS: Yes, I think this is what is transpiring as well. But rather than have a single enterprise, they chose to have one enterprise plus one other major supplementary enterprise, that is, rather than having a great multitude of small enterprises, they are concentrating on one, two, or three major enterprises.

Mr. SLOGAN: Mr. Chairman, I would like to go back to the point raised by Mr. Korchinski concerning the C.C.I.L. on page 57, where the statement is made as follows:

C.C.I.L. has proven that it can market suitable and adequate farm machinery at prices below the average for the credit and corporate machinery companies and it has also shown that it has facilities to claim a larger share of the market from one year to the next.

My question is on page one where the Saskatchewan wheat pool states that they represent not only the 7,500 members patrons, but also the entire Saskatchewan farming community which is now estimated to number about 97,000 farmers. I am all in favour of the C.C.I.L., and I think that they probably believe a lot of these problems could be corrected. But what I cannot quite understand, and I would like to have your view on, is how, when the C.C.I.L. is asking for it, and when the national farmers union, and the Saskatchewan government said that they would be willing to assist them financially, and with their organization which is a very powerful and influential one—that in spite of this they have only been able to capture 2.7 per cent of the market for farm machinery in western Canada. What is wrong? Is it that you do not have influence, or is it that the C.C.I.L. has not met the needs of the farmer?

Mr. GIBBINGS: The manner in which savings have been demonstrably possible has come about as a result of a reduction in distributing costs as well as sales costs, particularly. Farmers are peculiar individuals, in that they buy voluntarily almost everything except machinery. They have to be sold machinery, it would seem. I think this is one of the contributing factors. And I believe, in reference to your suggestion, that in spite of the fact that all these

organizations are giving support to the C.C.I.L. on an official basis, that I would be the first to admit that in so far as our own organization is concerned, we have not been as helpful and as effective as we might have been at the local level in supporting the C.C.I.L. In other words, we have not done a lot of promotion at the local level. I believe this is one of the contributing factors. When I was on the farm operating it myself, I had a large percentage of my equipment in the form of C.C.I.L. equipment. It was very satisfactory in terms of service and by that I mean in terms of service received from C.C.I.L.

This is one of the great mysteries to me, as to why, when they can demonstrate that there are savings to be effected, and that there are larger savings to be made than was the case in the past, that if producers could utilize the C.C.I.L. to set up for themselves, why they do not do it. This is a complete mystery to me. I just do not understand it. I think the cause has been lack of promotion, in that we have not promoted it in our voluntary organizations, and that therefore they lack the direct contact; I refer to C.C.I.L. as compared to many of the other companies.

Mr. SLOGAN: Do you think that we, in the government, can regulate farmers and regulate farm machinery to the point where we can improve the situation drastically? When the national farmers union were here we heard from one of the farm union representatives, who said that he had three or four different types of machinery on his farm, none of which were C.C.I.L. machines. It seems to me that when you have a farmer within this organization which represents farmers, and he is not willing to face the responsibility, do you think that the government can force him to do so, or regulate it to the point where this situation can be drastically changed?

Mr. GIBBINGS: No. This recommendation was directed to the farmers themselves. We suggested specifically that the farmers, by themselves, support to a greater extent the operation of the C.C.I.L. and so on. We did this in the hope that some additional publicity might be directed to the farmers at this particular time. In other words, this was the method which was employed. We did not expect that the government could take action.

Mr. SLOGAN: The other point I would like to bring up again is that there is a similar co-op in the province of Quebec. You have probably read about it. It has captured 30 per cent of the market for farm machinery in the province of Quebec. Obviously the prices they are selling at are not below what the farmer can get his machinery for from private sources, or he would be buying it from them. Do you think that your organization, and other farm organizations would be willing to sit down with the C.C.I.L. and perhaps change their whole concept to the extent of what the farmers demonstrate that they will support?

Mr. GIBBINGS: The C.C.I.L. have a policy, as all cooperatives have. It is one which says that they will sell at a competitive price, and that any overcharge will be returned in the form of a patronage dividend. This obviously involves the slogan of an immediate benefit to the producer, in that at the end he will be getting a patronage dividend. There is a wide difference between the co-operative federation in the province of Quebec and the C.C.I.L., in that the Quebec co-operative, as I understand it, have the sole distributor rights for one line of equipment in that province, and there are no competitive dealers selling that particular brand of equipment in the province of Quebec. But in the area serviced by the C.C.I.L., according to the contract which they have with the Cockshutt company, as I understand it, it prohibits the C.C.I.L. from establishing agencies in areas which are currently being served by an agent for Cockshutt. So that the same equipment which is purchased and resold by C.C.I.L. from Cockshutt is already being sold by a large number of agents for

Cockshutt, who are directly competitive with C.C.I.L. I think that is one of the contributing factors to the difference in the volume of the market that C.C.I.L. has been able to capture as compared to the Quebec co-operative.

Mr. SLOGAN: Apparently the Quebec cooperative provides very good service as well as private schools for the dealers, and it appears that it is not just the lower price and the exclusive dealer establishment which makes a difference, but rather the superior service which it provides. Would you think that perhaps the C.C.I.L. could give the farmer superior service as compared to the private dealer, or could it give just as good service?

Mr. GIBBINGS: Well, my experience would not be a fair sample, because I am reasonably close to one of the C.C.I.L. agencies. I have no complaints of the service that I get, or of the availability with respect to spare parts and supplies. But this might not be general. I would not want to make a judgment on it.

Mr. KORCHINSKI: Since you advocate the use of C.C.I.L. facilities, and since one of your recommendations is for the standardization of models and so on, can you give me one example where the C.C.I.L. has done that with their machines?

Mr. GIBBINGS: Yes. I think that since the C.C.I.L. began to manufacture, sell, and distribute discers that they have had two models over that entire period. Mind you, they made some minor adjustments on the models that they did have; but this is one instance where they were bringing out different models.

Mr. KORCHINSKI: How many years ago was this?

Mr. GIBBINGS: If I remember correctly I bought my first C.C.I.L. discer in 1948, and I believe it was about 1955 or 1956 when they changed the model of their discer. I have that same model now.

Mr. KORCHINSKI: What were the changes? Was it a bearing in this case?

Mr. GIBBINGS: They changed the bearings, they changed the design, and they changed the feed box to a larger feed box. It was quite a major change when they did make it.

Mr. KORCHINSKI: But that was a change; it involved a newer type of bearing.

Mr. GIBBINGS: Yes.

Mr. KORCHINSKI: And this was a change which was effected because of what other companies had done. You almost would have to fall in line with the rest of the changes in order to compete with the others.

Mr. GIBBINGS: I think this would be right. I do not know whether or not all companies did it.

Mr. KORCHINSKI: But, if the other companies had not come out with these changes, we still may have been using the older type of bearing.

Mr. GIBBINGS: This is a possibility. However, I would not want to say so categorically. It would be an opinion.

Mr. KORCHINSKI: I have another question, but it concerns another subject.

Mr. SLOGAN: I have a supplementary question.

Mr. HORNER (*Acadia*): So do I.

Mr. SLOGAN: Do you think that it would be possible for C.C.I.L. to acquire an exclusive dealership for Cockshutt equipment in the province of Saskatchewan?

Mr. GIBBINGS: They have not been successful in negotiating that type of contract.

Mr. HORNER (*Acadia*): I have a supplementary question. You suggested, in answer to a question by Mr. Slogan, that perhaps the C.C.I.L. was not close enough to the farmers. Were not the wheat pool agents at one time also agents for C.C.I.L.?

Mr. GIBBINGS: I believe some of them were at some time agents for the portion which was manufactured by C.C.I.L. at the Elmwood plant, for a short period.

Mr. HORNER (*Acadia*): But this did not prove successful?

Mr. GIBBINGS: No, it did not. Our agents are buyers and not sellers.

Mr. HORNER (*Acadia*): Could I ask one more supplementary question. Do you think C.C.I.L. should manufacture a full line of its own equipment?

Mr. GIBBINGS: I think it would be desirable, although I think you do realize, as well, that it is a pretty competitive field and would require a great deal of capital which C.C.I.L. at the moment does not have.

Mr. HORNER (*Acadia*): But it has backers.

Mr. GIBBINGS: It is true that it has backing, but, when you start talking in millions, which this would involve, it is a different situation.

Mr. HORNER (*Acadia*): I do not know how many millions would be involved, but I know that the Saskatchewan government said in an earlier brief, that C.C.I.L. has standing offer with them, and that at any time they want to borrow money, they can go to them.

The CHAIRMAN: Have you a question, Mr. Muir?

Mr. MUIR (*Lisgar*): Mr. Chairman, my questions concern the same section, namely, recommendation No. 8, which says that farmers by themselves support to a greater extent the operation of Canadian Co-operative Implements Limited, the farmers own machinery manufacturing and distribution co-operative. I notice that this recommendation is taken from the answers of 34 sample farmers out of 887. Would you not think that that is a small proportion of the farmers upon which to make that recommendation?

Mr. GIBBINGS: Well, it is a higher proportion than are now using C.C.I.L.

Mr. MUIR (*Lisgar*): Well, then, I have a supplementary question to that, and you may have answered this question before. Is one of the reasons that C.C.I.L. is not selling machinery due to the fact that they are not giving the service?

Mr. GIBBINGS: I think the reason is more that they do not have the same battery of salesmen on the road.

Mr. HORNER (*Acadia*): In other words, they should have a bigger and better distribution system.

Mr. GIBBINGS: If they had that, I think many of the savings that could be effected would be lost, as additional costs would be involved. You cannot have it both ways.

Mr. HORNER (*Acadia*): No, you cannot have it both ways.

Mr. MUIR (*Lisgar*): I must disagree with you in connection with the sales because I know from my own experience, and from the experience of my neighbours, that when it came to buying a Cockshutt machine, like a swather either from the Cockshutt dealer or the C.C.I.L., it was invariably bought from Cockshutt, because they did supply a service center in the district involved, and the people bought it because they felt they could go and get quicker service from Cockshutt. I really think that the point C.C.I.L. is falling down on is in connection with giving service.

Mr. GIBBINGS: I believe the management of C.C.I.L. have recognized this. At the present time, I believe they have 40 depots in the three prairie provinces,

and they are intending to expand to 60, in order to fill up some of the gaps and to bring their service a little closer to the producer than otherwise would be the case. I think the point has been well taken and has been recognized by them.

Mr. MUIR (*Lisgar*): Do they also supply repair service in these centers?

Mr. GIBBINGS: Yes.

Mr. KORCHINSKI: Mr. Chairman, my question is along a different line. It has to do with custom-hiring and renting. I know that a certain amount of this is being done, and I think there are certain farmers here who will agree with me when I say that we all go in together on the purchase of certain types of machinery. For example, I have a swather in partnership with others, and that sort of thing. However, do you think custom-hiring is a good feature in the western economy, as far as the farmer is concerned? I could illustrate the case where they have combines coming in all the way from Texas, and they work their way through, right up north. Do you think this is a desirable feature, as far as the farmer is concerned?

Mr. GIBBINGS: The farmer, in making a decision as to whether he will buy or whether he will have his crop harvested by custom-harvesters, is determined to a considerable degree on the availability and timing of the operation. In living where you do, you recognize that the harvesting period is extremely short, and it is quite possible that if a custom machine is not available at the time the crop is ready and the weather is right, a considerable loss could be incurred by the farmer in not getting it under conditions suitable, and, therefore, the value of the product would be affected.

I do believe that there are circumstances and times when the producer would be well advised to rent equipment, if it is available, rather than purchase. There are certain types of equipment which are not used over a long period of the season, which might be rented for that short period in which they are used, even though the rental cost charges appear to be high in relation to the output that the farmer must make in order to purchase it and maintain it. I believe if the farmer sat down over a period and worked this out, it would be to his advantage to rent equipment, rather than to buy it. Of course, this is the other alternative to having custom-done, and the combination of these two might be utilized, I think, to a greater extent by producers in certain specialized types of operation, than is the case today.

Mr. KORCHINSKI: I have been told by machine dealers that there seems to be a thought in the minds of the machine manufacturers, that if, for example, in certain areas—and mine might be one of them which falls in that category—where you have a large number of small farmers, when you have to start paying anything as high as \$10,000 for a combine, you begin to question the advisability of buying one. Is there any objection, then, to machine companies providing this particular type of service, rather than selling the machine? They could do it on a sort of rental basis. They could give the machine to the dealer and he could then go ahead and service it, and provide that type of service. Is there any particular objection from your organization to that happening and, if so, would it affect our western economy?

Mr. GIBBINGS: I have no objection whatever, if it makes a contribution to the farmer's welfare. I think that all avenues must be surveyed by the producer, and that he ought to use the pencil, at least as much as he does, in calculating the relative advantages of alternate courses he might pursue.

Mr. SOUTHAM: Mr. Chairman, I have a supplementary question to that asked by Mr. Korchinski. With this apparent trend that is slowly developing on the part of some farmers to use the pencil, and possibly rent the machinery or collectively purchase it, do you think that if this is developed enough, it

would have a tendency to influence machine companies to take a look at the whole situation, and that it would have the effect of keeping the cost trend down a little bit I am thinking that they might feel that this was a development that was working contrary to their sales expansion, and that it might make them take a serious look, because, from the statistical point of view, their sales picture would change and would go down.

Mr. GIBBINGS: If I might repeat, I do not think that the machinery manufacturers and distributors are immune to the desires of producers, and I think that if there was sufficient demand for this type of thing, although they might be reluctant to do it, they would provide this type of service. I understand that they do this now, to a degree, but more so in the United States than in Canada.

Mr. SOUTHAM: Well, that is my point; if this trend developed to a large enough extent, it would prove to be a factor in the self-preservation of the farm economy, and would cut down the overhead cost of a group of farmers. I am thinking of the collective renting of machinery, rather than each farmer having a full range of machinery.

Mr. GIBBINGS: This is another possibility.

Mr. KORCHINSKI: We do now a considerable amount of custom baling and combining, and this has been going on, to some degree, in the past. However, I think when the price of certain machinery gets to a level where you question the advisability of buying it, there would be a real danger in that we would no longer become independent farmers, and that a lot of these companies would then say, "We will rent everything to you" and we would just become workers for them, to that extent.

Mr. GIBBINGS: I am a great believer in independence, but only at a price. I think that if the producer can give the type of service at a cost which can be demonstrated to be less than if he owned the machinery, then it is to his advantage to do it, give or take whatever he considers to be the price of independence. He might decide, for instance, that there are savings of \$100 a year, or something of this order, and he might consider this is insufficient from the point of view of the convenience of having a machine in his own yard, and that sort of thing. But, with the increasing intensity of the cost-price relationship, I think that you and I will both agree that every possible avenue that the farmer can employ, which will increase his net income, should be explored. I am not sure that all these suggestions we have thrown out here would work all of the time, but if some of them worked some of the time, the producer would be better off by employing them.

Mr. KORCHINSKI: If this trend developed over the years, it might end up by communizing the whole system.

Mr. GIBBINGS: I am neither advocating nor expecting that it will happen.

Mr. MILLIGAN: It is my thought that we have to be practical when we are talking about renting machinery and, if we do so, it should be for only two or three different people. The things we have been talking about are most impractical. Combines and things of that nature are needed today because of the size of the farms, and it is necessary to have individual ownership of them. However, chisel plows and a few specialized tools could be rented. Outside of these specialized tools, I do not think it provides the answer.

There is one question that I would like to ask at this time: I have been informed over the last couple of days that machine companies are increasing the price of machinery by 3 per cent next month. Have you heard any comment to that effect, and is that in western Canada?

Mr. GIBBINGS: I have not had any information, and my only hope is that you are wrong.

Mr. HORNER (*Acadia*): We all hope that you are wrong.

Mr. CLANCY: I appreciate those parts of your brief which deal with repairs and service, but do you not feel that the consumer is somewhat responsible for this lack of service? If I may say so, I come from an area where we have a great number of small dealers. You made a suggestion that they should remain open evenings, and on weekends. I know, in our area, they are open all the time. You mentioned getting the pencil out. What is worth more, paying \$1.25 for a telephone call, or driving 50 miles? Then, you mentioned this pooling system. Custom combining usually was done by a man who had a farm of his own, and, after he did the combining on his own farm, he would then do custom work. We have an example in Saskatchewan of cattlemen feeding concentrates. I know in the Yorkton area a couple of young enterprising farmers have set up a unit whereby they take to the farmer all the machinery that is necessary to do the work and provide everything. It seems to me it is either a case of where you are going to invest capital, or hire these people to come in and do the job for you. Is that what you are referring to by custom work?

Mr. GIBBINGS: Yes, it is a new trend that is taking place in livestock feeding. Farmers are becoming more conscious of the need of adding supplements, and the individual cost of providing this, with the facilities to do it adequately, comes pretty high, in the aggregate. The two enterprising young individuals that I incidentally met the last time I was in Ottawa, are providing a type of service to the producers in that area which will be beneficial because they come onto the farm, use the grain that already is on the farm, do the grinding, mixing and preparing, and do it in very quick order. They did not reveal to me what the costs were going to be, but if it can be done more cheaply than the individual farmer can do it I think it is a type of service that is desirable.

Mr. SOUTHAM: Mr. Chairman, there is one aspect of this whole thing that has not been discussed, as yet, and I was wondering if we could have your comments on it. During our inquiry into the cost of farm machinery and operations, machinery companies have placed a lot of stress on the labour factor. Did the replies to the questionnaire which you sent out to these 887 farmers contain any comments in regard to the labour factor, as it affected farm operations. I am not thinking of the individual cost to the owner, but just the employing of labour. We have had considerable discussion on this. I have made a survey in my own area with respect to bringing farm labour under the Unemployment Insurance Act in an endeavour to improve this problem. Would you care to comment on this?

Mr. GIBBINGS: Mr. Southam, we did not ask a question which would be likely to bring out this type of information. However, we did ask a question at the bottom of page 15—and it is question No. 12: Do you operate your farm entirely alone, or with family help, and so forth? The answers are set out at page 16, and they indicated that 12.7 per cent of the sampled farmers, and 19.5 per cent of the random sampling that we took to check the sample we were using, used hired help, and 22.2 per cent of the sampled farmers and 12.2 of the random farmers used both family and hired help. However, there was nothing in the question that would cause them to indicate whether or not the cost of labour, either in the manufacture of equipment or in their own farming operations, had any effect on it.

Mr. SOUTHAM: I do know that the farmers are experiencing great difficulty in employing competent help, and I was wondering, as a result of this, if that is the reason they are investing to a larger degree in farm machinery. Perhaps this is part of the over-all problem.

Mr. GIBBINGS: I do not think there is any question but that the farmers are replacing labour with equipment. There is the difficulty which all of us experience in trying to acquire competent help on the farm, and that prompts as many of us to do as much as we can ourselves; and this frequently means additional equipment.

Mr. KORCHINSKI: Why did you not put in your questionnaire: "Do you not consider that labour is a contributing factor in the over-all cost of machinery and part, and so on?"

Mr. GIBBINGS: Yes, we considered this was a part. We did not ask that specific question, but I think the purchasers had this in mind when they said that farm machinery, the cost of it, and the cost of repairs, are too high. They probably recognize that one of the contributing factors is the cost of labour, although they did not identify this or any other specific factor as being the cost, or attempt to evaluate the proportion of each that contributed to the higher cost. I understand that you will have before you later, if not already, representatives from the labour groups.

Mr. HORNER (*Acadia*): On Monday.

Mr. GIBBINGS: You might ask some of these questions then.

Mr. KORCHINSKI: Some of the submissions which have been presented here have indicated that labour and transportation and material are the main contributing factors in the price of farm machinery and parts. Do you agree with that?

Mr. GIBBINGS: I believe that these will be the major factors.

Mr. SLOGAN: In the brief from International Harvester they mention an increase in average hourly cost from 1949 to 1960, 99.3 per cent; an increase in retail price of machinery, 60.6 per cent; an increase in the cost of materials, 45.8 per cent. In other words, the cost of material rose at approximately one-half that of the cost of labour. In the Massey-Ferguson report there were similar statistics to show that labour costs had risen more than any other cost factor in the implement industry, and more so than the price of farm machinery. Would you not say then that one of the main factors would be the labour costs contributing to an increase in the price of farm machinery?

Mr. GIBBINGS: Those figures on the surface would appear to indicate this, and they may, in fact, indicate it. I think one of the other factors that might alter that conclusion would be the productivity of labour within those industries. I do not know what it is, whether it has increased or declined; but I think you would recognize that even though the cost of labour, conceivably at least, may go up on a per hour basis—if this were offset or more than offset in increased output per man, the effect would be different.

Mr. SLOGAN: Would you say then that the farmer is not getting the benefit of automation in industry because of the increase in labour costs?

Mr. GIBBINGS: I will agree that the farmer does not appear to be getting the benefits of increased automation. To be specific as to which of the three factors that were outlined in additional cost, on which you want to lay the most blame, I have not examined this closely enough to distinguish it.

Mr. SLOGAN: Conversely, in your statistics you take the cost of a combine in terms of bushels of wheat. You have not taken into consideration the increased productivity of the land, due to better seed, fertilizers, and so on.

Mr. HORNER (*Acadia*): On page 25, the brief states that farmers are borrowing money to purchase machinery and suggests that nearly 16 per cent are doing it through credit unions, that 60 per cent use the bank, and that 6.4 per cent use finance companies. I wish to lay the emphasis there. Then it says that 1.6 get the money from family sources and 5.21 from other sources.

Recently a member of parliament made a statement in the house that 75 per cent of farm machinery purchases were purchased through finance companies. This survey which you carried out does not seem to substantiate that at all. Do you agree?

Mr. GIBBINGS: I do not know how you would expect me to comment on the statements made in the House of Commons. It is a question of semantics I suppose. I do not know what he meant. He may have been thinking of credit unions and banks.

Mr. HORNER (*Acadia*): He was thinking about finance companies, because I happened to be there and was listening closely to him.

Mr. GIBBINGS: My only comment is that in that case the sample we have selected is unrepresentative.

Mr. HORNER (*Acadia*): Your sample certainly does not verify his remarks.

Mr. GIBBINGS: It does not.

Mr. HORNER (*Acadia*): At page 27 in the brief you discuss the question that more farmers are purchasing second-hand machinery in place of new machinery. In fact, this is a kind of conclusion from the preceding pages. Can this be because of relatively good prices? I am looking at it from the farmer's point of view. Is some second-hand farm machinery selling at good prices, in comparison to new machinery?

Mr. GIBBINGS: Yes, I think this is a factor. The farmer, in the light of his economic situation, weighs up whether or not he should buy second-hand or new machinery. Our belief is that at present, in the light again of the economic situation, more of them are deciding it is to their advantage to buy second-hand machinery.

Mr. HORNER (*Acadia*): It is not true right down the line? I know it is true in Alberta. If there is a lot of second-hand machinery on the market, and this tends to decrease the price of the used machinery, the farmer is standing up good buys for farm machinery. Because of better knowledge and better training and because he is more equipped to handle second-hand machinery, I think it was substantiated in your brief that these people who have mechanical training like to purchase second-hand machinery.

There is a further question. At page 32 you say that one-fifth of the sample farmers have technical training in machine shop or motor mechanics. This has increased over the years. Do you agree? In the last five or ten years, the trend is increasing sharply. Do you not agree?

Mr. GIBBINGS: It would only be a "guesstimate".

Mr. HORNER (*Acadia*): It is only a general statement. I realize that.

Mr. GIBBINGS: I have no statistics to influence any judgment I might make on that, but by and large I think you are right. Farmers are recognizing the need for specialized types of training, including machine shop and repair training.

Mr. SOUTHAM: I should like to make an observation on that. I think Mr. Horner has brought out an important point in your brief. I think the leaders in the farm industry, the farm groups themselves and representatives of farmers could encourage this trend on the part of younger farmers to make use of the slack months in the year to take courses in universities or schools in technology and machine shop work. This is very important and we hope it will have an effect in cutting down the overhead costs of farm operations.

Mr. GIBBINGS: I agree with that.

Mr. HORNER (*Acadia*): I notice on page 32 you suggest that 66 per cent of the farmers with training have welding equipment, and 42 per cent without training have welding equipment, and that the use of this is increasing with technical training. With the increasing use of welding equipment and better equipped shops, there would naturally be a tendency to slow up on the purchase of new equipment. Do you agree with this? It would follow, I think.

Mr. GIBBINGS: Yes, I think that is a sound conclusion to arrive at. Welding equipment on modern farms is almost a necessity, due to the changing methods of manufacture. As you know, the frames of the machines and some other components are spot-welded at the time of manufacture. If you should break a frame, it is no longer possible to take the piece off and bring it away for welding; you have to weld it where it is, or take the whole machine to the welder. As a result, many farmers have found it necessary to provide themselves with welding equipment and, therefore, they are taking up technical training.

Mr. HORNER (*Acadia*): Do you not agree that the trend towards steel equipment, rather than cast iron, has brought about the improvement, as far as the farmers are concerned? When these cast iron pieces broke, you could not even weld them, whereas today, machinery made of iron and welded together is much easier to repair and can be repaired and at much cheaper cost than with the heavy cast iron units one used to see many years ago. Do you agree it has been an improvement from that point of view?

Mr. GIBBINGS: Yes I do, and I think theoretically at least it ought to reduce the cost of manufacture.

Mr. HORNER (*Acadia*): And to reduce the cost of the farmers' operations to some extent?

Mr. GIBBINGS: Yes.

Mr. MILLIGAN: I would like to deal with the increase in the cost of labour. I agree it is pretty high, but in that brief we received from John Deere Limited, and which I have been looking over again since we met, I noted that they paid 11.1 per cent in income tax, and they also made a profit of 11 per cent. That was on a wholesale price. So that would be 21.1 per cent of a profit before it ever went to the distributor. Then, the proposed markup of the distributor was 20 per cent. There is 42 per cent above the cost of that machine in labour and materials, added, on before it went to the farmer. Do you think that markup is too high? Do you think they could reduce their markup so that if their markup were lower, they would not pay quite so much in income tax and their profit would not be quite so high. Do you think that is out of line, or if not have you got any argument that labour costs are too high? These figures set out the income tax, the profits to the manufacturer, and then the distribution profit on top of that.

Mr. GIBBINGS: I do not feel that anyone would be justified in blaming labour for all of the increased costs of farm machinery and repairs. If I might make this general statement, I feel that there is a great need in Canada and on the North American continent, not only in the manufacture of farm machinery, but in the manufacture of all other things, for a more statesmanlike attitude on the part of both labour and management. This is especially so with respect to the effect of increasing administrative prices, or any other way as far as the manufacturer is concerned, or as far as labour is concerned, on the over-all price of the product, and its effect on our competitive position on a world-wide basis.

In 1957 when I was in the United Kingdom I was impressed by the statements which were made by some labour leaders there. They seemed to recognize—and were prepared to state so—that the greatest type of security

they could have was to be employed in an industry which was sound, in a sound economy. The United Kingdom, of course, has lived on bringing in raw materials and processing them and exporting manufactured products, to a much greater extent than we have in Canada, or they have on the North American continent. Consequently, it is probably understandable that they would take up that attitude to a greater extent than we have here. In the light of the changes which have taken place in world trade, the changes which have taken place in the re-emerging nations, if you like—those devastated during the war and now re-equipping themselves and competing on international markets—we in the North American continent must recognize that if we are to stay in international trade—and this is vital to us—we must do as others do and become as competitive on the international markets as is possible. This is impossible if we continue to increase the price of the products we have to sell, at a greater speed than our competitors are increasing their prices.

Mr. SOUTHAM: That is a statement I agree with. I have made the same statement myself on a number of occasions after studying this in the United Kingdom, to which Mr. Gibbings has referred.

Mr. MILLIGAN: During the week I had an opportunity of looking at a baler, and an accessory to that baler is a bale thrower. It is a little bit of machinery with a 2 horsepower motor to go on the back, with some 12 inch belting and two inch pulleys, and that is \$550. It is completely out of line with the cost of it. Another thing we use extensively in Ontario is the hay crusher, which has steel rollers, with steel bearings, with wheels under it and power take-off. It costs over \$800. Those prices are quite out of line with the cost of production. I do not know how we are going to get the companies down on those things as they are specialized equipment, but I think they are taking advantage of the purchaser on some of those particular articles.

Mr. FANE: Mr. Chairman, first I would like to say for myself that I personally very much appreciate Mr. Gibbings' brief and his way of handling his answers, and the brief; and speaking of the C.C.I.L. I think I understand from Mr. Gibbings that dealing with the C.C.I.L. co-operative, and buying machinery is an ideal way to do it. I think I could string along with him on that.

Mr. Gibbings was having trouble understanding why the C.C.I.L. was only selling 2 per cent of farm machinery to farmers in western Canada. Now, to establish why that is so, I would like to ask Mr. Gibbings a series of questions. First, when the C.C.I.L. was started about 14 or 15 years ago, they made a deal with the Cockshutt people, and there were a great many farmers at that time who did not like Cockshutt machinery. That may be one of the troubles. Do you think, Mr. Gibbings, that is the case? Why have they not purchased machines from C.C.I.L.? Another party has given an answer to that one.

Mr. GIBBINGS: It is a matter of opinion. I do not know the total share of the market that Cockshutt has, either through their dealerships or through the C.C.I.L. But my feeling is that they do not command a large share of the market, and that it is probably an indication that the producers do not look with favour on their machinery or on their type of service. These are contributing factors.

Mr. FANE: Yes. Again, it might have been different had C.C.I.L. been able to get some other company to make a deal with them, such as International. But in pretty nearly every small town there is a Cockshutt dealer. And in speaking about the area in which I live, the Cockshutt people have picked out to be their dealer perhaps one of the most popular men there. That would be another factor. If Cockshutt were selling machinery, they would not be selling it through the C.C.I.L.

Mr. GIBBINGS: That is another contributing factor.

Mr. FANE: Yes; and then, C.C.I.L. does not have local dealers too. From where I live, Edmonton is the closest place where we can get repairs, and the distance is 60 miles away. Our towns do not stock repair parts. So that is probably another contributing factor. Now, with other machine companies, they have to pick the most popular man they can get in the area. But they are on the spot, as somebody said. They are willing to be on duty themselves, personally, not their help, 24 hours of the day, when the farmers are busy. And, as I said, we all appreciate the fact that the co-operative way should be the ideal way of doing it. But most farmers are very close friends with their dealers, or with some other agency.

Mr. GIBBINGS: Yes, that is another contributing factor.

Mr. FANE: Yes. I received something like 150 replies to the questionnaires which I sent out to various people connected with farming, in some way or another; and I might say that those replies were very closely parallel to the results of your brief here, very close indeed. I think, Mr. Chairman, having established that, that will be all for me. Thank you.

Mr. GUNDLOCK: I am still on my one question. Previously, you said, Mr. Gibbings, or rather you agreed that the cost per horsepower had not risen or had only very slightly risen; but a moment ago you said that the farmer did not have the benefit of automation. In view of all the facts, that several costs have risen, such as transportation, materials, labour, and several others, as the brief mentioned, how can you substantiate the statement that the farmers have not benefited by way of automation? Certainly I think they must have benefited by automation, otherwise that cost factor would not have remained as constant as it has.

Mr. GIBBINGS: This is really quite a difficult thing, because you would be dealing with entirely different circumstances. I was thinking in terms of the advice which farmers receive occasionally, that they should be able, because of the fact that they are using more, and better, and more modern equipment and so on—that they should be able to produce at a lower price. But this has not appeared to be the case with respect to other manufacturers and other producers. And I think almost universally where man has been replaced by machines, the price of the product has gone up during the past ten years, rather than down. And when I say “benefit” there, I am thinking in terms of a reduced price for farm machines as a result of automation; yet the reverse has taken place. To make it more precise, I think you would have to know what the cost would be if automation had not taken place. But as a general statement, I think you would agree that automation has not reduced the price of farm machinery to the producer.

Mr. GUNDLOCK: I am not trying to be ambiguous, but we are listening to both sides of the questions, and we are going to try to come up with some conclusion. You said a moment ago that you thought that farmers had not benefited from automation. We heard in one case of rising costs which have been encountered by automation. In view of that fact, suppose automation had not taken place, and transportation, labour, and material prices, plus anything you care to mention, had kept on rising, certainly would you not admit that the farmers have not benefited by automation?

Mr. GIBBINGS: Well, they have not benefited to the extent of lower prices for farm machinery. That really is the context in which I made the statement.

Mr. GUNDLOCK: That is not the question. You admitted a while ago that there were certain factors and that the prices had risen very little, if any, in some cases, and only slightly in other cases. I am only trying to clarify that one point right now. Have you not admitted previously that what the machine companies said in effect was true?

Mr. GIBBINGS: I said I was prepared to accept it as a fact because I had not made an examination of the factors involved.

Mr. GUNDLOCK: Now you say that we have not benefited by automation.

Mr. GIBBINGS: Well, of course, it is a matter of opinion. You appear to hold the opinion that the farmer has benefited from automation. I was stressing his being benefited by having reduced prices. I do not think that if we sat here and dealt with this for the rest of the day, without having precise information before us, that we could make a scientific investigation of the thing. Neither you nor I is likely to rush into an argument.

Mr. GUNDLOCK: I am not trying to start an argument at all.

Mr. GIBBINGS: I am sorry if I referred to it in that way.

Mr. GUNDLOCK: There is just that one point of benefiting from automation.

Mr. MUIR (*Lisgar*): Since we are dealing with the cost of farm machinery, I am going to take you to section 3 of your summary of recommendations, where you recommend that the major companies improve their manuals and offer farmers improved technical training in farm workshop techniques. I think it is generally recognized that these manuals set out the proper operation of the machines, and are not concerned so much with the repairing of the machines.

Mr. GIBBINGS: Precisely.

Mr. MUIR (*Lisgar*): If they were to do what you suggest, would not that be additional expense to the companies? Do you think it would have any great advantage? Certainly you would have a much larger manual which probably 75 per cent of the farmers would not use at all. Do you not think the manuals are really for the proper operation of the machines?

Mr. GIBBINGS: That is all they are really designed to do. I would agree with that, but the farmers in answering the questionnaire we sent out, said they believed it would be to their advantage in overhauling and repairing farm machinery and equipment if they had a manual that was more descriptive.

Mr. MUIR (*Lisgar*): Would it not be better to have a supplementary manual, that the individual farmer could buy for a couple of dollars?

Mr. HORNER (*Acadia*): Now you are increasing costs.

Mr. MUIR (*Lisgar*): You are increasing costs anyway if they put out a larger manual. The machine companies will have to make up the cost of that somewhere.

Mr. GIBBINGS: If there were a supplementary manual for those who wanted it, it might be better. They could pay for it themselves.

Mr. MUIR (*Lisgar*): They would pay for it anyway.

The CHAIRMAN: I believe Mr. Horner wishes to speak and may I suggest that after he has spoken the debate shall close. Is that agreeable?

Some Hon. MEMBERS: Agreed.

Mr. HORNER (*Acadia*): I was interested in some of the criticisms of machine companies that were suggested by the farmers and I notice, according to page 42, they suggested that perhaps cooperatives should go into the manufacturing business. I believe I have dealt with this previously.

Mr. GIBBINGS: Yes.

Mr. HORNER (*Acadia*): Then I shall go on to page 43. You suggest that most companies come out with an increasing number of new devices. I asked the John Deere people, in particular, if they were the sole manufacturer of implements how many new models would they produce, or what number of their present models they would reduce. They said they would not reduce the number of models anyway, because the farmers were the people who were requesting new models.

In answer to Mr. Forbes, I believe you said there were 75 different types of tractors made in Saskatchewan at the time you sent out your questionnaire. Now, do you think that the farmer who has a two-plow operation would want to buy a five plow tractor or a four plow tractor? Would he not want to buy the machine which suits his own purposes?

Mr. GIBBINGS: Yes.

Mr. HORNER (*Acadia*): If I preferred diesel fuel rather than gas, or vice versa, should I not have the choice as to the type of tractor I purchase? It may be that in my locality diesel fuel might be more advantageous.

Mr. GIBBINGS: This is substantially what I said earlier, that the farm machinery companies appear to be sensitive to the requests of consumers. I am not sure, however, that all of the model changes and all the sizes put on the market are necessary, or that they have been requested. We see a great number of changes.

Mr. HORNER (*Acadia*): If I may, I shall draw your attention to a particular machine. Massey-Harris took over what was formerly known as the Minneapolis Molene G.B., and now it is known as Massey-Ferguson number 995. When they first took over these tractors—

Mr. GIBBINGS: They took over the engine.

Mr. HORNER (*Acadia*): No, they took over the tractors as a whole, improved them, painted them red, and sold them. When they first took over the model it had an old seat which would remind one of the type of seat on a horse-drawn plow. Also, the platform was not in the most appropriate position, and one of the dealers who appeared before this committee told me he could not sell it at all. Then, Massey Harris came out with a changed version. They put a fancy seat on it and built up the platform, and one of the dealers who was down here said he sold five of them the following spring.

Mr. GIBBINGS: I do not think there is any question that farmers do not like to have improvements on their equipment. If they did not, obviously as you have suggested, the tractors would not sell.

Mr. HORNER (*Acadia*): And this is why the machine companies are sensitive to the farmers' requests. If they were not, they would not sell their machines, and that is what was implied before this committee. Maybe they are over-sensitive, though I am not saying they are. It is very hard to hit the fine line exactly, and I am sure you will agree with me.

Mr. GIBBINGS: I do.

The CHAIRMAN: Well, gentlemen, before we adjourn I wish to thank Mr. Gibbings and Mr. Phillips, of the Saskatchewan wheat pool, who have appeared before us today. I think they have done an excellent job in condensing the opinions of the 887 farmers in the Saskatchewan area who answered their questionnaire. For the information of the witnesses, however, I might say that many of the members of this committee have sent out their own questionnaires, and they have got quite a good response. I am sure the committee will take into consideration the suggestions you have brought before us today, and I hope they will be valuable to us when we are drafting our reports.

Mr. GIBBINGS: Thank you very much, Mr. Chairman. May I say we have appreciated the opportunity of coming before you, and may I express the wish that some of the information we have submitted will be useful to the committee in its deliberations. We wish you every success, and we hope you will be successful in making recommendations to reduce the price of farm machinery to the farmers.

The CHAIRMAN: Our next meeting will be on Monday morning at 9.30 o'clock, when the Canadian labour congress will be in attendance.

APPENDIX "A"

STATEMENT OF CONSOLIDATED INCOME

MASSEY-FERGUSON LIMITED

Year ended October 31, 1960 (with comparative figures for 1959)

	1960	1959
Net sales.....	\$490,413,988	\$475,543,641
Add:		
Interest and finance charges earned, etc.....	4,308,643	3,651,307
Profit on sale of capital assets.....	764,919	203,374
	<u>\$495,487,550</u>	<u>\$479,398,322</u>
Deduct:		
Cost of goods sold.....	\$390,547,157	\$378,633,650
Marketing expenses.....	46,099,406	42,072,662
General and administrative expenses.....	15,151,683	12,745,822
Engineering expenses.....	11,692,388	8,606,011
Interest on long term debt.....	4,839,198	3,442,826
Minority interest (dividends on preferred shares of subsidiaries)....	231,028	226,825
Bank interest.....	8,799,018	4,615,688
Exchange adjustments.....	(3,014,230)	1,890,694
	<u>\$474,345,648</u>	<u>\$452,234,178</u>
Profit before income taxes and special provision.....	\$ 21,141,902	\$ 27,164,144
Income taxes.....	11,216,768	13,345,751
Tax credits (Note 3).....	(3,900,000)	(7,200,000)
Special provision for abandoned production equipment \$1,348,042, less applicable taxes.....	671,190	
Net income for the year.....	<u>\$ 13,153,944</u>	<u>\$ 21,018,393</u>

SUPPLEMENTARY INFORMATION

The following amounts were paid during the year ended October 31, 1960 to the directors, executive officers and solicitors of the Parent Company: Fees to directors not holding salaried employment \$51,915; remuneration to executive officers including directors holding salaried employment, and to the Company's solicitors \$761,236.

Depreciation, and amortization of production tooling included above amounted to \$18,761,090 in 1960 and \$12,130,775 in 1959.

STATEMENT OF CONSOLIDATED RETAINED EARNINGS

Year ended October 31, 1960 (with comparative figures for 1959)

Balance at beginning of year.....	\$109,287,629	\$ 93,252,554
Add:		
Net income for the year.....	13,153,944	21,018,393
Transfers from capital surplus.....		1,680,569
	<u>\$122,441,573</u>	<u>\$115,951,516</u>
Deduct:		
Dividends on preferred shares.....	\$ 1,418,986	\$ 1,091,587
Dividends on common shares (40c. per share).....	4,836,077	4,654,002
Commission and other expenses relating to issue of 5½% preferred shares.....		918,298
	<u>\$ 6,255,063</u>	<u>\$ 6,663,887</u>
Balance at end of year.....	<u>\$116,186,510</u>	<u>\$109,287,629</u>

(See accompanying notes to financial statements)

CONSOLIDATED BALANCE SHEET

MASSEY-FERGUSON LIMITED

October 31, 1960 (with comparative figures at October 31, 1959)

ASSETS

CURRENT:

Cash.....

Receivables (less allowances and unearned interest—Note 2)

Retail notes.....

Wholesale notes and accounts.....

Other trade and sundry accounts.....

Inventories, valued at the lower of cost or market

Raw materials and work in process.....

Finished goods.....

Insurance deposits, prepaid expenses, etc.....

Total Current Assets.....

INVESTMENTS (Shares and advances):

Wholly-owned finance companies, at cost less provision for losses (Note 1).....

Associated companies, at cost.....

FIXED:

Land.....

Buildings.....

Machinery and equipment.....

Production tooling.....

Total fixed assets, at cost.....

Less accumulated depreciation and amortization.....

OTHER ASSETS AND DEFERRED CHARGES.....

Approved on behalf of the Board:

W. Eric Phillips, Director

Albert A. Thornbrough, Director

LIABILITIES

CURRENT:

Bank loans and overdrafts.....

Accounts payable and accrued charges.....

Income, sales and other taxes payable.....

Dividends payable.....

Advance payments from customers.....

Total Current Liabilities.....

DEFERRED INCOME TAXES (Note 3).....

MINORITY INTEREST (Preferred shares of subsidiaries).....

LONG TERM DEBT:

Bonds, debentures, notes and loans (Note 7):

Less instalments maturing within one year, included with accounts payable and accrued charges.....

CAPITAL AND RETAINED EARNINGS:

Authorized share capital—

500,000 preferred shares, par value \$100 each

20,000,000 common shares without nominal or par value

Outstanding (Note 4)—

Cumulative convertible preferred shares

4½% redeemable at \$104.50 (1960—9,665

5½% 1959 series—redeemable at \$105.50

(See accompanying notes to financial statements)

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS

YEAR ENDED OCTOBER 31, 1960

1. *Basis of Consolidation and Exchange Conversion*

The accompanying financial statements consolidate the accounts of all subsidiary companies with the exception of the two wholly-owned finance companies in North America—Massey-Ferguson Finance Company of Canada Limited and Massey-Ferguson Finance Corporation. These companies, which began operation in September 1960, were formed to purchase instalment contracts of retail purchasers of Massey-Ferguson equipment. Full provision has been made in the accompanying statement of consolidated income for the losses incurred by these companies to October 31, 1960, such losses arising principally from the use of a cash rather than an accrual basis of accounting. A combined statement of assets and liabilities of the two finance companies is shown on page 21 of this report.

The assets, liabilities, income and expenses of United States companies are included in the consolidated statements on the basis of U.S. \$1=Can. \$1. In the case of all other companies, exchange conversion into Canadian dollars has been effected as follows: current assets and current liabilities at exchange rates prevailing at October 31; investments, fixed assets, long term liabilities and depreciation provisions on the basis of rates prevailing at date of acquisition or issue; income and expenses (other than depreciation provisions) at average exchange rates in effect during the period.

2. *Receivables*

Approximately \$26,000,000 or 16% of the 1960 notes and accounts receivable mature beyond one year. Receivables are shown net of the following provisions—

	1960		1959	
	For returns and allowances	For unearned interest	Total	Total
	\$	\$	\$	\$
Retail notes.....	320,606	258,359	578,965	3,544,515
Wholesale notes and accounts.....	10,236,685	735,773	10,972,458	10,094,139
Other trade and sundry accounts.....	290,041	134,634	424,675	326,116
	10,847,332	1,128,766	11,976,098	13,964,770

The reduction from 1959 in provisions against retail notes arises principally from the sale of North American retail contracts to wholly-owned finance companies in 1960.

3. *Income Taxes*

For income tax purposes certain of the companies claim capital allowances in excess of the depreciation provisions recorded in the accounts. The tax reductions applicable to these extra allowances are not reflected in income, but are credited instead to a "Deferred Income Taxes" account (shown separately in the balance sheet) to be brought into income in future years when the total allowances available for tax purposes are less than the depreciation provisions recorded in the accounts.

The "tax credits" shown for 1960 and 1959 in the statement of consolidated income represent the amount of tax reductions reflected in the accounts in these years by reason of the carry-forward of (a) prior years' losses and (b) prior years' provisions and write-offs charged in the accounts but not previously claimed or taken into account for tax purposes. As at October 31, 1960 certain of the companies have further loss balances available for carry-forward as well as a number of provision or write-off balances not yet claimed or taken into account for tax purposes.

4. Share Capital Changes, Stock Options and Reservation of Shares

During the year 22,560 common shares were issued for cash under employee options at \$6.50 per share and 195 $4\frac{1}{2}\%$ preferred shares were purchased for redemption. Employee options were outstanding at October 31, 1960 with respect to an additional 69,570 common shares (57,070 at \$6.50 per share and 12,500 at \$8.25 per share) exercisable at any time up to May 29, 1962. A further 17,500 unissued common shares are reserved for additional employee options and 1,577,320 unissued common shares are reserved for possible issuance upon conversion of cumulative convertible preferred shares.

5. Dividend Restrictions

The trust indentures relating to the long term debt of the Canadian company and the trust indentures and loan agreements of certain of the subsidiary companies contain certain restrictions on the payment of dividends. Under the most restrictive of these approximately \$55,000,000 of consolidated retained earnings at October 31, 1960 is not available for the payment of dividends on common shares. Of the remainder, approximately \$32,000,000 represents the unrestricted portion of profits of various subsidiary companies outside North America which have not been remitted to Canada. Transfers of earnings from such companies are generally subject to the approval of exchange control authorities, but permission to pay dividends is normally obtainable.

Dividend payments from the United Kingdom, South Africa, India, Argentina and Mexico are not subject to withholding taxes. On dividend payments from subsidiaries in other countries withholding taxes apply, but as the amount of earnings which will be transferred in the future and the rates which will be applicable at that time are not known, such taxes are reflected in consolidated earnings only at the time of actual dividend remittance.

Of consolidated retained earnings, an amount of \$46,865 is designated as a "capital surplus" under the provisions of Section 61 of the Companies Act (Canada).

6. Contingent Liabilities, Commitments, etc.

(a) Contingent liabilities in respect of bills under discount amount to approximately \$29,000,000.

(b) Capital expenditure commitments outstanding at October 31, 1960 (including an agreement to purchase all the shares of an Italian tractor manufacturing company and an undertaking to make further advances to an associated company) total approximately \$14,000,000.

(c) Pension costs (including payments to trustees on behalf of employees covered by trustee pension plans) are charged against income in the year of payment. Past service costs, in the case of trustee plans, are generally being funded over a 30 year period; the total unfunded liability for all trustee plans in effect at October 31, 1960 is estimated at approximately \$20,000,000.

7. Long Term Debt

	October 31, 1960	October 31, 1959
Massey-Ferguson Limited (Canada):		
First mortgage sinking fund 3% bonds Series "A" maturing 1966.....	\$ 6,402,000	\$ 6,560,000

Notes to Financial Statements October 31, 1960

NOTE 1. INVENTORIES AND COST OF GOODS SOLD. Inventories are valued at the lower of cost or market, market having been considered generally as replacement values; such replacement values with respect to finished goods and work in process include overhead based on estimated normal operating conditions.

NOTE 2. SUBSIDIARY COMPANY INVESTMENT AND EARNINGS. It is the Company's practice to include each year in its statement of income the dividends received from its subsidiary. The Company's equity in the net assets of the subsidiary as shown by the audited financial statements was in excess of the Company's investment therein by \$715,651 at October 31, 1960, being the Company's share of undistributed earnings of the subsidiary since acquisition. These undistributed earnings have not been included in the financial statements.

NOTE 3. RESTRICTED RETAINED EARNINGS. Under the provisions of a loan agreement dated November 1, 1956 relating to \$5,000,000 5½% notes payable, the Company agreed not to declare or pay any dividend (other than in common stock) on any of its common shares, or to expend any money in the acquisition or redemption of any shares of its capital stock, if immediately after such action, the aggregate of all such declarations, payments and expenditures subsequent to October 31, 1955 shall exceed an amount equal to its net income accrued subsequent to that date. Of the retained earnings at October 31, 1960 approximately \$32,787,000 is restricted under the foregoing provisions.

NOTE 4. RETIREMENT PLANS. The Company has a voluntary Contributory Annuity Plan and a Non-Contributory Pension Plan providing benefits for service subsequent to December 31, 1953, both of which are fully funded through Company contributions to trustees. In addition the Company has a Non-Contributory Pension Plan, which has not been funded and which was originally established in 1908, providing benefits for service prior to January 1, 1954, and under which no further credits can be established. Based on an actuarial valuation at December 31, 1958 the estimated amount required to fund this latter plan at October 31, 1960 is \$15,313,852. In respect of this plan a provision for employees' retirement benefits as shown on the balance sheet of October 31, 1960 is \$4,109,867, which is \$11,203,985 less than the actuarially estimated liability.

The Company's total contributions for all retirement plans amounted to \$1,616,924 after a reduction of \$594,345 representing contributions withheld to absorb the surplus in the funded plans per the December 31, 1958 actuarial valuation. The total contributions of \$1,616,924 during the year ended October 31, 1960 were charged \$1,409,747 to income and \$207,177 to the provision for employees' retirement benefits.

NOTE 5. CONVERSION OF FOREIGN EXCHANGE. Current assets and liabilities of foreign origin have been converted generally at the exchange rates prevailing at the close of the Company's fiscal year. Plant and property acquired from sources outside Canada have been converted generally at rates of exchange prevailing at dates of acquisition.

NOTE 6. DEPRECIATION. Cost of sales and selling and administrative expenses include depreciation amounting to \$2,879,611 for the year ended October 31, 1960; 1959—\$3,257,023.

NOTE 7. CAPITAL COMMITMENTS. The Company had commitments for capital expenditure of approximately \$2,213,000 as at October 31, 1960.

Signed on behalf of the Board: L. J. MURPHY, Director
W. B. GAY, Director*Notes to Financial Statements October 31, 1960*

NOTE 1. In accordance with the agreement between the Corporation and International Harvester Company of Canada, Limited relating to financing of notes receivable, the Corporation purchases wholesale notes of dealers and distributors from International Harvester Company of Canada, Limited at face value less 1% discount and less cash and prepayment discounts which dealers are expected to take in settlement of their notes. The 1% discount is taken into income upon settlement of the notes and the cash and prepayment discounts are taken into income when such discounts are no longer available to dealers.

In instances where the terms of wholesale notes purchased do not provide the Corporation with interest income at rates agreed upon between International Harvester Company of Canada, Limited and the Corporation, International Harvester Company of Canada, Limited pays the Corporation amounts equal to differences between interest computed at agreed upon rates and interest received from dealers.

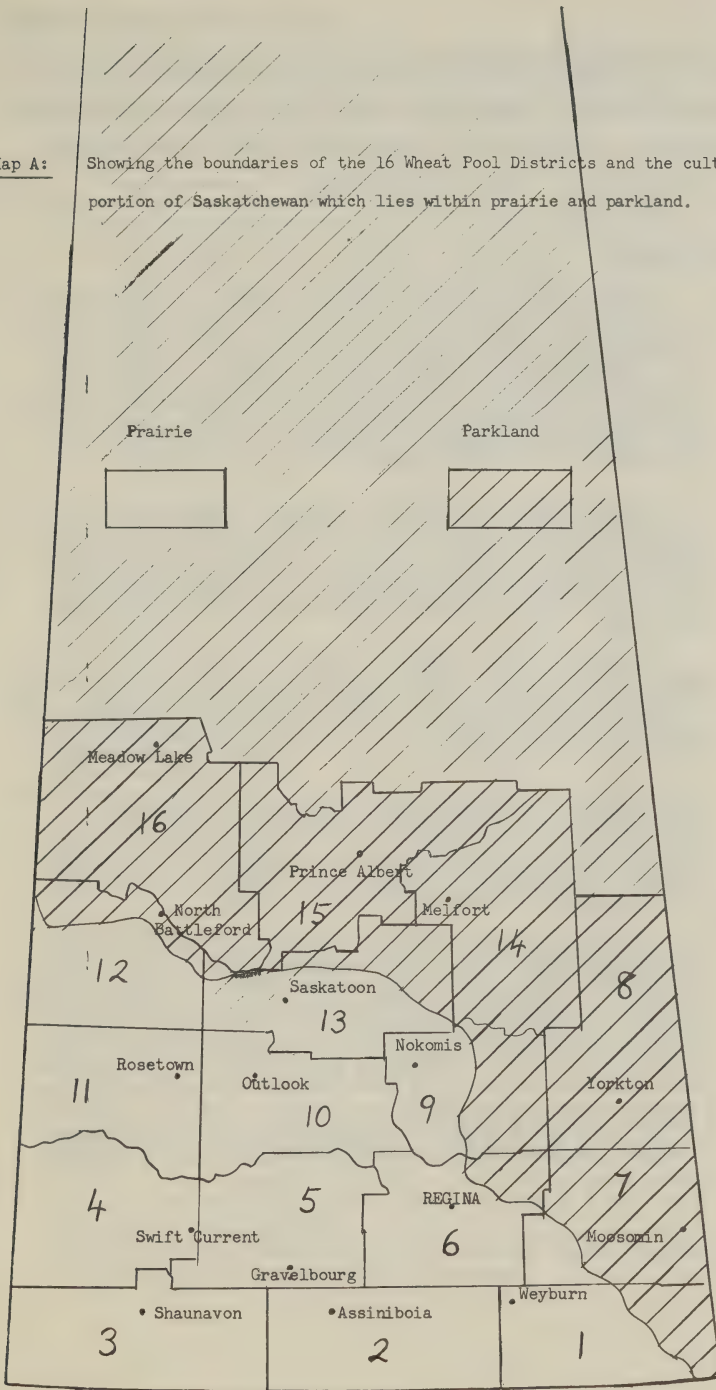

Finance charges included in the face amounts of retail contracts are taken into income over the life of the contracts. Where such finance charges are less than the Corporation's finance charges, the related contracts are acquired by the Corporation at discount rates which enable it to earn its regular finance charges, these discounts are also taken into income over the life of the contracts.

NOTE 2. At October 31, 1960, retail notes receivable include \$1,823,458 maturing after October 31, 1961, of which \$633,185 will mature after October 31, 1962, and wholesale notes included \$558,313 which will mature after October 31, 1961, of which none will mature after October 31, 1962.

NOTE 3. During the year ended October 31, 1960, 10,000 shares of capital stock were issued at par and paid for in cash.

REPORT OF A SURVEY CONDUCTED IN 1960 BY SASKATCHEWAN WHEAT POOL INTO
CERTAIN ASPECTS OF FARMING OPERATIONS IN THE PROVINCE WITH PARTICULAR
REFERENCE TO THE ACQUISITION, MAINTENANCE AND USE OF FARM MACHINERY

AND EQUIPMENT

Introduction

Saskatchewan Wheat Pool decided to survey a group of farmers to obtain first-hand information on which to base a submission to the proposed investigation of farm machinery prices by the House of Commons' standing committee on agriculture and colonization. By the time the nature of the survey was determined the winter had arrived and winter road conditions were considered too unpredictable to accommodate a random sampling of Saskatchewan farmers. The urgency of the situation precluded waiting until spring to undertake this kind of survey.

It was decided to send questionnaires by mail to secretaries of Wheat Pool local committees. Secretaries were selected for many reasons, not the least of which was that while they may not be representative farmers they might at least respond readily. The fact that more than 80 per cent of the farmers surveyed on this basis returned usable replies indicates the wisdom of that decision.

There is a local committee at every delivery point and Saskatchewan Wheat Pool is represented at 1,090 delivery points. There is also a local committee at some 45 inland ports--communities at which there is no country elevator but where farmers have sufficient community of interest to operate a committee concerned with their grain deliveries. Farmers at these inland ports deliver their grain to Pool elevators nearby. Committees have from seven to 11 members, all farmer-members of Saskatchewan Wheat Pool. They name one of their number to be secretary whose main job is to keep the records and handle the correspondence. Secretaries receive no pay for their duties. Occasionally committees name the local elevator agent to be their secretary.

It was considered that local committee secretaries might be the best educated among committee members, might farm differently than other farmers in the community and because of their expressed interest in co-operatives might have different views on many subjects. To determine just how "different" secretaries were as farmers we attempted to sample farmers who were not even local committee members as a basis for comparison. Some differences were found but in total they do not appear to upset on any single point the value of the larger sampling as a base for determining factual detail and obtaining farmer opinions about farming practices and the acquisition, maintenance and use of farm machinery.

Method of conducting the survey

On December 2, 1960, a one-sheet questionnaire containing 32 questions was sent by mail to the 1,093 local committee secretaries on the mailing list at that date. With it went a self-addressed and stamped return envelope and a letter from the secretary of Saskatchewan Wheat Pool which said:

"We are sending this to you in your capacity as secretary of the local Wheat Pool committee because we know you will understand, through your active work in the Wheat Pool organization, the importance of our getting the best possible reply from these questionnaires. If you are a Pool elevator agent and do not operate a farm, we would appreciate it if you would ask the chairman of the committee to fill out the questionnaire. We have mailed 1,100 questionnaires, one to each committee secretary. A complete return would represent slightly more than one per cent of Saskatchewan farming population. The number is low enough when you want representative opinion, and were it to fall much below that figure, any conclusions we might wish to draw from the returns might prove unsatisfactory." 1/

On December 2, 1960, the director of the Wheat Pool's country organization sent a letter to his 16 fieldmen—one in each of the 16 Wheat Pool districts—advising them of the mailed survey and asking them to co-operate by distributing on a more random basis another 80 questionnaires to be used as a base for checking the uniqueness of returns from the larger sample. Each fieldman received five questionnaires, distinctly marked to differentiate them. Fieldmen were asked to distribute these 80 on a random basis and several methods were proposed although fieldmen were not asked to report which method they had used. In total 41 replies were received from the 80 sent for this random selection and results of these were compared with results from the larger sampling.

Subsequently the manager of the Wheat Pool's country elevator division wrote to elevator agents at all delivery points advising them of the survey and asking them to encourage local committee secretaries to complete the questionnaire and return it as soon as possible. The survey was mentioned twice on the Wheat Pool's bi-weekly radio program, each time in a brief announcement asking farmers to complete the questionnaires early. Because of the urgency of completing a submission based on these questionnaires, none received after January 4 was considered in the analysis. However, questionnaires continued to arrive for weeks after that date and 15 from the sample and one from the random selection had to be rejected because they arrived late. A few more were returned with some of the vital questions unanswered and these also were rejected.

By December 6 the first returns began to arrive and they continued with regular frequency for a month. In total, 887 replies of use to the survey were received and used in the analysis. This accounts for 81.15 per cent of the total questionnaires distributed and constitutes an unusually high return for a mailed questionnaire.

1/ The full text of this and other letters sent during the survey may be found in an appendix to this report

The questionnaire was designed to ask questions that could be answered simply without a farmer's detailed reference to records which might not be readily available. Because of this limitation some questions which might have helped the survey were omitted. The questions were also posed in a manner to provide ease in counting and tabulating the results.

The 32 questions were designed by our research analyst who also conducted the analysis. The first count of the 887 questionnaires took four girls from our head office staff about one month. Later two girls were engaged to count returns from question 24 which asked about farm machinery inventories. Throughout the analysis the country elevator division assisted greatly by making available comptometer operators for computation of figures required for the tables.

Validity of Sample

It was recognized that committee secretaries might be different because they are committee secretaries and that any farmer approached for survey information by anyone from Saskatchewan Wheat Pool might also be different because he would likely be a Wheat Pool member. The comparison of the sampling and the random selection, contained in the following pages, indicates that local committee secretaries as farmers are, in fact, not all that different from farmers in general. Any difference based on Wheat Pool membership has little validity because more than 80 per cent of all farmers in this province are in fact Wheat Pool members. The provincial government estimates at 97,000 the total number of farms in the province in 1960. In the crop-year ended July 31, 1960, a total of 77,500 individual farmers were listed as members of Saskatchewan Wheat Pool and eligible for excess charges refunds based on their grain and livestock deliveries. This being so it would appear impossible for any survey among Saskatchewan farmers on any basis to avoid including in its returns a very high percentage of Wheat Pool members.

From this we have assumed that information determined from replies to the questionnaire is of considerable use to the preparation of a submission to this parliamentary committee and has not been rendered peculiar merely because most of the farmers questioned were either Wheat Pool members or secretaries of local committees.

The questionnaire was prefaced with the following:

QUESTIONNAIRE ON FARM MACHINERY

THIS QUESTIONNAIRE IS DESIGNED TO GIVE SASKATCHEWAN WHEAT POOL INFORMATION ON WHICH TO BASE A SUBMISSION TO THE HOUSE OF COMMONS' STANDING COMMITTEE ON AGRICULTURE WHICH WILL HOLD PUBLIC HEARINGS EARLY IN 1961 TO INVESTIGATE THE FARM MACHINERY SITUATION. PLEASE ANSWER ALL QUESTIONS FULLY AND FRANKLY. NO ATTEMPT WILL BE MADE TO IDENTIFY YOU WITH ANY OF YOUR REPLIES AND THEY WILL BE KEPT IN CONFIDENCE.

<p>MOST QUESTIONS MAY BE ANSWERED SIMPLY BY MAKING A <input checked="" type="checkbox"/> MARK IN <u>ONE</u> OF THE SQUARES PROVIDED AFTER EACH QUESTION. PLEASE ANSWER <u>ALL</u> QUESTIONS. QUESTIONS 23, 28, 31 and 32 PROVIDE SPACE FOR YOU TO EXPRESS YOUR OPINION ABOUT CERTAIN MATTERS. DO NOT HESITATE TO GIVE US YOUR FULLEST VIEW.</p>

1. Distribution of replies

Question 1: Location of your farm: Wheat Pool district ☐ Sub-district ☐

Total replies were received from 887 sample farmers and from 41 in the random selection on the following basis by Wheat Pool districts. The farmer's name did not appear on the replies.

Table 1A: Comparison of sample and random selection as to distribution of replies

<u>Wheat Pool District</u>	<u>Sample</u>	<u>Random selection</u>
1	50	2
2	40	2
3	34	-
4	34	1
5	47	-
6	66	-
7	60	4
8	46	3
9	51	2
10	51	4
11	65	2
12	55	4
13	70	1
14	60	5
15	44	2
16	56	4
<u>Unidentified</u>	<u>58</u>	<u>5</u>
Totals	887	41

The unidentified are farmers who declined to give their Wheat Pool district, the only identifying mark on the questionnaire. These replies were considered in the totals of 887 and 41 when all other pertinent questions were answered.

2. Distribution of land size

Question 2: Size of your farm (in quarter sections): ☐ quarters.

The 887 replies to this question indicate that more than 70 per cent of the sample and the random selection operate farms between two and six quarter sections in size with the greatest concentration of both on land holdings of four quarters. More than 21 per cent of the sample and nearly 30 per cent of the random selection operate farms of four quarters in size.

Table 2A: Comparison of sample and random selection as to farm size

<u>Size in quarters</u>	<u>Sample</u>		<u>Random selection</u>	
	<u>No.</u>	<u>%</u>	<u>No.</u>	<u>%</u>
1Q	18	2.0	1	2.4

Totals	887	100.0	41	100.0

STANDING COMMITTEE

(In Table 2A replies from farmers on 9Q, 10Q, 11Q, 12Q and over 12Q are all grouped in the category "over 8Q" for all other questions but are shown here separately to indicate the distribution of these 110 larger farmers).

3. Type of farming operation

Question 3: Kind of farming operation: All grain ☐; all livestock ☐; mixed ☐.

The 880 replies indicate that more than 80 per cent of the sample consider themselves mixed farmers. Of the random selection just under 80 per cent consider themselves mixed farmers.

Table 3A: Comparison of sample and random selection as to type of farming

<u>Total replies</u>	<u>All grain</u>	<u>All livestock</u>	<u>Mixed</u>
Sample 880	19.32%	0.45%	80.23%
Random 41	21.9	-	78.1

The replies to questions 1, 2 and 3 compiled in one table provide a ready reference to the distribution of the sample farmers among Wheat Pool district, size of farms and type of farming operation. (see Table 3B on page 5)

Table 3B: Distribution of sample as to Wheat Pool district, farm size and type of farming

4. Type of land tenancy

Question 4: Your land holding: entirely owned ☐; entirely rented ☐;
partly owned-rented ☐.

The 878 replies indicate that more than half of the sample operate their land on an owner-renter basis, 40% own all of their land and 6.7% rent all of their land. The 41 replies from the random selection show a marked difference in land tenancy: one-third of these farmers operate on an owner-renter basis, just over half entirely own their land, and about 12% rent all of their land. The 1956 inter-census report indicated land tenancy distributed on about the same basis as the 1960 random selection with 52.4% of 103,391 farmers then owning all their land, 13% renting it all, and 33.9% operating on an owner-renter basis. Fewer than one per cent of farms in 1956 were operated by managers. While the 1960 sample may show too high a percentage of farmers with owner-renter tenancy it is generally understood that the move in the years since 1956 to increase land holding by renting additional land would have changed the total picture more than the results of the random selection indicate.

Table 4A: Comparison of sample and random selection with 1956 inter-census report as to land tenancy

	<u>Entirely owned</u>	<u>Entirely rented</u>	<u>Owner-renter</u>
Sample 878	40.1%	6.7%	53.2%
Random 41	53.7	12.2	34.1
1956 census report 103,391	52.4	13.0	33.9

There is a definite relationship between land size and the kind of land tenancy. In general, more smaller farmers own more of their land than either rent it or operate it on an owner-renter basis and more larger farmers operate on the owner-renter basis. A conclusion which may be drawn from the tabulations in Table 4B is that the move by the middle-sized and larger farmers to become even larger is directing them towards renting additional land, accounting for the higher portion of the larger farmers who hold land tenancy on an owner-renter basis. It suggests that the smaller farmers who own their land are less able to rent additional land.

Table 4B: Relationship of land tenancy to farm size

<u>Total reporting by quarters</u>	<u>Entirely owned</u>	<u>Entirely rented</u>	<u>Owner-renter</u>
1 16	81.25%	12.50%	6.25%

Totals 878	40.1 %	6.7 %	53.2 %

Tabulations in Table 4C and for most subsequent questions are shown to provide for directors, staff and farmers in each of the 16 districts a ready picture of how their district relates to the average for the province as a whole. The "unidentified" shown in column one of this table are those farmers who declined to name their Wheat Pool district when they answered the questionnaire.

Table 4C shows above average incidence of land ownership in nine districts (2, 3, 4, 5, 7, 8, 14, 15 and 16) and above the average for the

owner-renter tenancy in seven districts (6, 9, 10, 11, 12, 13 and 14). District 14 is unique in having higher than average percentage of farms owned by the operators and a higher than average percentage of farms operated on an owner-renter basis. The only district with a relatively high rental situation is District 1 where 18% of all sample farmers rent all of their land holdings.

Table 4C: Distribution of land tenancy by Wheat Pool district

Total reporting by districts		Entirely owned	Entirely rented	Owner-renter
1	50	34.00%	18.00%	48.00%

5. Land under Purchase

Question 5: If under purchase, payments still being made: Yes ☐; No ☐.

Some 367 farmers of the total sample are still making payments on land under purchase. This is 41.3% of the total. Of farmers in the random selection, 13 or 31.7% of the 41 farmers are still paying for land under purchase.

Table 5A: Comparison of sample and random selection as to land still under purchase.

	Still making payments
Sample - 887	41.4%
Random - 41	31.7%

Farmers who operate four quarters or more appear to be buying more land than the farmers who operate smaller holdings, indicating it is the bigger farmers who are moving to expand their land holding still further.

Table 5B: Relationship of land under purchase to farm size

Total reporting by quarters		Farmers still making payments	Percentage
1	18	3	16.67
2	110	34	30.91

STANDING COMMITTEE

Farmers in seven districts (2, 5, 9, 10, 11, 12 and 15) appear to be buying more land still under purchase than the average for all of the sample. Half or more of the farmers in Districts 2, 11, 12 and 15 are still making payments for land under purchase.

Table 5C: Distribution of land under purchase by Wheat Pool district

Total reporting in districts	Farmers still making payments	Percentage
1 50	20	40.0
2 40	20	50.0

6. Farming experience

Question 6: Your farming experience: under 5 yrs. ☐; 5-10 yrs. ☐; 11-20 yrs. ☐; 21-30 yrs. ☐; 31-40 yrs. ☐; over 40 yrs. ☐.

The 882 replies indicate that two-thirds of the sample have between 11 and 30 years of farming experience. Few have less than five years of experience while about seven per cent have 40 years or more. Among farmers in the random selection there are more with less than five years of experience and more with over 30 years of experience.

Table 6A: Comparison of sample and random selection as to farming experience.

No. of farmers	Under 5 yrs.	5-10 yrs.	11-20 yrs.	21-30 yrs.	31-40 yrs.	Over 40 yrs.

Totals	882	.68%	9.41 %	38.32 %	30.62 %	14.28 %

7. Education

Question 7: Your education: Public School ☐; High School ☐; University courses ☐.

The 883 replies show the sample farmers about equally divided between those who attended public school and those who attended high school. A higher percentage of the random selection farmers have only public school education and fewer have high school and university.

Table 7A: Comparison of sample and random selection as to education.

	Public school	High school	University
Sample 883	43.4%	46.8%	9.8%
Random 40	57.5	35.0	7.5

There is a tendency for farmers with lower educational standards to operate smaller farms and for those with the higher standard to operate the larger farms. For example, most of the sample farmers on one-quarter section are listed under those with public school, and of those farming more than eight quarters 60 per cent have completed high school and nearly 10 per cent university courses.

Table 7B: Relationship of education factor to farm size

Replies by size in quarters	Public school	High school	University
1	18	72.22 %	27.78 %
2	109	47.71	44.95
3	126	48.41	45.24
4	194	41.75	50.52
5	112	45.54	45.54
6	96	43.75	39.58
7	64	35.94	50.00
8	55	47.27	32.73
Over 8	109	31.19	59.63
Totals	883	43.4 %	46.8 %

STANDING COMMITTEE

More than 10 per cent of the sample farmers in five districts (6, 7, 9, 10 and 11) have university courses and more than 20 per cent of the farmers in District 2 have university courses. The lowest incidence of university trained farmers was reported from Districts 1 and 3. Half or more of the sample farmers in Districts 4, 8, 13 and 15 have public school training and half or more of the farmers in Districts 1, 3, 5, 6, 10 and 11 have high school training.

Table 7C: Distribution of the education factor by Wheat Pool districts

Total reporting by districts		Public school	High School	University
1	50	40.0 %	56.0 %	4.0 %
2	39	41.03	38.46	20.51
3	33	33.33	63.64	3.03
4	34	58.82	32.35	8.83
5	47	34.04	57.45	8.51
6	66	33.33	53.03	13.64

Totals	883	43.4 %	46.8 %	9.8 %

8. Age of Farmers

Question 8: Your Age: 20-30 yrs. ☐; 31-40 yrs. ☐; 41-50 yrs. ☐; 51-60 yrs. ☐; over 60 yrs. ☐.

The 885 replies in the sample indicate 70 per cent of the farmers aged between 31 and 50 years. Only 5.6 per cent of them are over 60 years of age. Replies from the farmers in the random selection indicate fewer farmers in the younger groupings and more in the older groupings. For example, nearly 10 per cent of the random selection are over 60 years of age.

Table 8A: Comparison of sample and random selection as to age of farmers

	20-30 yrs.	31-40 yrs.	41-50 yrs.	51-60 yrs.	Over 60 yrs.
Sample 885	11.6 %	31.9 %	38.1 %	12.8 %	5.6 %
Random 41	4.9	29.3	26.8	29.2	9.8

More of the younger farmers are on the larger-sized farms and more of the farmers over 60 are on the smaller-sized farms. Other than these two observations it would be difficult to relate too directly the farmer's age to the size of his farming operation.

Table 8B: Relationship of the age factor to farm size

Replies by size in quarters		20-30 yrs.	31-40 yrs.	41-50 yrs.	51-60 yrs.	Over 60 yrs.

9. Where farmers live

Question 9: Do you live on the farm all year round ☐; part of year only ☐; not at all ☐.

The 880 replies show more than 88 per cent of the sample farmers live on their farms all year round. The balance are about evenly divided between those who live on the farm only part of the year and those who say they do not live on the farm at all. More of the farmers in the random selection live away from their farm, at least part of the year.

Table 9A: Comparison of sample and random selection as to where farmers live

	All year on farm	Part of year	Not at all
Sample 880	88.3%	5.8%	5.9%
Random 41	82.9	9.8	7.3

All of the 18 sample farmers who operate one-quarter section farms live on their farm all year round, 90 per cent or more of the farmers on five quarters, six quarters, seven quarters and more than eight quarters live on the farm all year round. Ten per cent of the farmers who operate eight quarters live on the farm only part of the year, and smaller percentages reported under this category for all of the other farm sizes. Of the farmers who do not live on their farms at all, the lowest percentage is reported by farmers on the largest farms, those who farm more than eight quarters. The highest was reported by farmers on three quarters.

Table 9B: Relationship of farm residence to farm size

Replies by size in quarters	Live on farm all year	Part of year	Not at all
1 18	100.0 %	-	-
2 109	85.32	7.34 %	7.34 %
3 126	85.71	6.35	7.94

10. Off-farm jobs

Question 10: Do you also have an off-farm job: Yes ☐; No ☐; Does your wife: Yes ☐; No ☐.

Of the sample farmers 12.7 per cent have off-farm jobs and 3.8 per cent of them say their wives have; of the random selection 19.5 per cent have off-farm jobs and 4.9 per cent of them say their wives have.

Table 10A: Comparison of sample and random selection as to farmers and wives with off-farm jobs.

	Those with off-farm jobs	Wives with off-farm jobs
Sample 887	12.7%	3.8%
Random 41	19.5	4.9

More of the sample farmers on the smaller sized farms have off-farm jobs and conversely more of the farmers on the very large farms say their wives have. Of the 110 farmers who operate more than eight quarters, nine per cent say their wives have off-farm jobs.

Table 10B: Relationship of farmers and their wives with off-farm jobs to farm size

Total farmers by quarters		Farmers with off-farm jobs	Wives with off-farm jobs
1	18	33.33 %	-

11. Community activity

Question 11: Have you held an elected position within the last five years in any local organization other than the Wheat Pool Committee: Yes ☐; No ☐.

Affirmative replies from 615 farmers indicate that 69.3 per cent held an elected position outside of the Wheat Pool committee in the last five years. In the random selection 58.5 per cent held such elected positions.

Table 11A: Comparison of sample and random selection as to community activity

	<u>With elected positions</u>
Sample 887	69.3%
Random 41	58.5

There is no direct relationship between farm size and the percentage of farmers with elected positions. Seventy-nine per cent of the farmers on seven quarters had elected positions, 73 per cent of the farmers on four quarters had and 72 per cent of the farmers on one quarter. The lowest percentage is among the 110 farmers on two quarters--only 61.8 per cent held elected positions.

Table 11B: Relationship of community activity to farm size

<u>Total farmers by quarters</u>	<u>With elected positions</u>
1 18	72.22 %
2 110	61.82

12. Help on the farm

Question 12: Do you operate farm entirely alone ☐; with family ☐; hired help ☐; with both ☐.

Replies from 881 farmers indicate that 22 per cent operate the farm entirely alone. Just over 40 per cent operate with family help, 12 per cent use hired help and 21 per cent use both hired help and family help. Farmers in the random selection apparently use more hired help but the percentages of them operating entirely alone or with family is about the same as for the sample.

Table 12A: Comparison of sample and random selection as to help on the farm

	<u>Entirely alone</u>	<u>With family</u>	<u>With hired help</u>	<u>With both</u>
Sample 881	22.3 %	43.8 %	12.7 %	21.2 %
Random 41	24.4	43.9	19.5	12.2

More of the smaller farmers operate their farm entirely alone or with family help. More of the larger farmers have hired help or operate with a combination of hired help and family help.

Table 12B: Relationship of hired help to farm size

Total replies by quarters		<u>Entirely alone</u>	<u>With family</u>	<u>With hired help</u>	<u>With both</u>

Totals	881	22.36 %	43.93 %	12.71 %	21.00 %

Thirty per cent or more of the farmers in Districts 1, 3 and 10 operate their farms entirely alone. The lowest percentage of farmers without any additional help is in District 8 where only ten per cent operate entirely alone. More than half of the farmers in Districts 8, 12 and 14 operate farms with family help. Of farmers who use hired help the highest percentage is in District 10 where 22 per cent of the sample have hired help. District 7 is the lowest with only five per cent recording hired help.

13. Extent of hired help in 1960

Question 13: If you have hired help, how many man-days did they work in 1960: man-days.

Replies from 346 farmers in the sample indicate that nearly a third of them employed hired help in 1960 for 90 man-days or more. It is recognized that there may have been some misunderstanding about what the term "man-days" means, and it is just possible that some of these farmers recorded the total number of days in which they hired help rather than man-days.

Table 13A: Comparison of sample and random selection as to the use of hired help

	Percentage of total replies for each				
	1-15 days	16-30 days	31-60 days	61-90 days	Over 90 man-days
Sample 346	19.4 %	21.4 %	19.1 %	7.5 %	32.6 %
Random 16	-	31.2	12.5	-	56.3

More than half of the random selection said they had hired help in 1960 for 90 man-days or more; none had any for less than the two weeks.

In total, 39 per cent of the sample had hired help in 1960. More of the farmers on smaller farms had hired help for shorter periods of time and more of the farmers on the larger farms had hired help for 90 man-days or more.

Table 13B: Relationship of hired help in 1960 to farm size

Total farmers by quarters	Total replies by quarters No. % of total		Percentage of total replies for each				
			Man				
			1-15 days	16-30	31-60	61-90	Over 90 days
1	18	-	-	-	-	-	-
2	110	22 20.00 %	54.54 %	4.55 %	31.81 %	4.55 %	4.55 %

Over 8	110	72 66.36	6.85	12.34	12.34	5.46	63.01
Totals	887	346 39.0 %	19.4 %	21.4 %	19.1 %	7.5 %	32.6 %

More than half of the sample farmers in Districts 3 and 13 had hired help in 1960 for more than 90 man-days. Only 19 per cent of the farmers in District 15 had hired help for more than 90 man-days. More of the sample farmers in District 15 than any other district hired help during the year. More than 59 per cent of them reported under this question. The fewest number of replies came from District 1 where only 24 per cent of the farmers recorded hired help in 1960.

14. Current value of farm machinery owned

Question 14: Estimated total current value of all your farm machinery owned:
 \$5,000 or less ☐; \$5,-\$10,000 ☐; \$10,-\$20,000 ☐; \$20,-\$30,000 ☐;
 over \$30,000 ☐.

Replies from 866 farmers in the sample indicate that more than one-third of the total estimate the current value of their owned farm machinery at between \$10,000 and \$20,000. Among the 40 farmers replying in the random selection the highest value group incidence was in a lower range, between \$5,000 and \$10,000. These figures may be compared with figures contained in the report from the Saskatchewan Department of

Agriculture on the operation of 455 members of farm management clubs in the province in 1959. These 455 farmers said their average investment in machines and equipment in 1959 was \$9,782.00 for an average of 17 per cent of their total farm investment. More of the sample farmers than of the random selection farmers record their inventory under \$5,000 and more of the random selection farmers record their inventory at over \$20,000. It must be pointed out that the question asked only for "an estimated total current value" and did not define what was meant by that term. Consequently there is no way of knowing whether all or how many of the farmers concede depreciation in determining the current value of machinery.

Table 14A: Comparison of sample and random selection as to estimated total current value of owned farm machinery

	Under \$5,000	\$5,-\$10,000	\$10,-\$20,000	\$20,-\$30,000	Over \$30,000
Sample 866	18.5 %	32.9 %	37.4 %	9.1 %	2.1%
Random 40	5.4	45.0	30.0	15.0	5.0

The distribution of machinery investment by farm size is, of course, of more interest to this study than is the distribution of these estimates among all farmers. Table 14B demonstrates that more of the smaller farmers have machinery inventories valued under \$5,000 than have the larger farmers, and that more of the larger farmers have machinery inventories valued at more than \$20,000 than have smaller farmers. None of the farmers on one quarter have machinery valued at more than \$20,000, and none of the farmers on one, two or three quarters have machinery valued at more than \$30,000.

STANDING COMMITTEE

Table 14B: Relationship of farm machinery investment to farm size

Totals 866	18.5 %	32.9 %	37.4 %	9.1 %	2.1 %

While Table 14B demonstrates the percentage of sample farmers on each farm size who recorded the various machinery investment values, Table 14C demonstrates the percentage of farmers recording investment of varying values who occupied farms of varying sizes. It is the same table tipped sideways to show more readily, for example, that of farmers reporting machinery investment over \$30,000, 16 per cent are on 18 quarters, 61 per cent farm more than eight quarters, and so on.

Table 14C: Distribution of farm size among various groupings by value of farm machinery

None of the sample farmers in Districts 1, 2, 5, 7, 12 or 14 have investment in machinery at more than \$30,000. The highest percentage of farmers reporting in the top investment group are the six per cent of the 33 farmers in District 3. At the other end of the scale, more than one-third of the farmers in District 16 have farm machinery whose current value is less than \$5,000, and more than twenty per cent of the farmers in Districts 2, 7, 8, 10 and 11 are in this lowest category.

15. Sufficient machinery

Question 15: Have you enough machinery for your operation: Yes ☐; No ☐; too much ☐.

The 887 replies indicate that 58 per cent of the sample farmers consider they have enough machinery, 40 per cent have not enough, and fewer than one per cent have too much. Farmers in the random selection differ little in their opinion about having enough or not enough but quite a few more of them consider they have too much.

Table 15A: Comparison of sample and random selection as to sufficient machinery

	<u>Enough</u>	<u>Not enough</u>	<u>Too much</u>
Sample 887	58.9 %	40.4 %	0.7 %
Random 41	58.5	39.0	2.5

None of the smallest farmers and none of the biggest sample farmers have too much machinery, but in general there is little direct relationship between farm size and the farmer's attitude about sufficient machinery.

Table 15B: Relationship of attitudes on machinery inventory to farm size

Total replies by quarters	<u>Enough</u>	<u>Not enough</u>	<u>Too much</u>
1 18	72.22 %	27.78 %	-
2 108	45.37	53.70	00.93 %

16. Custom Hiring of machinery

Question 16: Do you do custom work for others ☐; do others custom for you ☐; both ☐; neither ☐.

Replies from 828 farmers indicate that an even 50 per cent of the sample engage in custom hiring or renting of machinery. Slightly fewer of the farmers in the random selection engage in custom hiring or renting.

Table 16A: Comparison of sample and random selection as to custom hiring of machinery

	Rent out machinery	Hire custom work	Both	Neither
Sample 828	17.6 %	16.1 %	16.3 %	50.0 %
Random 38	10.5	10.5	21.1	57.9

Smaller farmers tend to hire machinery more than they rent it and larger farmers tend to rent out machinery more than they hire it. This suggests that the smaller farmers have more need for the machinery than the larger ones.

Table 16B: Relationship of custom hiring to farm size

Replies by quarters	Rent out machinery	Hire custom work	Both	Neither
1 15	13.33 %	20.00 %	13.33 %	53.34 %

17. Sharing of machinery

Question 17: Do neighbors use your machinery ☐; do you use theirs ☐;
both ☐; No sharing ☐.

The 832 replies indicate that about two-thirds of the sample farmers share machinery, either lending it or borrowing it from others. Only half of the farmers in the random selection lend or borrow machinery.

Table 17A: Comparison of sample and random selection as to machinery sharing

	Lend machinery	Borrow machinery	Both	Neither
Sample 832	11.2 %	2.9 %	47.0 %	38.9 %
Random 32	9.4	-	40.6	50.0

More of the larger farmers lend machinery than borrow it, and more of the smaller farmers borrow machinery than lend it. This suggests that the smaller farmers have greater need of machinery than larger farmers and that the larger ones have available more machinery they can let others use. There is little real difference between smaller and larger farmers on the question of sharing machinery on both ends of the transaction, lending and borrowing as the following table indicates.

Table 17B: Relationship of machinery sharing to farm size

Replies by quarters	Lend machinery	Borrow machinery	Both	Neither
1 16	6.25 %	6.25 %	43.75 %	43.75 %

8 55	10.91	1.82	38.18	49.09
Over 8 55	12.97	1.85	42.59	42.59
Totals 832	11.2 %	2.9 %	47.0 %	38.9 %

The least machinery sharing is done by the farmers in Districts 3, 5, and 7, half or more of whom say they neither lend nor borrow machinery. The most machinery sharing is done by farmers in Districts 9, 10, 11, 14 and 16, in which districts two-thirds or more of the farmers either lend or borrow machines or both.

Table 17C: Distribution of machinery sharing by Wheat Pool districts

Replies by districts	Lend machinery	Borrow machinery	Both	Neither

18. New vs. second-hand machinery

Question 18: Do you buy all your machinery new ☐; some new ☐; none new ☐.

More than 80 per cent of the sample farmers usually buy at least some of their machinery second-hand. Only 17.8 per cent said they buy all their machinery new. Slightly more of the farmers in the random selection buy all of their machinery new.

Table 18A: Comparison of sample and random selection on purchase of new vs second-hand machinery

	All new	Some new	None new
Sample 878	17.8 %	75.2 %	7.0 %
Random 40	25.0	65.0	10.0

Slightly more of the larger sample farmers usually buy all of their machinery new. Among those who buy none new, are more than 20 per cent of the farmers on one and two quarters.

Table 18B: Relationship of new or second-hand machinery purchases by farm size

Replies by quarters	All new	Some new	None new
1 18	5.56 %	72.22 %	22.22 %
2 108	11.11	68.52	20.37

Over 8 109	20.18	78.90	.92
Totals 878	17.8 %	75.2 %	7.0 %

Sample farmers in Districts 5, 14 and 16 appear less able to buy any new machinery. More than 10 per cent of the farmers in these three districts said they buy no new machinery. Farmers in Districts 2, 5, 11, 13 and 14 are apparently better able or more inclined to buy all of their machinery new. In these five districts more than 20 per cent buy all their machinery new. In District 2 more than 27 per cent of the 40 farmers buy all of their machinery new.

19. Purchase of new machinery or implements in the years 1958 - 1960

Question 19: Did you buy any new implements in any of the last three years:
Yes ☐; No ☐.

IF YES:

In 1960 were they valued under \$500 ☐; \$500-\$2000 ☐; \$2000-\$5000 ☐; over \$5000 ☐.
In 1959 were they valued under \$500 ☐; \$500-\$2000 ☐; \$2000-\$5000 ☐; over \$5000 ☐.
In 1958 were they valued under \$500 ☐; \$500-\$2000 ☐; \$2000-\$5000 ☐; over \$5000 ☐.

Replies from 628 sample farmers indicate that 70.8 per cent of the total bought some new machinery in the three-year period. Among farmers in the random sample 70.7 per cent bought some new machinery in the three-year period. Of the farmers who bought new machinery in the three-year period 371 bought new machinery in 1958, 406 bought new machinery in 1959, and 462 bought new machinery in 1960.

20. Second-hand machinery purchases 1958-1960

Question 20: Did you buy any used or second-hand implements in the last three years: Yes ☐; No ☐.

IF YES:	
In 1960 was it valued under \$500 <input type="checkbox"/> ; \$500-\$2000 <input type="checkbox"/> ; \$2000-\$5000 <input type="checkbox"/> ; over \$5000 <input type="checkbox"/> .	
In 1959 was it valued under \$500 <input type="checkbox"/> ; \$500-\$2000 <input type="checkbox"/> ; \$2000-\$5000 <input type="checkbox"/> ; over \$5000 <input type="checkbox"/> .	
In 1960 was it valued under \$500 <input type="checkbox"/> ; \$500-\$2000 <input type="checkbox"/> ; \$2000-\$5000 <input type="checkbox"/> ; over \$5000 <input type="checkbox"/> .	

Replies from 560 farmers indicated that 63.13% of the sample bought second-hand machinery in the three-year period. This is a slightly higher percentage than the 56.1 per cent of the random selection who bought second-hand machinery in the three-year period.

Table 20A: Comparison of sample and random selection as to second-hand machinery purchases 1958-1960

		Bought second-hand machinery
Sample	887	63.1%
Random	41	56.1

Of the sample farmers who bought second-hand machinery in the three-year period, 272 bought second-hand machinery in 1958, 305 bought second-hand machinery in 1959, and 406 bought second-hand machinery in 1960.

Table 20B: Second-hand machinery purchases 1958-1960

Total replies	Purchasers		Percentage of total farmers and value purchased			
	No.	% of total	Under \$500	\$400-\$2,000	\$2,000-\$5,000	Over \$5,000
887 1958	272	30.67	14.09	12.97	3.38	0.23
887 1959	305	34.39	16.12	14.09	3.72	0.45
887 1960	406	45.77	19.39	19.50	5.64	1.24

There was a much greater increase in the number of sample farmers purchasing second-hand machinery in the last three years than the number of farmers purchasing new machinery. For example, of farmers buying new machinery valued under \$500, in 1958 there were 83, 1959 there were 93, 1960 there were 75 farmers; of farmers purchasing second-hand machinery valued under \$500, in 1958 there were 125, in 1959 there were 143 and in 1960 there were 172. This kind of absolute increase in the number of farmers from year to year held true for all of the values. Even for purchases of the highest value of new and second-hand machinery, that is over \$5,000, the number of farmers buying new machinery in this category increased from 51 to 99 during the three-year period, while the number of farmers buying second-hand machinery in this value category increased from two to eleven.

Table 20C demonstrates that the larger the farmer, the better able he was during the last three years to buy new machinery. The smaller farmers tend to be those who bought larger quantities of the lower valued machinery; more of the larger farmers bought the higher valued machinery.

21. Credit used for machinery purchases

Question 21: Did you get credit to buy machinery (new or used): from Credit Union ☐; Bank ☐; Finance Company ☐; family members ☐; others ☐; no credit needed ☐.

Of the sample farmers 251 or 28.3 per cent of the total pay cash for machinery, that is they need no credit; of the random selection 15 farmers or 36.5 per cent of the total of 41 buy machinery for cash or need no credit. Of the farmers who use credit more than 60 per cent of both the sample and the random selection get their credit from the bank.

Table 21A: Comparison of sample and random selection as to credit methods

	<u>Credit union</u>	<u>Bank</u>	<u>Finance Co.</u>	<u>Family</u>	<u>Other</u>	<u>Cash</u>
Sample 652	16.0%	60.7%	8.4%	11.7%	5.2%	28.3%
Random 19	15.8	63.2	-	-	21.0	36.5

Replies indicate little relationship between farm size and whether a farmer is able to pay cash or not for his machinery purchased. However, of those who do use the various credit facilities a higher portion of the larger farmers than of the smaller farmers use the banks. Of the 12 farmers who replied from farms of one quarter size, none use finance companies and 75 per cent use the banks; this was the highest portion of farmers on any farm size using the banks. But of the farmers on two quarters or more, the smaller farmers tend to use banks less than do the larger farmers. The smaller farmers also tend to get their money from family members or from other sources more than do the larger farmers.

Table 21B: Relationship of credit methods to farm size								
Total who need credit by quarters						Cash Purchases		
						Total Sample	% not needing credit

Sample farmers in District 3 appear the best situated as far as purchasing machinery for cash is concerned--47 per cent need no credit. More than 30 per cent of the farmers in six other districts are able to buy for cash, in Districts 4, 6, 7, 9, 10 and 13. Of the farmers using credit facilities, three-quarters or more of the farmers in Districts 6, 7, 12 and 15 use the banks. Credit Unions are used by more of the sample farmers in Districts 4 and 9, a third or more in each. Only five per cent of the farmers in Districts 1 and 10 use credit unions. Sample farmers in District 3 are the only farmers who do not use finance companies at all. More than 10 per cent of the sample farmers in Districts 4, 8 and 15 use finance companies.

22. Farm Improvement loans

Question 22: If you got loan to buy machinery, did you use Farm Improvement loan: Yes ☐; No ☐.

Of the 652 replies about credit facilities, 67 per cent use Farm Improvement loans for the purchase of farm machinery and 51 per cent of the random selection buying machinery on credit use Farm Improvement loan.

Table 22A: Comparison of sample and random selection in the use of Farm Improvement loans

	<u>Percentage of farmers buying on credit who use Farm Improvement loans</u>
Sample 652	67.64%
Random 19	51.2

On the average more of the larger sample farmers use the Farm Improvement loans than do the smaller farmers. More than 80 per cent of the farmers reporting from eight quarters use Farm Improvement loans on the purchase of machinery while fewer than 60 per cent of the farmers on both one and two quarters use Farm Improvement loans for machinery purchases.

23. Suitability of machinery

Question 23: Are all your machines suitable for the job required of them:
Yes ☐; No ☐.

If no give details.

Of the 887 sample farmers 64 per cent have suitable machinery compared with 80 per cent of the random selection. Of those who indicate machinery not suitable, some say it is too light in construction and will not stand up under their conditions; some say their machines are too difficult to adjust and many cite what they consider unsuitable characteristics of particular machines.

Table 23 A: Comparison of sample and random selection as to suitability of machinery

	<u>Machinery suitable</u>
Sample 887	64.4%
Random 41	80.5

More than three-quarters of the farmers on one quarter section find their machinery suitable but the farmers on other farm sizes indicate little difference between the attitudes of the smaller and larger farmers. They range by farm size between 60 and 67 per cent.

Table 23B: Relationship of suitability of machinery to farm size

<u>Total farmers by quarters</u>	<u>Machinery suitable</u>
1 18	77.78%
2 110	60.00
3 126	63.49
4 192	63.02
5 114	67.54
6 97	63.92
7 63	66.67
8 57	63.16
Over 8 110	66.36
Totals 887	64.37%

Eighty per cent of the sample farmers in District 14 have suitable machinery and 75 per cent of those in District 2; 70 per cent in Districts 4, 11 and 12 have suitable machinery. The least satisfied are sample farmers in District 16 where only 50 per cent say their machinery is suitable.

Table 23C: Distribution of suitability of machinery by Wheat Pool districts

By adding the percentage of farmers reporting new or second-hand machines on the basis of the above table, the sample farmers as a group may own at least one tractor but fewer than 100 per cent of the sample owns one of any of the other machines. On the other hand, the random selection farmers each may own at least one tractor and also one truck on the basis of reporting in the above table.

Table 24B considers the inventory reported by only the sample to show the relationship of farmers reporting ownership of each machine to the total number of farmers reporting. This shows, for example, more farmers own tractors than there are farmers reporting, but for all other machines fewer farmers cite ownership than there are farmers reporting.

Table 24B: Number of sample farmers reporting ownership of various machines together with the ratio of farmers reporting each machine to total number of farmers

Implement or machine	Total farmers	Report new machines				Report used machines				All farmers report- ing	Ratio

The following tables indicate the relationship to farm size of ownership of both new and second-hand machines of each of the 21 kinds. They will be considered individually.

Tractors: More sample farmers own new tractors than second-hand tractors.

The survey shows little direct relationship between farm size and the ownership of one new tractor. However, more of the larger farmers own two new tractors than do smaller farmers. Only the larger farmers own three new tractors. The same kind of relationship holds for the ownership of second-hand tractors. Most of the farmers on one quarter report one second-hand tractor but among the farmers on the other farm sizes there is not so direct a relationship between farm size ownership of one second-hand tractor. However, there is a direct relationship between the ownership of two second-hand tractors and farm size, with more of the larger farmers owning two second-hand tractors than the smaller farmers. Only the larger farmers own three tractors or more.

Table 24C Tractors: Relationship of Tractor ownership to farm size *

Trucks: More sample farmers own second-hand trucks than new trucks. More bigger farmers than smaller farmers have one new truck. There is, however not the same direct relationship between farm size and the ownership of one second-hand truck. Fewer farmers own two trucks, either new or second-hand, than own two tractors. There is also considerably less ownership of the third truck among the sample farmers.

Automobiles: Slightly more sample farmers own new cars than second-hand cars. In general, fewer of the smaller farmers buy new cars than buy second-hand ones, and more of the larger farmers buy new cars than buy second-hand ones. Very few farmers own more than one automobile, whether new or second-hand. None of the farmers own three second-hand cars although some of them own three new cars.

* Re figures 1, 2 and 3 in the heading of this table and of all subsequent tables relating to question 24 refer to ownership of one, two or three and more machines.

One-ways: Slightly more sample farmers own second-hand one-ways than new one-ways. The survey indicates no direct relationship between farm size and the ownership of either new or second-hand one-ways. Some of the relatively small farmers report ownership of two second-hand one-ways but ownership of three one-ways, either new or second-hand, is limited to a single report from a farmer on four quarters.

Table 24C One-ways: Relationship of One-way ownership to farm size

Diskers: About twice as many sample farmers own new diskers as own second-hand ones. More of the larger farmers own new diskers than second-hand diskers and fewer of the smaller farmers own new diskers. But in the ownership of second-hand diskers there is little direct relationship to farm size. None of the farmers own three diskers.

Cultivators: Twice as many sample farmers own new cultivators as own second-hand cultivators. More of the larger farmers own new cultivators than own second-hand ones, and of the smaller farmers there is also a tendency for owning more of the new cultivators than second-hand ones except for farmers on one quarter only. None of the farmers own three second-hand cultivators but a few of them own three new cultivators, particularly the larger farmers.

Seed Drills: More sample farmers own second-hand seed drills than new seed drills. Among smaller farmers more own second-hand seed drills than own new seed drills but among the large farmers, that is the very large farmers, there is a slight tendency for them to own more new seed drills than second-hand seed drills. No farmers own three second-hand seed drills, and one farmer who farms more than eight quarters owns three new seed drills.

Weed Sprayers: A much larger percentage of the sample farmers own new weed sprayers than second-hand weed sprayers and there is little evidence, except among the very big farmers, of ownership of more than one weed sprayer per farm. More of the larger farmers own new weed sprayers than do the smaller farmers. There is also some indication that more of the larger farmers own second-hand weed sprayers. On the whole the incidence of ownership of weed sprayers of any kind is directly related to farm size with fewer of the smaller farmers having any kind of a weed sprayer and many more of the larger farmers having both new and second-hand.

Hay Mowers: Slightly more sample farmers own new hay mowers than own second-hand hay mowers. More of the larger farmers own new hay mowers than own second-hand ones and more of the smaller farmers own second-hand hay mowers than own new ones. None of the farmers own three hay mowers and only a very few own two.

Hay Rakes: More sample farmers own second-hand hay rakes than own new ones. None of the farmers on one quarter own new hay rakes but more than half of them own second-hand hay rakes. More of the farmers on the larger farms own new hay rakes and more of the farmers on the smaller farms own second-hand hay rakes. None of the farmers own three hay rakes.

Hay Balers: About a quarter of the sample farmers own new hay balers. Fewer than 10 per cent of them own second-hand hay balers. More of the larger farmers own hay balers than do smaller farmers. Among those who own second-hand hay balers there is not nearly as direct a relationship to farm size. None of the farmers own three hay balers and only one farmer who farms more than eight quarters owns two hay balers.

Hay Pickup: Few sample farmers in total own hay pickups but more own new pickups than second-hand ones. There is a slight tendency for more of the larger farmers to own a new hay pickup than smaller farmers, but ownership of second-hand hay pickups is not directly related to farm size.

The following tables show the distribution of new and second-hand machinery inventory by Wheat Pool district. As the above tables show machinery by farm size the following tables indicate the percentage of farmers in each district who own one, two, three or more new and second-hand machines for each of the 21 kinds of machinery.

STANDING COMMITTEE

25. Machinery Breakdowns 1960

Question 25: How many times did you have a breakdown in 1960 you were NOT able to fix on farm .

Replies indicate that 554 sample farmers had one or more breakdowns in 1960 and that 24 of the random selection had breakdowns during 1960. The number of breakdowns reported by these farmers have been tabulated on the basis shown in Table 25A.

Table 25A: Comparison of sample and random selection as to machinery breakdowns in 1960					
	One bkdown	Two bkdowns	Three bkdowns	4 -10 bkdowns	Over 10 breakdowns
Sample 887	20.0 %	13.5 %	8.9 %	16.9 %	3.2 %
Random 41	12.2	12.2	7.3	22.0	4.9

Among sample farmers there is little direct difference between the number of breakdowns and farm size. Smaller and larger farmers are plagued about equally by machinery breakdowns.

Table 25B: Relationship of machinery breakdowns in 1960 to farm size					
Farmers by quarters	One bkdown	Two bkdowns	Three bkdowns	4 - 10 bkdowns	Over 10 breakdowns
1 18	22.22 %	11.11 %	16.67 %	11.11 %	5.56 %
2 120	21.82	13.64	7.27	13.64	9.09
3 126	17.46	13.49	6.35	19.84	3.17
4 192	24.28	11.46	8.85	17.71	5.21

8 57	28.07	10.53	14.04	14.04	5.26
Over 8 110	20.00	20.00	7.27	19.09	2.73
Totals 887	19.95 %	13.53 %	8.91 %	16.91 %	3.16 %

None of the farmers in Districts 3, 4, 8, 9 and 15 had more than ten breakdowns in the year. Of farmers reporting between four and ten breakdowns in the year were more than 20 per cent of the farmers in Districts 5, 12 and 15, and more than 30 per cent of the farmers in Districts 8 and 9.

Table 25C: Distribution of Machinery breakdowns in 1960 by Wheat Pool districts					
Farmers by districts	One bkdown	Two bkdowns	Three bkdowns	4 - 10 bkdowns	Over 10 breakdowns
1 50	16.00 %	16.00 %	14.00 %	8.00 %	4.00 %
2 40	17.50	10.00	5.00	17.50	2.50

Unident. 58	22.41	8.62	8.62	17.24	8.62
Totals 887	19.95 %	13.53 %	8.91 %	16.91 %	3.16 %

26. Duration of Farm Breakdowns in 1960

Question 26: If any breakdowns of any kind in 1960 how many days in total were you held up: days.

Sixty per cent of the farmers in both the sample and the random selection were delayed from one to seven days by breakdowns in 1960. Some of the farmers were held up more than a month but none of the farmers in the random selection said they were held up more than 30 days.

Table 26A: Comparison of sample and random selection as to duration of breakdown delays in 1960.

	1-2 dys.	2-7 dys.	8-14 dys.	15-30 dys.	31-60 dys.	Over 60 days
Sample 887	31.3 %	29.2 %	9.0 %	2.3 %	0.2 %	0.2 %
Random 41	43.9	19.5	9.8	4.9	-	-

There has been no attempt to relate the duration of breakdown delays to farm size. The distribution of these delays by Wheat Pool district is given in the following table.

Table 26B: Distribution of duration of delays by Wheat Pool districts

Total farmers by districts	1-2 dys.	2-7 dys.	8-14 dys.	15-30 dys.	31-60 dys.	Over 60 days
1 50	32.00 %	28.00 %	10.00 %	2.00 %	-	-
2 40	30.00	32.50	5.00	-	-	-
3 34	20.59	32.33	11.76	-	-	-

15 44	15.90	34.09	11.36	4.55	-	-
16 56	37.50	26.79	14.29	1.78	-	-
Unident. 58	29.31	34.48	12.07	-	-	-
Totals 887	31.34 %	29.20 %	9.02 %	2.25 %	0.23 %	0.23 %

27. Miles travelled to get repair parts

Question 27: If you had to pick up parts how many miles did you travel to get them: miles.

More than 30 per cent of the sample travel more than 50 miles to get repair parts. Fewer than 20 per cent of the random selection travel more than 50 miles. While there may have been some misunderstanding about whether the question sought round-trip distances or the single distance from farm to repair depot replies are tabulated on the assumption that the farmers recorded only the one-way distances.

Table 27 A: Comparison of sample and random as to distance travelled for repair parts.

	1 - 10 miles	11-20 miles	21-50 miles	50-100 miles	Over 100 miles
Sample 774	16.1 %	24.0 %	29.6 %	15.1 %	15.2 %
Random 37	35.1	35.1	10.8	8.2	10.8

There has been no attempt to relate the distance travelled for repair parts to farm size. Location of farm rather than its size is the principal factor in this question. More than 20 per cent of the sample farmers in Districts 2, 3, and 5 drive between 50 and 100 miles to get repair parts, and more than 20 per cent of the farmers in Districts 3, 10 and 15 drive more than 100 miles.

Table 27B: Distribution of distance travelled for repair parts by Wheat Pool district

Farmers replying by districts	1 -- 10 miles	11 -- 20 miles	21 -- 50 miles	50 -- 100 miles	Over 100 miles
1	44	11.36 %	27.27 %	40.91 %	15.91 %
2	35	17.14	17.14	31.43	20.00
3	28	10.71	14.29	32.14	21.43

15	37	18.92	16.22	27.03	13.51
16	49	20.41	14.29	34.69	16.32
Unidentified 53	13.21	16.98	35.85	18.87	15.09
Totals	774	16.15 %	25.32 %	29.59 %	13.69 %

28. Question 28:

If more than one breakdown in 1960 give further details

Details given by the farmers to this question appear to add little to the purpose of this survey. Some farmers said their machinery was too old, some went into great detail about the kind of breakdown they had. None of the replies provide information suitable for reproduction here.

29. Farm Workshop Equipment

Question 29: If you were able to repair breakdowns on the farm, do you have:

Welding equipment ☐; chain hoist ☐; power drill ☐.

There is little major difference between replies of farmers in the sample and in the random selection about the farm workshop equipment they possess. Sixty percent of the sample farmers have power drills, 47 per cent have welding equipment and 34 per cent have chain hoists. These three tools were selected because they are considered to be major requirements of a good farm workshop.

Table 29A: Comparison of sample and random selection as to farm workshop equipment.

	Welding equipment	Chain hoists	Power drills
Sample 887	46.9 %	34.05 %	60.20 %
Random 41	46.3	46.3	61.0

STANDING COMMITTEE

More of the farmers on larger farms report welding equipment, chain hoists and power drills indicating they have better farm workshops than have farmers on smaller holdings.

Table 29B: Distribution of farm workshop equipment to farm size

Total farmers by quarters	Percentage of farmers reporting		
	Welding	Hoists	Drills
1 18	16.67	16.67	38.89
2 110	33.64	22.73	45.45
3 126	29.37	30.46	47.62
4 192	36.98	30.73	58.33
5 114	49.12	36.84	65.79
6 97	55.67	35.05	59.79
7 63	61.90	28.57	82.54

Totals 887	46.90	34.05	60.20

30. Motor Mechanics and Machine Shop Training

Question 30: Do you have either technical machine shop or motor mechanics training: Yes ☐; No ☐.

Twenty per cent of the sample farmers and nearly 30 per cent of the farmers in the random selection have technical training in machine shop or motor mechanics.

Table 30A: Comparison of sample and random selection as to technical training

	Technical Training
Sample 887	20.18 %
Random 41	29.3

The survey shows no direct relationship between farm size and farmers having technical training in motor mechanics or machine shop.

Table 30B: Relationship of technical training to farm size

Total farmers by quarters	Percentage of farmers reporting Technical training
1 18	27.78
2 110	20.91
3 126	15.08
4 192	16.15
5 114	26.32
6 97	23.71
7 63	23.81
8 57	17.54
Over 8 110	20.90
Totals 887	20.18

More than a quarter of the farmers in Districts 4 and 8 have technical training motor mechanics or machine shop and more than 20 per cent of the farmers in Districts 1, 2, 10, 11, 14 have technical training.

Table 30C: Distribution of technical training by Wheat Pool districts

Total farmers by districts	Percentage of farmers reporting Technical training

Unident. 58	22.41
Totals 887	20.18

31. Machinery Company Manuals

Question 31: Do you think machinery manuals adequate ☐; need improving ☐; no good ☐.

If not adequate state why:

Seventy per cent of the sample farmers and 90 per cent of the random selection farmers consider that machinery company manuals need improving.

Table 31A: Comparison of sample and random selection as to machinery company manuals

	Manuals adequate	Manuals need improving	Manuals no good
Sample 853	28.1 %	69.3 %	2.2 %
Random 41	9.8	85.4	4.9

STANDING COMMITTEE

There is no direct relationship between farm size and opinion of farmers about the adequacy of machinery company manuals.

Table 31B: Relationship of opinion about machinery manuals to farm size

Farmers replies by quarters		Manuals adequate	Manuals need improving	Manuals no good
1	16	25.00 %	75.00 %	-
2	99	26.26	71.72	2.02 %
3	126	31.75	65.08	3.17
4	184	30.43	66.85	2.72
5	109	25.69	71.56	2.75
6	96	17.71	81.25	1.04
7	60	28.33	70.00	1.67
8	55	30.91	67.27	1.82
Over 8	108	32.41	62.96	4.63
Totals	853	28.14 %	69.28 %	2.58 %

More than 30 per cent of the sample farmers in Districts 2, 6, 7, 8, 9, 11, 13 and 15 consider machinery manuals adequate. The least satisfied farmers are in District 3 where only 17 per cent consider manuals adequate. Fewer than 20 per cent of the farmers in Districts 12 and 16 also consider manuals adequate.

Table 31C: Distribution of opinions about machinery manuals by Wheat Pool districts

Farmers replies by districts		Manuals adequate	Manuals need improving	Manuals no good
1	48	25.00 %	72.92 %	2.08 %
2	36	30.56	69.44	-
3	34	17.65	79.41	2.94
4	33	24.24	72.73	3.03
5	44	20.45	70.45	9.10
6	64	35.94	64.06	-
7	55	36.36	60.00	3.64
8	46	36.95	63.05	-
9	48	31.25	66.67	2.08
10	50	24.00	74.00	2.00
11	65	30.77	66.15	3.08
12	53	18.87	77.36	3.77
13	69	30.43	68.12	1.45
14	57	29.82	70.18	-
15	40	37.50	55.00	7.50
16	55	18.18	78.18	3.64
Unidentified	56	25.00	73.21	1.79
Totals	853	28.14 %	69.28 %	2.58 %

Their main complaint is that while manuals provide adequate maintenance instructions they do not give enough detail for overhaul and major repair jobs. Some say manuals would be of more use to farmers in the United States than in Saskatchewan. Some complain because manuals direct the farmer to see his dealer when he has a major repair and farmers consider many dealers not able to help them; in some cases dealers know less about the equipment than farmers do. Farmers suggest that manuals provide more diagrams and break-away drawings showing how to remove and replace hidden or difficult parts. Among those who find manuals adequate is a farmer in District 16 who operates a 16-quarter section farm. He said "Most manuals are adequate but farmers are not because they don't read them."

32. Suggestions for Improving Machinery Situation

Question 32:

What suggestion can you make to improve the farm machinery situation, either for new machinery sales and distribution or availability of parts and repairs? Do you have any comment to make on price of new equipment or repair parts?

** IF YOU NEED MORE SPACE FOR ANY OF THE OPINION QUESTIONS (23, 28, 31,32) please ATTACH ANOTHER SHEET OF PAPER. REMEMBER: DO NOT MARK YOUR NAME ON IT

The major complaint is that prices for machines and repair parts are too high. Of the total sample of 887, 758 farmers mention high price in their remarks. Nearly half of the sample complain about dealers not carrying enough parts for a long enough period of time. These two suggestions are mentioned by farmers in all 16 Wheat Pool districts as are additional proposals that machinery parts be standardized, that dealers provide better service, that there are too many models and that models are changed too often.

Twenty-five suggestions and complaints have been tabulated, citing the number of farmers mentioning each and the number of Wheat Pool districts represented by those farmers.

Table 32A: Compilation of 25 Major proposals and complaints with number of farmers citing each

<u>Suggestion or complaint</u>	<u>No. of farmers citing</u>	<u>No. of Wheat Pool districts citing</u>
1. Prices for machines, parts too high	758	16
2. Dealers should stock parts for longer periods	372	16
3. Parts should be standardized	95	16
4. Dealers should provide better service	94	16
5. Too many models and changes too often	83	16
6. More testing and better guarantees required	62	15
7. Farmers should support C.C.I.L.	34	11
8. Government should investigate prices	18	8
9. Farmers should buy more second-hand machinery	13	5
10. Government should control prices	12	6
11. Dealers should be able to repair machinery	11	2
12. Better guarantees and warranties needed	9	5
13. Farm Improvement Loans need improving	9	6
14. More training courses needed for farmers	9	6
15. More co-operation among neighbors	6	5
16. Machinery dealers should be more centralized	4	1
17. Implements should be manufactured in the west	3	3
18. Too many machinery dealers	3	2
19. Too much money is spent on advertising	3	3
20. Machines not built properly	2	1
21. Machines should be tested in the west	1	1
22. Machinery companies should advertise lowest prices	1	1
23. Too much government interference in price	1	1
24. Repair parts should be sold by weight	1	1
25. Too much centralization of dealers	1	1

If the suggestions and complaints are indicative of the general attitudes of all farmers in each of the districts some worthwhile observations may be made. For example, none of the farmers in Districts 1, 2 and 3--across the southern part of the province--complain about service now provided by machinery company dealers, but farmers in all of the other 13 districts do complain of this. None of the farmers in Districts 1, 2, 3 and 4 suggest that farmers should give greater support to Canadian Co-operative Implements Limited, the

farmer-owned machinery co-op, but farmers in each of the other 12 districts do. Few farmers in the south suggest that the Farm Improvement Loan needs improving, that there is need for more training courses in machinery repairs or that there should be more farmer co-operation in the use of machinery although these three proposals are advanced by farmers in nearly every district in the northern half of the province.

Table 32B: Distribution of the Suggestions or Complaints by Wheat Pool Districts

District and No. of farmers reporting from each		Prices for machines, parts too high	Dealers should stock parts for longer periods	Parts should be standardized	Dealers should provide better service	Too many models and changes too often	More testing and better guarantees required	Farmers should support C.C.I.L.	Government should investigate prices	Farmers should buy more second-hand machinery	Government should control prices	Dealers should be able and equipped to repair machinery	Better guarantees and warranties needed	Farm Improvement Loans need improving	More training courses needed for farmers	There should be more co-operation among farmers	Machinery dealers should be more centralized	Implements should be manufactured in the west	Too many machinery dealers	Too much money is spent on advertising machines	Machines are not properly built
1	50	45	14	2	-	1	2	-	3	4	-	7	-	-	-	-	-	-	-	1	-

9	51	48	25	6	4	6	7	4	3	-	-	-	-	1	3	2	1	1	-	-	-
10	51	47	23	7	7	5	3	3	3	-	-	-	-	1	1	1	1	1	-	-	-
11	65	57	30	2	5	4	3	1	-	-	-	3	-	-	1	-	-	-	-	-	-
12	55	44	21	10	10	7	4	1	-	-	1	-	1	-	-	1	-	-	-	-	-
13	70	59	31	9	12	11	2	4	1	-	-	-	-	4	2	-	-	-	-	-	-
14	60	50	25	10	6	8	3	5	-	-	1	-	-	1	-	1	-	-	-	-	-
15	44	38	13	8	3	4	4	3	-	-	-	-	-	-	1	-	-	-	-	-	-
16	56	46	29	5	7	2	5	1	-	4	-	1	1	1	1	-	3	-	-	1	-
Unid.	58	50	24	4	6	5	8	1	1	1	-	-	-	-	-	-	1	-	-	-	-
Totals	887	758	372	95	94	83	62	34	18	13	12	11	9	9	9	6	4	3	3	3	2

In addition, other proposals came from individual Wheat Pool districts on the following basis: Machinery should be tested in the west (District 1), machine companies should advertise their lowest price (District 1), there is too much government interference in price (District 6), repair parts should be sold by weight (District 6), and there is too much centralization of dealers (District 15).

Conclusions

Detailed conclusions based on analysis of this survey are contained in Volume I of this submission entitled "Views and recommendations based on findings of a survey among farmers." They indicate among other things that farm size and extent of production diversification contribute in a major way to the Saskatchewan farmer's current concern about his acquisition, maintenance and use of farm machinery. They also indicate, for example, that farmers with well-stocked farm workshops and some technical training in motor mechanics and machine shop techniques have different attitudes about and ability to use second-hand machinery and to make breakdown repairs on the farm. They also influence the farmer's opinion of the adequacy of present-day farm machines, manuals supplied by machinery companies and generally the operation of machinery company agencies.

Saskatchewan Wheat Pool hopes that this survey contributes some worthwhile detail for the parliamentary committee's investigation and that some of its data proves useful to the many farm machinery companies which operate in western Canada. The officials and directors of Saskatchewan Wheat Pool hope to be able to learn from this survey and others like it more about details of the problems which beset the farmers of Saskatchewan so that they might effectively recommend policies which will improve the state of the agricultural industry in the province and improve the economic and social community for farmers.

All of which is respectfully submitted,

SASKATCHEWAN WHEAT POOL

.....

Regina, Saskatchewan,
May 1961.

Appendix A

The following are the texts of three letters written by officials of Saskatchewan Wheat Pool in connection with the questionnaire forming the basis of this survey:

December 2, 1960.

To the Secretaries of Wheat Pool Committees:-

I am writing you about the attached questionnaire, which we are sending to you for completion. In January we expect to make a submission to the Agricultural Committee of the House of Commons in Ottawa, during its proposed investigation of farm machinery. We believe this an ideal opportunity to find out directly what farmers really think about the whole subject.

We are sending this to you in your capacity as Secretary of the local Wheat Pool Committee because we know you will understand, through your active work in the Wheat Pool organization, the importance of our getting the best possible reply from these questionnaires. If you are a Pool elevator agent, and do not operate a farm, we would appreciate it if you would ask the Chairman of the Committee to fill out the questionnaire. We have mailed 1,100 questionnaires, one to each Committee Secretary. A complete return would represent slightly more than one per cent of Saskatchewan's farming population. That number is low enough when you want representative opinion, and were it to fall much below that figure, any conclusions we might wish to draw from the returns might prove unsatisfactory.

The Parliamentary Committee has indicated it will likely start hearings early in the new year. We are most anxious to have the completed questionnaires in our hands not later than December 15th. This gives you about one week in which to complete the questionnaire and mail it back in the enclosed addressed envelope.

Most of the questions can be answered simply by making a check mark in the squares opposite each question. We are anxious to get full replies to all questions, but if there is any question you may not be able to answer, please do not hesitate to leave it blank and make replies to all questions you feel you can answer. The questions which provide larger space for your opinion about particular matters are important because they will give us some indication what you are thinking about farm machines and farm machinery companies. Do not hesitate to give us your fullest views on each. In addition, if you know of a particular instance where a farmer--yourself or someone else--actually has had a major dispute with a machinery company about a purchase or a repair item, we'd like you to report complete details on it.

If each Committee Secretary completes this questionnaire, we will be better able to prepare a submission on behalf of Pool members which might have a major influence on the work of the Parliamentary Committee. The views of an organization representing the largest group of Saskatchewan farmers will certainly be considered seriously in an investigation of this kind.

Many thanks for your co-operation,

Yours very truly,

A. R. Stevens,
Secretary.

REMEMBER: We need this questionnaire returned to Regina by December 15, 1960

MEMORANDUM TO ALL FIELDMEN:I M P O R T A N T

We have decided to circulate a questionnaire among some Wheat Pool people asking them questions which might be useful to us in the preparation of a submission to the standing committee on agriculture of the House of Commons which expects to be investigating the farm machinery situation sometime after the new year.

At the outset one questionnaire was sent to each of the 1,090 Wheat Pool Committee Secretaries for completion by themselves as farmers. A copy of the letter sent to them is enclosed for your information.

In addition we are sending you five copies of the questionnaires which we would like you to distribute to five individual farmers on the following basis: - Be sure that none of the five is at present a member of a Wheat Pool Committee and has not been a committee member for at least five years. We are anxious in seeking this kind of farmer to get information from people who are not at the present active in Wheat Pool affairs.

Whom you select is left to your discretion. We would like you to attempt to distribute them without consciously picking on the best, the most aggressive or the biggest farmers. One way of doing this would be to distribute a questionnaire to each of the first five farmers you happen to run into after receiving them. Another method would be to put in a hat separate slips of papers the names of all the farmers within easy reach that you happen to know and then distribute one questionnaire to each of the first five names you draw from the hat.

We are enclosing five stamped and self-addressed envelopes these five farmers should use to return the questionnaire to Head Office. If any or all of the five want you to help him fill in the replies that will be all right. But if any or all of them prefer to do it privately and send their own questionnaire directly to us that will be all right too. Whatever method is used, each questionnaire should reach us separately in a separate envelope for each and none of the farmers should sign his name or make any other mark on the questionnaire that will identify him. The only identity required is that noted in question No. 1 which is for him to state the Wheat Pool District and Sub-district in which his farm is located.

We have asked all committee secretaries to have their questionnaires in the mail to reach us by December 15. Would you plan to have your five farmers mail their questionnaires to reach us also by December 15.

There is no indication yet when the parliamentary committee will begin to meet. But press reports earlier seemed to indicate the investigation might begin early in January. After we receive all questionnaires there is considerable work ahead in analyzing them and then in preparing the submission. That is why we are asking that they all reach us by December 15.

Thanks for your early attention to this matter.

Director,
Country Organization Department.

December 7th, 1960.

Circular No. 50 - 1960 - 61

TO ALL AGENTS AND TRAVELLING SUPERINTENDENTS:

A few days ago we sent a questionnaire to all secretaries of local Wheat Pool Committees asking them to complete it and return it to Saskatchewan Wheat Pool head office by December 15th. The questionnaire was designed to give the Wheat Pool information on which to base a submission on behalf of Saskatchewan farmers to a proposed farm machinery investigation expected to be undertaken early in January by the standing agricultural committee of the House of Commons.

I am writing you today to tell you about the distribution of this questionnaire and to ask you to telephone or call on your committee secretary to remind him that we need his co-operation in completing the questionnaire and returning it to Regina by the deadline of December 15th. If you are yourself the committee secretary, then please consider this as a reminder to yourself that we are counting on your co-operation to complete this survey by the required date.

A. R. Stevens, Wheat Pool Secretary, wrote to all committee secretaries when the questionnaire was distributed, telling them about its purpose and the urgency for a quick response. Your reminder with the next day or two might be all that is needed to convince all secretaries that head office is counting on a 100 percent response to its request. The urgency is compounded by the approach of Christmas and the realization that if the parliamentary committee should decide to meet early in January, the completed submission must be ready when it is called for.

Your usual prompt attention to this matter will be greatly appreciated.

Yours very truly,

WJB/hm

W. J. Ball,
Manager,
Country Elevator Division.

Appendix B

The following is the full text of the questionnaire as it was produced for mailing. It was published by stencil on both sides of one sheet of paper.

DO NOT MARK			

QUESTIONNAIRE ON FARM MACHINERY

DO NOT MARK			

THIS QUESTIONNAIRE IS DESIGNED TO GIVE SASKATCHEWAN WHEAT POOL INFORMATION ON WHICH TO BASE A SUBMISSION TO THE HOUSE OF COMMONS STANDING COMMITTEE ON AGRICULTURE WHICH WILL HOLD PUBLIC HEARINGS EARLY IN 1961 TO INVESTIGATE THE FARM MACHINERY SITUATION. PLEASE ANSWER ALL QUESTIONS FULLY AND FRANKLY. NO ATTEMPT WILL BE MADE TO IDENTIFY YOU WITH ANY OF YOUR REPLIES AND THEY WILL BE KEPT IN CONFIDENCE.

MOST QUESTIONS MAY BE ANSWERED SIMPLY BY MAKING A ☒ MARK IN ONE OF THE SQUARES PROVIDED AFTER EACH QUESTION. PLEASE ANSWER ALL QUESTIONS. QUESTIONS 23, 28, 31 and 32 PROVIDE SPACE FOR YOU TO EXPRESS YOUR OPINION ABOUT CERTAIN MATTERS. DO NOT HESITATE TO GIVE US YOUR FULLEST VIEW.

1. Location of your farm: Wheat Pool District ☐ Sub-district ☐.
2. Size of your farm (in quarter sections); ☐ quarters.
3. Kind of farming operation: All grain ☐; All livestock ☐; mixed ☐.
4. Your land holdings: entirely owned ☐; entirely rented ☐; partly owned/rented ☐.
5. If under purchase, payments still being made: Yes ☐; No ☐.
6. Your farming experience: under 5 years ☐; 5-10 years ☐; 11-20 years ☐;
21-30 years ☐; 31-40 years ☐; over 41 years ☐.
7. Your education: Public School ☐; High School ☐; University courses ☐.
8. Your Age: 20-30 years ☐; 31-40 years ☐; 41-50 years ☐; 51-60 years ☐; over 60 ☐.
9. Do you live on the farm all year round ☐; part of year only ☐; not at all ☐.
10. Do you also have an off-farm job: Yes ☐; No ☐; Does your wife: Yes ☐; No ☐.
11. Have you held an elected position within the last five years in any local organization other than the Wheat Pool Committee: Yes ☐; No ☐.
12. Do you operate farm entirely alone ☐; with family ☐; hired help ☐; with both ☐.
13. If you have hired help, how many man-days did they work in 1960: ☐ man-days.
14. Estimated total current value of all your farm machinery owned: \$5,000 or less ☐;
\$5,-\$10,000 ☐; \$10,\$20,000 ☐; \$20,-\$30,000 ☐; over \$30,000 ☐.
15. Have you enough machinery for your operation: Yes ☐; No ☐; too much ☐.
16. Do you do custom work for others ☐; do others custom for you ☐; both ☐; neither ☐.
17. Do neighbors use your machinery ☐; do you use theirs ☐; both ☐; no sharing ☐.
18. Do you buy all your machinery new ☐; some new ☐; none new ☐.
19. Did you buy any new implements in any of the last three years: Yes ☐; No ☐.

IF YES: In 1960 were they valued under \$500 <input type="checkbox"/> ; \$500-\$2000 <input type="checkbox"/> ; \$2000-\$5000 <input type="checkbox"/> ; over \$5000 <input type="checkbox"/> .
In 1959 were they valued under \$500 <input type="checkbox"/> ; \$500-\$2000 <input type="checkbox"/> ; \$2000-\$5000 <input type="checkbox"/> ; over \$5000 <input type="checkbox"/> .
In 1958 were they valued under \$500 <input type="checkbox"/> ; \$500-\$2000 <input type="checkbox"/> ; \$2000-\$5000 <input type="checkbox"/> ; over \$5000 <input type="checkbox"/> .

20. Did you buy any used or second-hand implements in the last three years: Yes ☐; No ☐.

IF YES: In 1960 was it valued under \$500 <input type="checkbox"/> ; \$500-\$2000 <input type="checkbox"/> ; \$2000-\$5000 <input type="checkbox"/> ; over \$5000 <input type="checkbox"/> .
In 1959 was it valued under \$500 <input type="checkbox"/> ; \$500-\$2000 <input type="checkbox"/> ; \$2000-\$5000 <input type="checkbox"/> ; over \$5000 <input type="checkbox"/> .
In 1958 was it valued under \$500 <input type="checkbox"/> ; \$500-\$2000 <input type="checkbox"/> ; \$2000-\$5000 <input type="checkbox"/> ; over \$5000 <input type="checkbox"/> .

21. Did you get credit to buy machinery (new or used): from Credit Union ☐; Bank ☐; Finance Company ☐; family members ☐; others ☐; no credit needed ☐.
22. If you got loan to buy machinery, did you use Farm Improvement loan: Yes ☐; No ☐.
23. Are all your machines suitable for the job required of them: Yes ☐; No ☐.

If No give details

24. Inventory of your farm machinery owned (state number of each piece of equipment in space 'N' or 'U' indicating whether it was New (N) or Used (U) when purchased. If none leave blank)

Tractors	N <input type="checkbox"/> U <input type="checkbox"/>	Harrow	N <input type="checkbox"/> U <input type="checkbox"/>	Grain loaders	N <input type="checkbox"/> U <input type="checkbox"/>
Trucks	N <input type="checkbox"/> U <input type="checkbox"/>	Weed Sprayers	N <input type="checkbox"/> U <input type="checkbox"/>	Grain cleaners	N <input type="checkbox"/> U <input type="checkbox"/>
Automobiles	N <input type="checkbox"/> U <input type="checkbox"/>	Rod Weeders	N <input type="checkbox"/> U <input type="checkbox"/>	Grinder or hammer mills	N <input type="checkbox"/> U <input type="checkbox"/>
One-ways	N <input type="checkbox"/> U <input type="checkbox"/>	Combines	N <input type="checkbox"/> U <input type="checkbox"/>	Mower (hay)	N <input type="checkbox"/> U <input type="checkbox"/>
Diskers	N <input type="checkbox"/> U <input type="checkbox"/>	Swathers	N <input type="checkbox"/> U <input type="checkbox"/>	Rakes (hay)	N <input type="checkbox"/> U <input type="checkbox"/>
Cultivators	N <input type="checkbox"/> U <input type="checkbox"/>	Binders	N <input type="checkbox"/> U <input type="checkbox"/>	Hay balers or	
Seed Drills	N <input type="checkbox"/> U <input type="checkbox"/>	Threshers	N <input type="checkbox"/> U <input type="checkbox"/>	forage harvesters	N <input type="checkbox"/> U <input type="checkbox"/>
				Hay pickup	N <input type="checkbox"/> U <input type="checkbox"/>

25. How many times did you have a breakdown in 1960 you were NOT able to fix on farm ☐.
26. If any breakdown of any kind in 1960 how many days in total were you held up: ☐ days.
27. If you had to pick up parts how many miles did you travel to get them: ☐ miles.
28. _____

If more than one breakdown in 1960 give further details:

29. If you were able to repair breakdowns on the farm, do you have:
Welding equipment ☐; chain hoist ☐; power drill ☐.
30. Do you have either technical machine shop or motor mechanics training: Yes ☐; No ☐.
31. Do you think machinery manuals adequate ☐; need improving ☐; no good ☐.

If not adequate, state why:

32. _____

What suggestion can you make to improve the farm machinery situation, either for new machinery sales and distribution or availability of parts and repairs? Do you have any comment to make on price of new equipment or repair parts?

** IF YOU NEED MORE SPACE FOR ANY OF THE OPINION QUESTIONS (23, 28, 31, 32) PLEASE ATTACH ANOTHER SHEET OF PAPER. REMEMBER: DO NOT MARK YOUR NAME ON IT.

Clerk of the Committee.

MINUTES OF PROCEEDINGS

MONDAY, May 29, 1961
(24)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Argue, Boulanger, Campbell (*Lambton-Kent*), Clancy, Clermont, Fane, Forbes, Gundlock, Hales, Henderson, Hicks, Horner (*Acadia*), Kindt, Korchinski, McBain, Mandziuk, Montgomery, Muir (*Lisgar*), Nasserden, Noble, Peters, Rapp, Rogers, Slogan, Smallwood, Southam, Stefanson, Tucker, and Webb. (29)

In attendance: Messrs. G. G. Burt, General Vice-President, *Canadian Labour Congress* and Director, *U.A.W.*; C. Coburn, Assistant Research Director, *U.A.W.*; W. F. C. Kidd, Research Director, *United Steel Workers of America*; John Belligham, Chairman, *Farm Implement Council*, *Canadian Labour Congress*; Stanley Knowles, Executive Vice-President, *Canadian Labour Congress* and Dr. Eugene Forsey, Director of Research, *Canadian Labour Congress*.

The Chairman introduced Mr. Burt who, in turn, introduced the members of his delegation.

On behalf of the Canadian Labour Congress Agricultural Implement Committee, Mr. Burt presented their brief.

The Committee questioned the witnesses on the brief of the Canadian Labour Congress Agricultural Implement Committee brief.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING (25)

The Committee reconvened at 2.35 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Argue, Boulanger, Clancy, Clermont, Cooper, Doucett, Fane, Forbes, Gundlock, Hales, Hicks, Horner (*Acadia*), Kindt, Korchinski, Lahaye, McBain, Mandziuk, Muir (*Lisgar*), Nasserden, Noble, Peters, Slogan, Smallwood, Southam, Stefanson, Tardif, Tuckers, Villeneuve, and Webb. (29)

In attendance: same as at morning sitting.

The questioning of the witnesses on the Canadian Labour Congress Agricultural Implement Committee's brief was concluded.

On behalf of the Committee, the Vice-Chairman, Mr. Smallwood, thanked the witnesses for their appearance.

At 6.05 p.m. the Committee adjourned until 9.30 a.m. Friday, June 2nd.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

MONDAY, May 29, 1961.

The CHAIRMAN: Gentlemen, I believe we have a quorum and the meeting will come to order. Before we start our proceedings, Mr. Horner has a correction which he wishes to make.

Mr. HORNER: (*Acadia*): I should like to make a correction on page 716 of the report of our proceedings for May 19. At about the second paragraph on that page there is a question and I am reported as saying:

Massey's profits in 1954 when they were not incorporated as Massey-Ferguson.

That should read:

When they were incorporated as Massey-Ferguson.

The CHAIRMAN: Thank you, Mr. Horner. Gentlemen, this morning I am very pleased to welcome the Canadian labour congress who will present a brief from their agricultural implement committee. You may recall that these gentlemen were scheduled to appear before us several weeks ago and I know the committee regretted their not being able to be with us at that time. However, we are very pleased to welcome them here this morning, and I now introduce to you Mr. George G. Burt, who is the general vice president of the Canadian labour congress and the director of the U.A.W.

Mr. GEORGE G. BURT (*General Vice-President, Canadian Labour Congress, and Director of U.A.W.*): Gentlemen, on behalf of our agricultural implement committee I should like to express our regrets for any inconvenience we might have caused as a result of our request to have the date of our appearance changed. The reason for our request was that I had hoped to have the president of the congress with us this morning, but I have failed in that because he was too busy and had another assignment. I had him tied down until last week but still he was unable to come.

Our committee is actually a council. For many years we have had a council functioning in the agricultural implement industry, a council composed of representatives from each of the organized plants in Canada. The group you see at the back of the room—I may say I am not going to introduce them individually—are the members of the agricultural implement council, which is a standing council and committee of the Canadian labour congress.

At the top of the room, participating with me in these deliberations, are Mr. John Bellingham, from International Harvester's plant at Hamilton, who is chairman of the farm implement committee; Mr. Cleve Kidd, who is director of research for the united steel workers of America; Mr. Karl Coburn, who is assistant director of research for the U.A.W., and behind them we have Mr. Stanley Knowles. I think most of you know Stanley. He was in the House of Commons for many years and is an executive vice-president. With him is Doctor Eugene Forsey, director of research for the Canadian labour congress.

Gentlemen, I trust you all have copies of our memorandum. I am not sure if it has been the practice of your committee to follow summaries, but this document in itself is a summary. We are not facing you with the rather formidable documents that I understand you have been presented with since you started these hearings, and we have tried to stick strictly to the point we want to make, and to which we commend your concern and investigation.

The Canadian labour congress agricultural implement committee representing the workers in farm implement plants, appreciates this opportunity to appear before you. The price of farm implements is obviously a matter of great concern to farmers, and more and more so as farming becomes more and more mechanized. It is also a matter of great concern to farm implement workers, since needlessly high prices cut down the demand for our products, and this means less work and wages for us.

Farm implement prices, like nearly all other prices, have risen steeply since the end of the war. From 1947 (which we take as our base year, since 1946 was a year of reconversion) to 1960, the index of farm implement prices to the farmer has just about doubled: from 126.3 to 254.2 (1935-39=100; D.B.S. Price Index Numbers of Commodities and Services Used by Farmers).

Most of the increase in farm machinery prices took place between 1947 and 1952. The farm machinery (retail) price index increased 54.7 per cent in the five years from 1947 to 1952. This is over twice as much as the 27.1 per cent increase in the seven years from 1952 to 1959.

It is often alleged that the reason for this rise in prices is the rise in farm implement workers' wages. We propose, in this submission, to examine this allegation in the light of the facts revealed by official statistics, and also to suggest a possible alternative explanation which, we think, is more valid, and which we therefore suggest is better worth careful investigation by this committee.

Wages and Prices

It is not how much a worker gets per hour or per week that has a bearing on costs and prices, but rather how much he produces for what he gets. The price per unit of production is influenced by the wage cost *per unit* rather than by the wage rate *per hour*. And there are other costs (also per unit of output), such as material costs, salary costs, and capital costs, which also influence prices, perhaps more than wages.

Furthermore, high prices also cause high costs. Management price decisions imply output decisions. The maintenance of a managed or administered price requires control and restriction of production. When demand is declining, an administered price cannot be maintained or advanced unless output is effectively restricted.

As each firm's production falls below the level of optimum operating efficiency, unit wage costs, as well as other costs) will rise, even though hourly wage rates remain unchanged. The consequent rise in costs provides pressure for a further price rise.

Thus, at least some part of the rise in unit production costs for the farm machinery industry is due to management's price decisions and their effects upon the volume and efficiency of production.

Analysis of Cost Increases

Unfortunately, the dominion bureau of statistics is unable to provide us with sufficient data for a direct comparison of wage costs per unit of output with manufacturers' selling prices for farm machinery for the period since 1947. However, the available statistics are sufficient to show that the price increases to farmers were not primarily caused by the wage increases obtained by production workers.

A statistical analysis of costs in the manufacture of agricultural implements is difficult because no index of manufacturers' selling prices is available except for a very short period. However, two other price indexes are available. One is the index of retail prices paid by farmers, which of course can be affected by price changes of imported machinery and by changes in dealer mark-ups. The other is the index of export prices received by Canadian

manufacturers. Since, over the period studies, both of these indexes tended to move quite closely together, it is felt that they probably do represent as well as any other figures available, the movement of manufacturers' selling prices. We have, therefore, in the following analysis used the D.B.S. index of retail prices to adjust the figures for dollar value of production and obtain data on physical volume of production.

As will be shown later, there is evidence which suggests that retail prices have risen faster than manufacturers' selling prices due to a widening of distributors' price spreads. To the extent that is true, all manufacturing costs, including wage costs, have contributed less to the rise in prices paid by farmers than the following calculations would suggest.

This table shows the distribution of the sales dollar in the agricultural implement industry in 1947, 1952 and 1958. I might say we stress the period from 1947 to 1952 because that was the period of greatest expansion and greatest development in the industry. It and the other tables are explained as we go along.

TABLE 1
DISTRIBUTION OF THE SALES DOLLAR
THE AGRICULTURAL IMPLEMENTS INDUSTRY,

⁸ Value Added Index divided by Total Man-hours Index (7), and multiplied by 100.

Prices and Wage Costs: 1947-1958

Between 1947 and 1958 the industry's gross selling value of output increased by 56.3 per cent. This was due to a price rise of 87.4 per cent, offset by a 16.6 per cent decline in volume of production. (See Table 2).

The total wages paid by the industry rose by \$8.1 million, or 31.4 per cent, from \$26.0 million to \$34.1 million. But for the \$8.1 million more paid out in wages the industry got \$50.4 million more production value (up from \$89.4 million to \$139.8 million). Thus, the wage share of the industry's sales dollar was reduced from 29.1 cents in 1947 to 24.4 cents in 1958. (See Table 1). There was little change in the shares paid for materials (down from 55.7 cents to 55.3 cents) and for fuel and electricity (down from 1.6 cents to 1.4 cents). However, much larger shares of the sales dollar went to salaries (up from 5.9 cents in 1947 to 9.4 cents in 1958) and to "non-specified costs and profits" (up from 7.7 cents to 9.5 cents).

It would be somewhat remarkable if there had not been some wage and other cost increases after 1947, considering the general demand inflation which followed the removal of wartime price and wage controls. Workers' living costs increased sharply, and if wages had not been increased, their living standards would have been reduced in a period of generally rising productivity and standards of living.

However, as the analysis will show, price increases were far in excess of those which could be justified by the relatively small increase in wage costs.

In the 1947-1952 period particularly, the sharp increase in demand for farm machinery in both the domestic and export markets enabled the manufacturers to raise their prices well beyond the levels justified by the increasing costs, as is shown by the very substantial increase in their profits.

Following 1952 the fall in farm income in Canada and the United States produced a sharp decline in volume of agricultural implement sales, especially since the manufacturers failed to meet the decline in volume with cuts in their already inflated prices. The result was an increase in wage costs per unit of production which is less attributable to increases in hourly wage rates than it is to the less efficient use of labour which almost inevitably results from declines in production.

Nevertheless, the 57.6 per cent rise in unit wage costs from 1947 to 1958 accounts for only a relatively small portion of the 87.4 per cent price rise. If unit wage costs had been held at the 1947 level, farm machinery prices in 1958 would still have been at least 70.7 per cent higher because of the increases in other costs and profits. Even if the total 87.4 per cent price increase had been the result of higher manufacturing costs, higher wage costs would have accounted for only 16.7 per cent; higher salary costs, 11.8 per cent; higher material costs, 48.0 per cent; higher fuel and electricity costs, 1.0 per cent; and non-specified costs and profits account for 9.9 per cent. (See Table 3).

(It should be emphasized again that the following calculations assume no increase in dealer price spreads; to the extent that price spreads did increase, wage and other manufacturing costs contributed less to the rise in prices than these figures would suggest.)

¹ Assuming no change in dealer price spreads.

SOURCE: Data of Tables 1 and 2

Column (a) of table 3 shows how the sales dollar was divided in 1947: 29.1 cents for wages, 5.9 cents for salaries, 55.7 cents for materials, 1.6 cents for fuel and electricity, and 7.7 cents for other costs, including profits.

Column (b) shows how the cost of each of the above items per unit of output increased percentagewise between 1947 and 1958. Their combined effect, including that of profits, was to increase prices by 87.4 per cent so that equipment which sold for \$1.00 in 1947 sold for \$1.874 in 1958.

Column (c) shows how costs for the same piece of equipment were distributed in 1958. Wages had gone up from 29.1 cents to 45.8 cents, salaries from 5.9 cents to 17.7 cents, materials from 55.7 cents to 103.7 cents, fuel and electricity from 1.6 cents to 2.6 cents, and non-specified costs and profits from 7.7 cents to 17.6 cents.

Column (d) shows simply the difference between the costs in 1947 and the costs for the same item in 1958. As far as wages are concerned, the significant fact is that out of a total cost increase of 87.4 cents, only 16.7 cents, or less than one-fifth, was attributable to wages. With no wage increases at all, costs could still have gone up 70.7 cents in the dollar.

The other fact of importance, which is brought out in column (b) of the table, is that percentagewise, wage costs per unit of output rose less than any other item, and far less than costs for salaries or the "non-specified costs" item which includes profits. Compared with the 57.6 per cent rise in wage costs per unit of output are unit cost increases of 201.0 per cent for salaries; 86.1 per cent for materials; 60.7 per cent for power; and 128.7 per cent for non-specified charges and profits. If we had data on dealer price spreads all the above figures might be reduced, but the wage cost would still show the smallest percentage increase.

The figures can be analyzed in another way, using the data of table 1. From 1947 to 1958, as noted above, gross selling value of production rose 56.3 per cent. Taking out the value of raw materials, fuel and electricity, we get the value added by this manufacturing industry.

This "value added" rose almost 59 per cent, while the total wage bill rose only 31 per cent. In 1947, wages made up 68 per cent of value added; by 1958 the percentage had fallen to 56. In 1947, for every \$1 of wages he paid, the employer got back \$1.47 in value added; by 1958, for every \$1 of wages, he got back \$1.77 in value added. Take a further comparison. Average hourly earnings of wage-earners rose 103.2 per cent; but value-added per man-hour rose 145.1 per cent. (The 103.2 per cent increase in average hourly earnings for the farm machinery industry compares with an increase of 104.5 per cent in durable goods manufacturing and 106.8 per cent in non-durables, between 1947 and 1958).

TABLE 4

AGRICULTURAL IMPLEMENTS INDUSTRY, AVERAGE NUMBER OF
EMPLOYEES, 1947, 1952 AND 1958

	Average Number of Employees:		
	On Salaries	On Wages	Total
1947.....	2,325	13,688	16,013
	Supervisory and Office	Production Workers	
1952.....	3,293	14,753	18,046
1958.....	2,655	8,356	11,011

SOURCE: D.B.S. *The Agricultural Implements Industry*, annual reports

The volume of output per man-hour went up 28.9 per cent between 1947 and 1958; this includes a gain of 32.3 per cent from 1947 to 1952, offset by a decline of 2.6 per cent from 1952 to 1958 when volume of production was declining.

Between 1947 and 1958, the number of salaried employees increased 14.2 per cent and the number of wage earners declined 39 per cent. Total man-hours (for wage earners) dropped by 35.3 per cent.

Prices and Wage Costs: 1947-1952

The above evidence is sufficient, we think, to establish the fact that over the entire period since 1947 wages were a very minor factor in the increase in prices in the agricultural implement industry. However, this is even more clearly evident if we consider separately the period from 1947 to 1952. This may seem like going back a long way. But this is the period in which the greatest part of postwar price increases took place—a 54.7 per cent increase between 1947 and 1952, compared with a 27.1 per cent increase between 1952 and 1959. In addition, as we pointed out earlier, the effect of wages on total costs is blurred after 1952 because a great deal of the increase in wage costs per unit of production is due to the fact that production was falling, rather than to any increase in actual wage rates.

Table 5 shows the data presented in the same way as in Table 3, but covering the period 1947 to 1952 only.

TABLE 5
THE AGRICULTURAL IMPLEMENTS INDUSTRY
CHANGES IN COSTS PER UNIT OF OUTPUT AND CHANGES
IN THE DISTRIBUTION OF THE SALES DOLLAR
1947-1952¹

	Distribution of the Sales Dollar 1947	Costs per Unit of Output: 1952 as % of 1947	Distribution of the Sales Dollar 1952 (1947 as 100)	Distribution of the 1947-1952 Price Increase
	(a)	(b)	(c) = (a) × (b)	(d) = (c) - (a)
Wages	29.1¢	128.6%	37.4¢	8.3¢
Salaries	5.9¢	162.6	9.6¢	3.7
Materials	55.7¢	148.3	82.6¢	26.9¢
Fuel and Electricity	1.6¢	99.8	1.6¢	0
Nonspecified costs and profits	7.7¢	304.8	23.5¢	15.8¢
Total Price (Cost)	100.0¢	154.7%	154.7¢	54.7¢

¹Assuming no change in dealer price spreads
SOURCE: Data of Tables 1 and 2

As the table shows, the price of an item that cost \$1 in 1947 had increased by 1952 to \$1.547. Of the 54.7 cents increase, only 8.3 cents could be attributed to wages, 3.7 cents to salaries, 26.9 cents to materials and 15.8 cents to non-specified costs and profits.

Referring back again to the data in table 1 and table 2, between 1947 and 1952, gross value of production gained 130.1 per cent, due to a 54.7 per cent rise in prices combined with a 48.7 per cent rise in volume. But while

production value rose 130.1 per cent the total wage bill increased only 91.3 per cent, and the wage share of the sales dollar dropped to 24.1 cents from 29.1 cents.

By comparison, "nonspecified costs and profits" showed a jump of 353.8 per cent in the annual total and 204.8 per cent per unit of production. This residual cost category doubled its share of the sales dollar from 7.7 cents in 1947 to 15.2 cents in 1952.

The D.B.S. figures do not separate out the companies' profits from "nonspecified costs". But the Department of National Revenue in its *Taxation Statistics* does publish not only profits of the agricultural implement companies, but data which enable us to calculate the net worth, or value of the stockholders' equities in the companies. The companies covered are probably not exactly the same as those included in the D.B.S. figures, but the major companies are presumably in both lists.

The National Revenue figures show that profits of the companies increased from just under \$17 million in 1947 to over \$40 million in 1952. What is even more significant, this represented an increase in return on the stockholders' equities from 16.9 per cent in 1947 to 25.7 per cent in 1952, in spite of the fact that the 1947 figure excludes companies that lost money while the 1952 figure includes them.

Obviously during this period, prices were not being pushed up by wage costs, but rather they were being pulled up by a rising demand, which enabled the companies to raise both their prices and their profits.

When demand rises faster than supply, prices rise, even while production costs may remain relatively stable. Cost increases follow the price increases. Between 1947 and 1952 farm machinery prices rose 54.7 per cent in response to sharp and quick demand expansion in both the domestic and foreign markets.

Prices and Wage Costs: 1952-1958

During 1952-1958, gross value of production declined 32.1 per cent. Prices rose 21.1 per cent in spite of, and partly because of, a 43.9 per cent drop in volume of production.

The price inflation of this period was certainly very much different from the previous period. Between 1947 and 1952 demand for farm machinery was increasing more strongly and quickly than the supply. The upward pressure on prices came primarily from a pressing demand. The producers charged more because they could get more—and the farmers could pay more because of their higher cash incomes. After 1952, demand declined, but supply declined even more, and prices continued to rise—21.1 per cent to 1958. This is much less than the 54.7 per cent price rise between 1947 and 1952, but more surprising, considering the declining demand and an enlarged production capacity. Reduced farm cash incomes and rising farm machinery prices are probably major causes for the decline in farm equipment production. Restriction of output at less than optimum efficiency levels causes costs to rise. If volume had been maintained in 1958 at a higher rate of operating capacity, output per man-hour most likely would have been greater and unit wage costs would have been lower.

Considering the 43.9 per cent drop in volume of production, it is quite remarkable that unit wage costs did not rise much more than 22.6 per cent. Average hourly earnings rose 19.4 per cent between 1952 and 1958, compared with the 70.2 per cent 1947-1952 rise. Value-added output per man-hour, however, increase 41.6 per cent. In 1952, wages represented 67 per cent of value added; by 1958, the share had fallen to 56 per cent.

The 22.6 per cent rise in unit wage costs is equivalent to a 5.4 per cent rise in prices. Thus, even if there had been no change in wage costs since 1952, prices would still have been at least 15.7 per cent higher (instead of 21.1 per cent) in 1958, because of the rise in the other costs.

What the Price Indexes Show

The question of the relation between wages in the Canadian agricultural implement industry and the prices Canadian farmers pay for their agricultural implements is, however, we submit, of minor importance. The reason for this startling statement is that the bulk of the farm implements used in Canada are imported (chiefly because so few tractors are produced here), while more than half of the Canadian production is exported. The Canadian farmer, therefore, is really more concerned with the prices of American farm implements than with those of Canadian farm implements. We suggest, therefore, that this committee might well investigate the relationship between the price at which American implements come into this country, or Canadian implements sell at the plant, and the price at which they reach the Canadian farmer. There is strong evidence to suggest that in recent years much of the increase in price that Canadian farmers pay for both has been due to an increase in distribution costs.

Three indexes of prices of agricultural implements are available for the period 1947-1959, and a fourth for a shorter period.

The first is the farm machinery price index which is a component of the price index of equipment and materials used by farmers, itself a component of the price index of commodities and services used by farmers. This is published three times a year in the D.B.S. *Price Index of Commodities and Services Used by Farmers*. The farm machinery price index is, of course, an index of retail prices to farmers. It is based on list prices for dealers, and therefore does not reflect any discounts or trade-in allowances dealers may allow to farmers.

We have been informed that these discounts and allowances have been increasing in recent years. If that is the case, the actual price increase to farmers has not been as great as the index shows. We feel the committee might well look into this matter.

The second index is the index of import prices of farm machinery. This is the United States index of wholesale prices of farm machinery and equipment, adjusted for changes in the exchange rate. It is based on prices f.o.b. factory, and therefore does not reflect movements of freight and other charges which would be contained in import prices on this side of the border.

The third index is the index of export prices.

The third need not particularly concern us here. This committee is not worried about what the American farmer pays for Canadian implements, and could not do much about it if it was. It is not without interest, however, that the index of export prices, which, of course, are wholesale prices, has moved up in almost exactly the same degree as the domestic retail price index over the whole period 1947-1959. In 1956, for example, the export price index on the base 1947=100 was 166.6, and the domestic retail price index 165.8. In 1957, the corresponding figures were 178.1 and 177.2. In 1958, they were 188.3 and 187.4. In 1959, they were 197.8 and 196.7. It is really astonishing that the movement of domestic retail prices, which are mainly prices of imports, should so closely parallel the movement of export wholesale prices.

Our astonishment deepens when we compare the movement of domestic retail prices with that of wholesale import prices. In the first few years after 1947, the two were fairly close together. But in 1951, the spread between them widened markedly, and in 1952 even more so; and it has stayed very wide ever since. In 1956, for example, the import price index was 136.3, on the base 1947=100, while the domestic retail index was 165.8. In 1957, the corresponding figures were 138.3 and 177.2. In 1958, they were 146.4 and 187.4. In 1959, they were 149.9 and 196.7.

In other words, the retail price of farm implements appears to have gone up just about twice as fast as the wholesale price of imported implements which make up the greater part of retail sales. Between 1947 and 1959, import prices went up 49.9 per cent, but retail prices went up 96.7 per cent.

A further piece of interesting evidence is supplied by the agricultural implement industry selling price index made available just a few weeks ago by D.B.S. for the years from 1956 to 1959. This is an index of Canadian manufacturers' selling prices, and we would have used it in place of the retail price index in our earlier analysis, except that it is not available for years before 1956.

This new index shows that between 1956 and 1959 Canadian farm implement manufacturers' selling prices increased by 10.1 per cent. In the same period the retail price paid by Canadian farmers increased by 18.6 per cent however.

For convenience, table 6 shows all three indexes for the period, on the base 1956=100.

TABLE 6

INDEXES OF MANUFACTURERS' SELLING PRICE, IMPORT PRICE
AND RETAIL PRICE, AGRICULTURAL IMPLEMENTS, 1956-1959
(1956=100.0)

Year	Manufacturers' Selling Price	Import Price	Retail Price
1956	100.0	100.0	100.0
1957	103.8	101.5	106.9
1958	108.2	107.4	113.0
1959	110.1	110.0	118.6

Source: D.B.S.

In other words, the prices of Canadian-made implements at the plant increased by 10.1 per cent, and the price if imported implements at the border increased by 10.0 per cent, yet the prices paid by Canadian farmers for these implements apparently increased by 18.6 per cent. We doubt that transportation costs have increased enough to account for more than a fraction of the difference.

These comparisons do not constitute proof that there is a price spread of this size, as the content and weighting diagrams of the three indexes may well be very different. Neither do they prove that the dealers are making inordinate profits, or that the system of distribution is inefficient. As we noted earlier, the retail price index does not take into account discounts and trade-in allowances, which may well have been increasing under competitive pressure. This would mean, of course, that dealers had simply been increasing their mark-ups to compensate for the increased discounts or allowances so that farmers who thought they were driving hard bargains may really have been getting no bargains at all. This may not seem very ethical, but it has been known to happen in other industries also.

Any or all of these factors may account for the wide gap between manufacturers' and import prices on the one hand and retail prices on the other. But the gap is there, and it strongly suggests the possibility that profiteering or inefficient distribution or other causes may be pushing distributors' mark-ups steadily higher, and that this may be an important reason why farmers have to pay more for agricultural implements than they should. At any rate, there seems to be a strong *prima facie* case for investigation by this Committee.

I think you will note, gentlemen, that one of the things that concerns us is this constant assertion—and it is done in the press, radio and every other public outlet as well as in statements by people who apparently have not got the facts—that one of the chief reasons for the rise in cost of implements is because the big bad unions are constantly forcing up wages. We have attempted here to prove that there are other factors besides wages that contribute to increases in prices and that would bear the scrutiny of this House of Commons committee. We have put in considerable work in our brief in relating it to the available statistical figures published by D.B.S., and we hope you will give it your earnest consideration and that our contribution to the committee will be worth while.

The CHAIRMAN: The meeting is open for questioning.

Mr. HORNER (*Acadia*): Mr. Chairman, my first question deals with table 1 on page 3. I notice there that in the year 1958 you have added to the gross selling value of production the inventory figure of \$6,625,161. Was this inventory added to 1952 as well as to 1947?

Mr. CARL COBURN (*Assistant Director of Research, United Automobile Workers, Windsor*): I do not believe this is the way D.B.S. calculates the figures, and I believe it was some time after 1952 that they adopted the process of revising their figures by taking into account the inventory.

Mr. HORNER (*Acadia*): I would like to point out to the committee that I have before me the 1958 *Agricultural Implements Industry* publication put out by D.B.S. In that particular publication for 1958 they have not added inventory. The total gross is \$143 million, and down below the inventory is taken into consideration. I see where they get their \$6 million. My point is this, that inventory was not added in 1952 and it was available in the *Agricultural Implements Industry* for 1952. There is again inventory for that year of over \$5 million, according to figures out of the 1952 *Agricultural Implements Industry* publication. I hope members will agree that it would perhaps be better to compare three years, either using inventory for all the three years or leaving the inventory out in all the three years. Do you agree with that?

Mr. COBURN: I think it would be desirable to do it that way. The figures we had available to us did not seem to present themselves in that way. We may have slipped up in our calculations.

Mr. HORNER (*Acadia*): As I read them out of the publication, the figures are there quite clearly. An inventory is not added unless you care to add it in. I would like to point out to the committee that if inventory is left out of 1958 and percentages are worked of the gross selling value of production, and using the figure of \$133 million rather than \$139 million, as you will see at the bottom of that chart, the wage percentage is 25.64 rather than 24.4 per cent. The salaries percentage is 9.91 rather than 9.4. The materials percentage is 58.03 rather than 55.3; the fuel and electricity percentage is 14.7 rather than 14, and the important one—I want to emphasize this—other costs and profits is 4.95 per cent rather than 9.5 per cent. This is where the important part comes in; the other costs and profits, leaving the inventory out, are reduced roughly 3½ points. To verify my figures and calculations, in the Saskatchewan brief, at the back—I do not know whether too many members looked at it—they worked out the gross profit in the *Agricultural Implements Industry* using D.B.S. figures. They worked out the various profits, leaving inventory out, I presume, and for the year 1958 the gross operating profit is a percentage of the gross selling value. I am reading from page 681 of the committee proceedings. They have the percentage worked out to 4.9 rather than 9.5 for the year 1958. This verifies my own figure of 4.95. I have worked it out to one further decimal place. This changes the whole context here.

Mr. COBURN: Mr. Horner, the point is that if you leave out the inventory increase you get, as you pointed out, a much lower value for other costs and profits simply because you are not taking into consideration the value of the inventory which the manufacturers had in their plants. This was certainly something they had produced and which they had; it was part of their property and required to be taken into account. If it had been possible to present figures for all three years with inventory it would have been done, but the figures were not available. We did not feel that it would be proper to present figures which gave only a partial picture, when D.B.S. for that year was able to give us figures which presented the whole picture.

Mr. HORNER (*Acadia*): All I said was: would it not be better to take all of them one way or the other?

Mr. COBURN: It is better to take the most accurate figures.

Mr. HORNER (*Acadia*): In reading the 1952 agricultural industry statement on page 1—this is D.B.S., I obtained it from the parliamentary library. Anyway, I have them here and I want to read this out. It says:

Inventory value of finished products—

This is for 1952, and I maintain you have not included it in 1952. You have not included it in 1947 either to my knowledge; so I think you should not have included it in 1958. That is all I am saying. This continues:

Inventory value at the end of 1951—

—which we would assume would be the beginning of 1952—

—amounted to \$6,156,000; and at the end of 1952, inventory was valued at \$11,392,000.

There you have a gain in inventory of over \$5 million—roughly \$5,200,000. If this was not added to the \$205 million in your gross selling value of your table—and these figures were available, as I picked them out at the library; percentage is only a comparison. That is all I say. I am not saying if profits have decreased or increased; but in drawing a comparison between the three various years, one should use similar figures.

Mr. COBURN: I agree we would have done better to have included that inventory figure for 1952. I do not know how it was we happened to miss that out, but we did. That would have given you an increase of your value added by the manufacturer to roughly \$210 million, instead of \$205 million. No, I am sorry—your gross selling value of production and value added by manufacturer would have gone up to about \$79 million, and the percentages would have been affected accordingly.

Mr. HORNER (*Acadia*): I agree it should have been in, but I have failed to find inventory for 1947 in the D.B.S. figures. It is not given for 1947. Therefore, if you are going to use it for 1947, I would say it should not have been left out completely. You are using 1947 as a base.

Mr. COBURN: You have this problem constantly in regard to statistical material. The D.B.S. and other agencies which cover it are refining and improving their methods constantly. Where that refining consists of getting a more accurate figure, it seems to me that it would not be sound practice deliberately to distort that figure to make it less accurate, just so that it compares with some earlier year.

Mr. HORNER (*Acadia*): If you are drawing a comparison with this earlier year, you should use like figures. That is all I am saying. Would you not agree with that?

Mr. COBURN: I agree that is generally sound.

Mr. HORNER (*Acadia*): All right. For this comparison, if inventory is not given for 1947, it was given for 1952, and is not used, so there is no logical reason why it should be, for this comparison, included in 1958.

Mr. COBURN: Except that if you do not include it your figures are simply that much less accurate.

Mr. HORNER (*Acadia*): But if you do include it in drawing a conclusion in regard to the figures in which it was used, your figures are also not correct. Then you are not comparing like things.

Mr. COBURN: You are comparing them as closely as you can get.

Mr. HORNER (*Acadia*): No, you are not comparing them as closely as you can get. You are comparing it just the other way around.

Mr. KINDT: It is quite evident that there is bias in that statement, and that the committee should throw out that table for any consideration. You cannot compare like things unless they are made like. When the figures are compiled on different premises, the end result cannot be compared when it is translated into percentages.

Mr. COBURN: All I can say is that if you are going to throw out all figures because there has been some change in the manner of calculation at D.B.S., in the exact manner in which they give it, you find you have no figures at all.

Mr. NASSERDEN: I think that is exactly what the committee think. We have not got any figures here. We have not got a true consistent comparison, and if we have not got that, it serves no useful purpose.

Mr. HORNER (*Acadia*): I do not think the table has to be thrown out. I have read off my calculations and if the gentlemen here want to check them during the lapse of time between this meeting and the next, I would think this may be done, and they might bring in, perhaps, a better comparison between the years 1947 and 1958, using the year 1958 without that value of inventory added. I think it would change a few figures in the explanation of the table. For example, on page 5, for non-specified costs and profits, shown there as being up from 7.7 cents to 9.5 cents, they would be down from 7.7 cents to 4.95 cents, according to my figures. That would make a change throughout, there. These gentlemen have gone to a lot of work to present this table, and in presenting it; and I would not suggest that we throw it out absolutely.

Mr. COBURN: I would like to point out that the point we are most concerned about in table 1 is the percentage that wages represent of the gross selling value of production. As Mr. Horner has pointed out, this change would be a very small amount, from 24.4 to 25.64. That is a relatively small change and it maintains the relationship which is there in wages between 1947 and 1958, that wages declined substantially as a proportion of total costs. Even if the figures are slightly changed, the basic point remains the same.

Mr. HORNER (*Acadia*): Material has made the biggest jump from 1955 to 1958, roughly speaking.

Mr. BOULANGER (*Interpretation*): It seems to me that Mr. Horner has a point, because if we take out table 1, the following figures shown in that brief will probably have to be modified. I believe I am justified in suggesting we should revise the figures so as to give a brief in which the figures will be consistent throughout.

The CHAIRMAN: Mr. Coburn, during our recess, before we meet this afternoon, could you revise this table, using the statistics Mr. Horner has quoted so that there would be a proper comparison?

Mr. COBURN: I could endeavour to look at the figures. I presume I can get the statistical material from the parliamentary library. I say that if that is done, the comparison will be much less accurate.

Mr. HORNER (*Acadia*): It will be more accurate.

Mr. COBURN: This is a matter of interpretation.

Mr. KORCHINSKI: On page 6 you have another table which has a relation to table 1. You are multiplying (a) times (b), that is to say, 29.1 cents multiplied by 157.6 per cent, giving you 45.8 cents. If you use the proper relationship for distribution, your end result will be different again. Therefore, this whole brief is really distorted. If you check through it closely, you may find there are other similar examples. One page relates to the next. If you start from the first table, and find there is a discrepancy in that one, I do not know how one is going to assess this properly at all.

Mr. COBURN: I still submit that the figures will be more distorted.

Mr. KORCHINSKI: I submit this will be distorted.

Mr. MANDZIUK: Are they not distorted now?

Mr. COBURN: The increase in the inventory represents goods which have been produced. It represents increased value, which is in the manufacturer's pocket. If you say you are not going to take that into account, that you are going to pretend he did not manufacture those goods, you are simply distorting the figures. It is quite true that for 1947 you had to do that, because D.B.S. simply did not obtain that information. But it seems to me that does not justify you in taking the process down the years when the information is available. I will be happy to make a correction for 1952, where apparently the information is available.

Mr. HORNER (*Acadia*): If you are going to use 1947 as a base—and you are using 1947 as a base in table 2—and if in table 2 you are using the figures you have presented in table 1, 1947 has not got inventory figures available, so all I can say is that inventory should remain relatively constant. The gain in inventory should remain relatively constant—in 1952 a gain of \$5 million; in 1958, a gain of \$6 million. Therefore, I think a figure which remains relatively constant could be very easily left out, particularly in a comparison. We are not trying to arrive at exact profits or exact expenditures in wages. What we are trying to do is draw a comparison.

Mr. COBURN: What happens if you leave inventory out all along is that you deflate the profit figure by the total amount of that inventory, because you pretend that is something the employer does not have.

Mr. HORNER (*Acadia*): The profit figure, because of leaving inventory out, would be deflated to a certain percentage, I agree; but it would be deflated in every case, more than likely, the same; so we can only say this profit figure—

Mr. COBURN: Not necessarily. I do not know what happened to the inventory each year, but I think it is common experience that inventory goes up in some years, and goes down in others. You cannot assume the same increase in inventory every year. If you can assume it and simply say you are going to leave it out, then you would be saying you are going to lop off \$5 million profits of this industry each year, and not take them into account.

Mr. HORNER (*Acadia*): All I am saying is that you are using 1947 as a base. The value of inventory is not available for 1947, as far as I know—and apparently you were not able to find it either. It is available for 1952, and apparently you were not able to find it either. It is available for 1952, which you never used. And it is available for 1958, which you did use. All I am saying is that you should have used inventory in all cases, or you should not have used inventory in all cases. It was not available for the base year you chose, and therefore I think it should not have been used in either of the other years. That is all.

Mr. COBURN: I would suggest that the reason D.B.S. put that inventory figure in as soon as they were able to get it was because they realized that the figures were much less satisfactory without it.

Mr. HORNER (*Acadia*): I would like to point out to the committee, Mr. Chairman, that in the 1958 *Agricultural Implement Industry Report*, catalogue 42-202, on page 6, table 1 gives the principal statistics of the agricultural implement industry, and table 2 is an altogether different table on the same page which gives you the inventory in raw materials and processed goods for various provinces throughout Canada, bringing a total for the beginning of the year 1958 and the closing of the year 1958. Therefore, I suggest that inventory is an added figure to the D.B.S. figures for the year 1958. It is not in the original table setting out the gross selling value of production in table 1 of the D.B.S. figures.

Mr. W. S. CLEVE KIDD (*Director of Research, United Steelworkers of America*): At this point, there is a difference of opinion on interpretation, but we will have to reassemble this table. It seems to me—I was not in on the original—that the figure for 1947, which is the gross selling value of production, may well be a figure including inventory. On re-examination we can find out if this is so; and if this is so, we will be back to the position that our original calculations were correct. There is a difference between the value of production and the value of factory shipments. It may well be that, as the D.B.S. find, these figures include the factory shipments plus inventory. They are probably included in the original figures, or the original total value of production.

Mr. SLOGAN: I think our trouble stems from the fact that there has been a change in the D.B.S. index—I believe it was in 1949—and when we look at other figures we usually get the comparison range, 1949 to 1960. I think that by going back before 1949 you are comparing two entirely different sets of figures. On page 1 you use 1935-1939 equal to 100, but I think that figure was revised in 1949. Therefore, I think all these comparisons are somewhat distorted. We have learned from various briefs that from 1949 to 1960—and various briefs have corroborated this—the percentage of profit in the farm implement industry has been an average of 3 per cent. I think that if you deduct the non-specified costs from the profit column you will find this to be accurate. I would suggest that this whole brief is pulling the wool over our eyes, and I suggest we adjourn until you can use a comparison of 1949 to 1960, which I think would be valid. Once you go back before 1949, you come up against trouble, because the whole index is changed, and then all we are doing is picking holes in the figures. I do not think it will be accurate to any extent.

Mr. COBURN: The fact that the indices were changed to a 1949 basis instead of a 1935 to 1939 basis does not interfere with the validity of comparisons at all.

Mr. SLOGAN: Yes, because there are different items used as the index.

Mr. COBURN: Yes, but D.B.S. made all the necessary adjustments to enable you to put these things together. If you go back only as far as 1949, what will happen is that you are simply omitting two of the years in which the farm implement industry made some of its largest profits.

Mr. SLOGAN: Is not that what you are doing? You are taking the period 1947 to 1952. This adjustment period is right in the middle of that period, so it will give some true reflection of what happened in 1947 to 1952. However, we are more interested in what is happening in 1961. We have to compare with the past in order to get a true picture, but the type of comparison which you have given here is completely misleading.

Mr. COBURN: The point is that all the figures indicate that between 1947 and 1952 there was a very substantial increase in the price of farm implements. That was when the major increase took place. The increase between those two years was about twice as great as all the increases which have taken place since, percentage-wise. If you do not go back earlier than 1949, you are simply leaving out a large part of the period in which the phenomenon you are concerned with took place.

Mr. SLOGAN: I still think the fact that 1949 came in right in the middle of the period 1947 to 1952 makes that comparison far more valid than if you were simply to try to compare 1960 or 1958 with 1947, because if you are going to do that you would have to hire a whole bunch of statisticians who would spend a lot of time trying to correlate all the figures you use.

Mr. COBURN: You do not gain information by throwing away part of the information you have.

Mr. SLOGAN: Could you please tell me when your price controls came off?

Mr. COBURN: In 1946, I think.

Mr. SLOGAN: That might be part of your answer—if prices went up the way they did in 1947.

Mr. COBURN: Certainly the fact that price controls went off is one of the reasons prices went up.

Mr. SLOGAN: That still would not give you a true picture over a long period of time, as to what went on. It would not give you a true comparison.

Mr. BURT: We are in the position that we wanted to know what happened the prices at a time when they went up more than in any other period of time.

Mr. SLOGAN: That is so if you are giving a true picture, but, obviously, you are not giving a true picture.

Mr. BURT: I think we are, and I do not think we should change or retract our position. We think it is proper to remember, in respect to the inventory, that the manufacturer has the inventory in his pocket. You can assume, or make a statement, that the inventory was not included in one of these figures, but you do not know whether it was or not.

Mr. SLOGAN: The fact is, that the main things we are interested in comparing are the profits in this industry as compared to wages; and even in the profits you have a whole bunch of unspecified profits included. In table 2, taking 1947 as base 100, you give non-specified costs and profits as 453.8 in 1952 and 190.7 in 1958.

Mr. COBURN: The main thing in which we are interested is a comparison of wages and profits. We do not have the profit figures, and we do not pretend we do. The other costs in our profits figures certainly do include other costs, and we have not tried to suggest to this committee that they do not. We are chiefly concerned with the relationship between wage costs and total costs. The change of the inventory figures will produce only a very minor change in that relationship.

Mr. SLOGAN: To take one figure in table 1, that figure of 9.5 in 1958 as "other costs and profits". Would you agree that between 1960 and 1949 the average profit on your index, compared to the sales value, was between 2 per and 4 per cent, on the average, in the farm implement industry?

Mr. COBURN: These figures do not give me any idea as to what the average profit was in the farm implement industry.

Mr. SLOGAN: I am giving you the figure. Would you agree?

Mr. COBURN: I cannot agree or disagree. I do not know what the figures are.

Mr. KORCHINSKI: Mr. Chairman, I am going on to a slightly different subject. On page 2, the first paragraph says:

It is not how much a worker gets per hour or per week that has a bearing on costs and prices, but rather how much he produces for what he gets.

I would very much like to agree with that, except that on page 11 the brief says that from 1952 to 1958 demand declined. On that page also, it says:

During 1952 to 1958, gross value of production declined 32.1 per cent.

Yet on the same page, in the second paragraph after that, you also say that the average hourly earnings rose 19.4 per cent. Can you explain why hourly earnings went up, production went down, and yet on page 2 you tell us it does not really matter, that it is really a production relationship.

Mr. BURT: Are you referring to the 19.4 per cent increase that we referred to in the last paragraph on page 11?

Mr. KORCHINSKI: Yes.

Mr. BURT: In relation to what we say in the first sentence of the second paragraph, that gross value of production declined. All our analysis here is on that kind of relationship. The reason the average hourly earnings rose is in relationship to the gross value of production.

Mr. KORCHINSKI: Yes, but when your production went down, why in the world must your wage have gone up? Could you indicate why you want to keep a relationship there? And why, when your production is going down, you require an increase during that period?

Mr. COBURN: Because of living costs.

Mr. BURT: Living costs are going up.

Mr. KORCHINSKI: On page 3 you give table 1, and I would like to quote some of your figures from it. For example, you state that wages in 1947 were 29.1. For the purpose of my argument here I am using your 24.4; whether it is accurate or not will have to be checked. You also state that salaries went up from 5.9 in 1947 to 9.4 in 1958. Actually, there is a separation between wages, because that is hourly wages, or weekly wages, as opposed to the salary. That all really means that somebody is working in this case right through. Someone is getting paid for some work done.

Mr. BURT: That is right.

Mr. KORCHINSKI: I think you will agree that in the materials figure the cost of labour also is included. Will you agree that in the 1939 inquiry the cost of labour in the cost of steel was estimated at 35 per cent, and so on. That was 1939 or 1937.

Mr. BURT: I do not know whether the percentage is right, but I remember the hearings.

Mr. KORCHINSKI: That was the relationship, I think, at that point, so if there was an increase—as you say you required an increase—someone else required an increase, and therefore in the end this all boomerangs and snowballs.

Mr. BURT: But there is a relationship between the manner in which it boomerangs. If you read the whole of our paragraph on page 11, it may become more clear. What has occurred—and this is what we have been trying to point out—is, as we say at the foot of page 11:

Value added output per manhour, however, increased 41.6 per cent. We are not making a case for an increase in wages, but we point out that where productivity increases—and I think it has become almost a national slogan in

some circles, that workers' productivity has not been increasing—it has been increasing far faster than wage increases. I think you will agree that if workers' productivity increases, they are entitled to have some consideration given to an increase in pay. According to our figures the productivity has increased far more than those increases in pay.

Mr. KORCHINSKI: You indicated that there was a decrease in the period. Why do you not take a decrease in wages? Let me go on—

Mr. BURT: You did not.

Mr. KORCHINSKI: Yes, I did. I am a farmer, sir. I did.

Mr. COBURN: May I point out that as shown in the table on page 3 there was an increase in the total wages paid. The total wages paid in 1952 were \$49,703,000 and in 1958 they were \$34,139,000. There was not a decrease in real wage rates, but there certainly was a decrease in the wage bill, which accompanied a decline in production.

Mr. KORCHINSKI: I shall deal with that shortly. There is one more thing in your submission. You indicate that labour, materials and transportation had been made factors in the cost of machinery. Now, if you look at the graph which I am getting prepared for me at the moment, you will find a relationship between wages and freight rates. As wages go up the cost of freight has been going up.

Mr. BURT: I do not think it is always in just that proportion. That goes for commodities other than transportation. It goes for agricultural implements, to which we point here. When we get a wage increase their price rises, but there does not seem to be any reason for the amount of the increase in price. The same thing applies to the steel industry, and I think Mr. Kidd could point out that wage increases have been used as an excuse for price increases, when many times that is not correct.

Mr. KORCHINSKI: Earlier you indicated that you were not concerned with what the profit was. You are trying to relate your increases to productivity, and you are not ordinarily concerned about what the manufacturers make.

Mr. COBURN: We are concerned about what they make but, as I think the brief makes clear, we fully recognize the figures available from the D.B.S. do not tell us what the profits were.

Mr. KORCHINSKI: Has automation greatly affected the output per worker?

Mr. BURT: Yes, we say it has. However, it depends on what you mean by automation.

Mr. KORCHINSKI: In the industry.

Mr. BURT: The government has set up a committee on technological changes, of which I am a member, and so far I do not think we have found a satisfactory definition for automation. The word "automation" was only coined in the last few years, but technological changes have been taking place, I guess, ever since Adam. It is reflected in the productivity per worker, with which we are dealing in this memorandum.

Mr. KORCHINSKI: Could it have been a contributing factor in the increased productivity?

Mr. BURT: It could. It would have an effect in two ways, in the decrease in the number of employees, as we point out here, and also it would have an effect on the increased productivity.

Mr. KORCHINSKI: So, in actual fact, the actual wage earners may not have contributed as much, except for the effect of automation?

Mr. BURT: In our industries we take care of that by what we call an improvement factor, which is used for determining the amount which we are entitled to on increased productivity. I may say, however, that I do not think it is sufficient.

Mr. KORCHINSKI: Therefore, if you found out there was higher production and you did not demand an immediate increase in wages, if you retained your wages at the level they were before production was increased, it might mean an increase in profits to the companies and, if the companies were convinced they should reduce their prices, that would mean a reduction in the cost of farm machinery to the farmers? If you looked at it first of all from the point of view of what is your responsibility, and then if the managements could be convinced of their responsibility, it could mean a reduction in prices?

Mr. BURT: I think we would be prepared to do that, but we have never found a management of any size prepared to reduce its prices in the last 15 years.

Mr. COBURN: As a matter of fact, our union in bargaining with the automobile industry has offered several times that if the companies would reduce the price of their cars by \$100 a unit we would accept whatever kind of wage pattern was feasible, within the consequent price reduction. The companies, however, have always refused to take us up on that.

Mr. KORCHINSKI: Then could you indicate why, since the C.N.R. is working at a loss, you still have to get an increase?

Mr. BURT: You would need to have Frank Hall here to answer that.

The CHAIRMAN: I think that line of questioning is straying from our orders of reference.

Mr. HORNER (*Acadia*): My other question deals with page one of the brief. You suggest, and I shall read from the middle of the page:

The index of farm implement prices to the farmer has just about doubled; from 126.3 to 254.2.

I am not going to quarrel with that, except to say it has a little more than doubled. You say it doubled, meaning it has increased 100 per cent; but actually it is 102 per cent. You then go on to say:

Most of the increase in farm machinery prices took place between 1947 and 1952. The farm machinery (retail) price index increased 54.7 per cent in the five years from 1947 to 1952. This is over twice as much as the 27.1 per cent increase in the seven years from 1952 to 1959.

My question on that part would be: In drawing a comparison, as you have here on percentages, do you not believe it would be better if those percentages were worked out on the same basis?

Mr. COBURN: I think not. What we are trying to show is the percentage from 1947 to 1952, and the percentage from 1952 to 1959. Now, you can work the figures out in another way, and you will get somewhat different figures which will mean something else. What we were trying to tell the committee is that the percentage doubled from 1947 to 1952, as compared with the increase from 1952 to 1959. This is a perfectly valid way of presenting the figures. The fact that someone else could think of some other way of presenting the figures does not make this less valid. If we had done it another way, some other members of the committee might have said: "Do you not think it would be better to show the percentages from 1947 to 1952 and from 1952 to 1959?"

Mr. HORNER (*Acadia*): Here you have drawn a comparison between the two periods, the increase between 1947 and 1952, and you say that is twice as

much as the increase between 1952 and 1959. Let us say, for example, the index was 40 at one particular period and it increased 20 points. That would be a 50 per cent increase. Do you agree?

Mr. COBURN: Yes.

Mr. HORNER (*Acadia*): Then you could have the index going up to 60 points, and say in the next given period it increased by the same amount, another 20 points. Do you understand what I mean? Then you would have an increase of 33 per cent. There you have two periods, and you are comparing two identical alike increases and two different percentages.

Mr. COBURN: But they are not two identical alike increases.

Mr. HORNER (*Acadia*): But you are concerned with two given periods, using a different basis for both comparisons. You have figured out the first increase as so much, and you have figured out the second increase per 100 on a new basis, on the 1952 basis.

Dr. FORSEY: It is twice as fast a rise.

Mr. MONTGOMERY: It is also different machinery. It is a different type of machinery.

Mr. HORNER (*Acadia*): I have pointed out that you have an identical alike increase of 20 points—

Dr. FORSEY: Points, but not percentages. The point is that an identical point increase in one case shows a much faster rise in the other, taking your base as 100 in each case.

Mr. HORNER (*Acadia*): I do not object to that at all. You can take any base here you like and go from there, but I say in comparing two years one should use the same base so that the results are true comparisons.

Dr. FORSEY: But you are not comparing two years. You are comparing rises over two different periods, and if you compare the rate of increase over two periods you simply cannot use the same base at all. It is arithmetically impossible.

Mr. HORNER (*Acadia*): Using your interpretation, supposing the increase shows the index goes to 400 or 500, then a rise on that would be a relatively small increase?

Dr. FORSEY: Yes.

Mr. HORNER (*Acadia*): In comparison?

Dr. FORSEY: Yes, certainly.

Mr. HORNER (*Acadia*): Then the higher the figures get, the slower the percentage of rise will go?

Dr. FORSEY: For a given number of points, it should.

Mr. HORNER (*Acadia*): So that, let us assume the increase will be up quite high in 1970, then your rise will be relatively slower?

Dr. FORSEY: Over the period from 1958 to 1970, certainly. This is an arithmetical truism.

Mr. HORNER (*Acadia*): I would not object to using the comparison in that way, but I would point out to the committee that that is not the way it is done in this particular instance. It has always been my interpretation that percentage means part of 100. In this particular case you have had an increase from 1947 to 1958 or something like 95 per cent or 96 per cent?

Dr. FORSEY: Yes.

Mr. HORNER (*Acadia*): And in the first five years of that period the increase was 54.7 per cent, and in the next seven years the increase was more like 41 per cent or 42 per cent?

Dr. FORSEY: Of what?

Mr. HORNER (*Acadia*): Of taking the year 1947 as a base.

Dr. FORSEY: Certainly.

Mr. HORNER (*Acadia*): We farmers realize there has been a drastic increase in prices, and that increase actually rose to 102 per cent from 1947 to 1960, but you have decided to use the year 1959, when it had increased roughly 95 per cent. That is not the exact figure, because I have not got my figures before me. However, it was something like 95 per cent from 1947 to 1959. Now, we all realize in working out percentages we must arrive at a maximum of 100. We all realize it must be 100, and all I am saying is that in this case the 100 per cent is 95 per cent, and that if the increase had been 54 per cent in the first five years it must have increased by the balance in the next seven years.

Dr. FORSEY: Certainly. The rate of increase in the last seven years was much higher than the rate of increase in the previous five years.

Mr. HORNER (*Acadia*): You mean much slower?

Dr. FORSEY: Much slower.

Mr. HORNER (*Acadia*): I would agree, because it took seven years to increase 42 per cent, and only five years to increase 54 per cent. I am not arguing with that. All I am saying is that it has not been twice as much.

Dr. FORSEY: It has, in terms of the increase. It is the rate of increase which this whole paragraph is about.

Mr. HORNER (*Acadia*): I do not see the word "rate" mentioned at all in this paragraph.

Mr. NASSERDEN: In page six, table three, you give wages as 157.6 per cent and salaries as 301.0 per cent.

Mr. BURT: What page is that?

Mr. NASSERDEN: Page six, table three, column B; and somewhere you made a statement that the cost of labour did not affect them, and was not too important so far as the final price of machinery was concerned.

Mr. BURT: We did not say that. Comparatively speaking, it represents a smaller proportion than we think is generally supposed to be the case.

Mr. NASSERDEN: According to these figures it would represent something over 40 per cent, in wages and salaries alone. Then there are also materials, in which there would be labour costs.

Mr. COBURN: You are adding wages and salaries together, but we are following the D.B.S. practice in keeping them separate.

Mr. NASSERDEN: So far as we are concerned, there is no difference between wages and salaries. They are paid to people working in the industry.

Mr. BURT: You would think there was a difference if you were working on the hourly rate.

Mr. NASSERDEN: That is a problem for you and the companies to haggle about. So far as the farmers are concerned, these are costs which he has to pay, and they go to the employees of the companies.

Mr. COBURN: From the point of view of a trade union there is a great difference between the wages which we negotiate, and the salaries, about which we have no say whatsoever.

Mr. NASSERDEN: I am not going to argue about that. They still constitute roughly between 40 per cent and 45 per cent of the cost of the unit. Then there is the cost of the labour that should be included in the materials, and so on. So I think it fair to say that the price of labour in the production of farm machinery is a very important factor in the final price.

Mr. BURT: There is no doubt about it. We are not quarrelling about that; we are pointing out how salaries went up comparatively. I think probably one

of the reasons for that is the change in distribution between the hourly rated people and the white-collar or salaried workers. There is a change taking place throughout industry in both Canada and the United States. There is an ever increasing number of salaried workers and a diminishing number of blue-collar workers. We just show the distribution here. We have never said any place that wages do not account for a substantial amount of costs. Of course they do; they could not help but do that, but the proportion is much smaller than is supposed. According to public statements we have read, we are entirely responsible for the increases in prices that are going on right now, particularly that the trade union movement is solely responsible for inflation in Canada. That is just a lot of nonsense.

The CHAIRMAN: Mr. Nasserden, this would be an opportune time to adjourn. We will meet again this afternoon at 2.30.

AFTERNOON SITTING

MONDAY, May 29, 1961.

The CHAIRMAN: I believe we have a quorum this afternoon, gentlemen.

Mr. Slogan, I think you have a question.

Mr. SLOGAN: Earlier I think the witness mentioned the fact that there has been an increase in the cost of living during the period under consideration. Would you give me an idea as to how the average hourly earnings have increased in comparison with the cost of living increase?

Mr. BURT: In what period?

Mr. SLOGAN: You could take the period 1949 to 1960.

Mr. COBURN: We do not have those figures here. Certainly wages have gone up faster than the cost of living because workers in this industry, like in other industries, have gained from the productivity of the unions.

Mr. SLOGAN: On page 343 of our minutes of proceedings and evidence there is a graph showing that since 1946 the cost of living price index rose sixty-five per cent and in a similar period the average hourly earnings have risen 149 per cent. It would perhaps help us if you could give us a comparison of the wages in the implement industry compared to wages in other industries.

Mr. COBURN: I think the only figure is with regard to the rate of increases in wages between 1952 and 1958 compared to other industries.

Mr. BURT: Durable goods and non-durables.

Mr. SLOGAN: But are the present wages in the agricultural implement industry not quite a bit higher than in the durable goods industry?

Dr. FORSEY: But it is part of the durable goods industry?

Mr. SLOGAN: I have some figures here which are based on D.B.S. figures for December, 1960, showing the average earnings in the agriculture industry were 2.13, in the durable goods 1.97, transportation and equipment 2.08, iron and steel production 2.09; and all manufacturing lumped together 1.82. The other thing which I wanted to mention here is that the factors of primary concern to the farmer in the makeup of his costs are iron and steel, in respect of the implements, in which the hourly earnings are 2.09, and transportation, in which the hourly earnings are 2.08. Then in the agricultural implements themselves the average hourly earnings are highest of any at 2.13 as compared to 1.97 in the durable goods industry.

Mr. COBURN: Those comparisons are very tricky, because unless you investigate the whole field you do not know how much of that differential is due to higher production or more highly skilled workers in one industry, or how

much of it is due to higher wage rates for the same job. Our experience has been that in similar industries wage rates for the same kind of work do not tend to be very much different one from the other. However, you certainly will find differences in the mix of workers in one industry as against another, which may produce a difference in the overall average earnings. The other problem which arises when you take figures for just one month is that these are gross hourly earnings which include overtime, and unless you look at the number of hours worked in the industry you do not know whether or not the figures for one industry may contain more overtime than those for another.

Mr. SLOGAN: I believe these are the latest figures available. Would you agree that the wages paid in the agricultural implement industry are as high as or higher than in any other industry.

Mr. COBURN: I do not think so; not when you take wages for the same kind of workers. You may be able to make comparisons on the basis of the average earnings of workers, but that is not the same thing.

I have found the figures mentioned in our brief. Between 1947 and 1958 the average earnings of workers in the farm machinery industry increased by 103.2 per cent, in the durable goods industry by 104.5 per cent and in non-durables by 106.8 per cent. I would suggest that it is the hourly increase which is more significant than the level of earnings. There may be all kinds of factors, particularly the mix of skills.

Mr. SLOGAN: The same figures would apply here. If the agriculture industry enjoyed such a wonderful year in 1947, perhaps the wages had increased substantially at that time. When you compare them with durable goods over the next 15-year period, you are going to get a distortion.

Mr. BURT: There is something else in the agricultural implement industry, and that is the matter of incentives. Some of the durable goods industries have no incentives, but the agricultural implement industry does have incentives, which tend to increase production rates. Generally you find that the labour rates in two such industries do not compare well. You may have quite a difference, even in that respect, which may tend to make it look as though wages in the agricultural implement industry are higher. The point we are trying to make in this brief is that wages are in direct ratio to the amount produced. The wage rate per hour is not so important. It is when you apply wage rates to the total amount produced that you get the proper analysis.

Mr. SLOGAN: My final question has to do with tariffs. In the farm implement industry we find a relatively free market across the border. Do you agree that has not hindered the implement industry in Canada to any extent?

Mr. BURT: I think it has been an advantage to have the situation as it is now because, according to the figures available to us, the American market, which I presume is what your are talking about, has been developed by the industry. We have been successful in competing against the big companies in the United States in certain fields. However, in the tractor industry we have not been so successful, with the result that one particular company in Canada, which only produces tractors, is taking quite a licking right now in respect to imports from the United States, chiefly because of the volume coming in. Otherwise, we have developed quite a good business with the United States, and this, I might add, also gives the farmers in Canada an opportunity to buy as cheaply as the farmers in the United States, which is not true in the automobile industry. If you buy a car in Detroit you will find there is quite a big difference in what it would have cost you had you bought it in Windsor, just across the border.

Mr. SLOGAN: Do you claim it is desirable to have a situation such as exists in the farm implement industry, in other industries; such as the automobile industry?

Mr. BURT: I do not think it applies across the board. These plants have been built up over many years with the aid of tariff protection, and because of the tremendous dislocation it would cause in employment, along with other considerations, one could not give a straight answer and say all tariffs should be wiped out. Careful consideration would have to be given to it. After all, if an industry is good for Canada, maybe it should be protected in some measure. Maybe we have industries which are not so good for Canada and we could do better in some other way, but so far as a stock answer in this field is concerned you might not be able to apply the same yardstick to the agricultural implement industry which has built up an American business with no tariff.

Mr. SLOGAN: This is my final question. Do you agree with the statement that, relatively speaking, the worker in, say, the agricultural implement industry, as compared with the farmer over the same period of time, has been able on an hourly basis to purchase more food than he could previously, whereas the farmer, on the basis of what he sells, has been able to purchase less?

Mr. BURT: I have no figures to prove that. I do not know what the farmers are able to purchase. We do know that their income has been steadily declining and we ourselves are very concerned about that, because it can affect employment in the agricultural implement industry also. Anything which affects detrimentally the agricultural implement industry, which is one of Canada's greatest, is of concern to us. An examination of the whole picture, and probably a little more planning on the part of the Canadian government, might result in some relief.

Mr. KORCHINSKI: I would like to ask—

The CHAIRMAN: I am sorry, Mr. Fane is next.

Mr. FANE: I have a couple of questions which I wished to ask before we recessed for lunch. I should like to ask the witness, why does the brief include special or separate items for salaries and wages? They all enter into the price of the thing which is being produced, and I should like to know how you can separate them. The people who are working for wages cannot get on without the people who are working for salaries.

Mr. BURT: We wish we were all on salary.

Mr. FANE: That is no answer.

Mr. BURT: We do not believe that the worker who is paid by the hour should be paid by the hour, while the guy in the front office is paid by the year. We would all like to be paid by the year and put on the same basis, but that is not possible. The reason we have separated these items is because we negotiate for the wages and in most cases we do not negotiate for people who are on salary, particularly for those on salary in supervisory or executive positions. We would have nothing to do with their wages, and so there is no bargaining going on between the two. Another reason for separating the items is that these figures have been separated by the D.B.S.

Mr. FANE: In other words, you do not count them in since you do not negotiate for them?

Mr. BRUNT: We count them in, but here they are separated.

Mr. FANE: If you talked for them you would count them together?

Mr. BURT: No, we would still separate them.

Mr. FANE: I cannot see the sense of that. They both form part of the cost.

Mr. BURT: We would agree with that, and maybe we will be able to convince the manufacturing companies that our people should be paid by the year, like the executives in the front office. When that is done we will put them all together.

Mr. FANE: In your brief you remarked that material is the greatest part of the cost other than, of course as you would say, the profits. However, you do not give a figure for the cost of wages which go into the manufacture of the material that is used. Labour costs are involved in material before it is ready to be put into a machine. There are several types of wages added to the cost of the material.

Mr. BURT: Yes, but those figures are not available to us. I doubt if anyone, no matter what his training might be, could come up with an answer to that, considering that the material comes from so many sources, and involves thousands and thousands of parts from I do not know where. However, those costs are included in the figures we have submitted for material.

Mr. FANE: You have just counted the cost of the material, and not the part of it cost which is taken up by labour?

Mr. BURT: It is quite impossible to get that figure. We should very much like to have it. On the other hand, we have not included that part of the cost of material which is taken up by profits.

Mr. MUIR (*Lisgar*): Evidence has been presented to the committee to show there has been some integration of farm machinery manufacturing on a continental basis, and I should like to ask the witness does he consider it a desirable development from the farmers' standpoint?

Mr. BURT: Yes, we do. We believe it would be far better if we could buy into the American market in other industries. It would be far better for Canada, and here I think we are speaking about the American market generally. But it would also be good for Canada in other foreign markets if we could produce some of the things we make here in greater volume. That would reduce their price, and I think a good example of that is what has been happening in the agricultural implement industry. I would imagine that if we only supplied the Canadian market with farm implements from our Canadian companies, and had a tariff wall against the importation of American farm implements, generally speaking the agricultural implement industry would go off.

Mr. MUIR (*Lisgar*): The Canadian farm machinery companies compete on an open market tariff-free basis with American companies, but the American companies have a considerable freight advantage, particularly at the moment in the large areas of the middle west. Do you feel Canadian companies might have other advantages that would enable them to be even more competitive?

Mr. BURT: They have a wages advantage.

Mr. MUIR (*Lisgar*): That leads me into my next question. According to the evidence submitted to the royal commission on Canada's economic prospects, by Fullerton and Hampson, wages in Canadian secondary manufacturing industries are some 25 per cent below similar wages in America, and output per man is something like 35 per cent to 45 per cent below that in the United States. These conclusions are reached in the royal commission report of 1957, page 239, which I am going to quote:

If scale is the main problem for our manufacturers in competing with imports from the United States, the level of Canadian wages to some extent neutralizes the disadvantage. It has been estimated that wages in Canadian secondary industry are some 25 per cent below those in the United States, reflecting a roughly equivalent difference in the per capita productivity of the two economies. The fact that the difference in productivity in secondary industry is greater than the gap in wages is an advantage, however means that in this sector union labour costs tend to be higher in Canada than in the United States.

Would this suggest to you, sir, that unless Canadian efficiency goes up, labour costs are indeed a very important factor in Canadian manufacturing?

Mr. BURT: Are you dealing with all secondary industry, rather than with agricultural implement industry?

Mr. MUIR (*Lisgar*): I am dealing with secondary industry, but I think this would apply to you.

Dr. FORSEY: Oh, no.

Mr. BURT: It would not necessarily apply.

Mr. MUIR (*Lisgar*): Why not?

Mr. BURT: Because you have related it to the wage differential in the agricultural implement industry in Canada and the United States. I thought this was another question following on your first question in regard to integration. Some of these industries are not integrated and, as a matter of fact, in the automobile industry the wage spread is much greater between Canada and the United States.

Mr. MUIR (*Lisgar*): These gentlemen, dealing with Canadian secondary manufacturing industries, place our productivity in the Canadian machine manufacturing industry as 25 per cent below that of the Americans.

Dr. FORSEY: In agricultural implements?

Mr. MUIR (*Lisgar*): In agricultural implements, yes, sir.

Mr. BURT: One of the things which is hard to do is to make a comparison, even between Canadian subsidiary plants, such as International Harvester, and subsidiaries which, in the case of Massey-Ferguson, are in the United States. In attempting to make wage comparisons you have to narrow them right down to classifications, and it is awfully hard to get averages, because you have to compare plants exactly. One of the most important things is probably volume, and in the United States they have a tremendous advantage in volume over Canadian plants. I do not think anybody around this table is suggesting that Canadian workers, as a group, are lazy or any less efficient or any less inclined to work than Americans are.

I happen to live in a border city and at times we have made some comparisons in the automobile industry. Sometimes it is true one way in a group of people, and sometimes it is true another way in another group. It is almost impossible to answer the question on the basis on which it is put here. I know that when we are bargaining with manufacturers they will not accept that kind of comparison from us.

Mr. MUIR (*Lisgar*): You will note, sir, I do not allege the Canadian worker is that much less efficient than his American counterpart, but the fact remains that Canadian production—and I do not know how much the worker enters into this—in secondary industry is roughly 35 per cent below that of the American production. I am not alleging that has anything to do with Canadian workers whatsoever. It may be in the tools they have to use.

Mr. HORNER (*Acadia*): Automation.

Mr. MUIR (*Lisgar*): That is something the committee should consider.

Dr. FORSEY: May I make one comment? I do not think you can regard the Canadian implement manufacturing industry as a typical secondary Canadian industry. I think it is a special case, because it has free access to the American market, which most Canadian secondary industries have not got, and therefore it enjoys the advantage of large scale production because it has a continental market. I have not looked at these figures of the royal commission, the Gordon commission, recently. I cannot recall what they are, and I cannot recall the actual productivity figures for the agricultural imple-

ment industry being in it, in any case. Perhaps they are, but I do not remember them. The other point to remember is that these figures are outdated and, so far as I know, they have not been kept up to date. As I recall it, the last figures filed in that report were for 1955 and, of course, quite substantial changes have been made since then.

Mr. MUIR (*Lisgar*): I have one last question. I think it is on page 3 of your brief you allege that one of the reasons for the high cost of farm machinery is because of the distributors' price spreads, and yet evidence given to this committee by the Canadian federation of implement dealers was to the effect that their mark-up on farm implements has remained at 25 per cent on the marketing price over the years, and that the mark-up on parts has remained at 27 per cent throughout the same period. In other words, the dealers tell us they have not increased their mark-up, as you allege in your statement.

Mr. BURT: We suggest to you there is evidence to show they have, and the evidence, as we see it, is shown later on on page 14 of the brief, table 6.

Mr. MUIR (*Lisgar*): What page is that?

The CHAIRMAN: Page 14, table 6.

Mr. COBURN: All the D.B.S. figures show is simply that during the relatively short period from 1956 to 1959 manufacturers' selling prices went up 10.1 per cent, the import prices, at the border, of the implements that came in, went up 10.0 per cent, and the D.B.S. index of related prices paid by farmers went up 18.6 per cent. This certainly suggests there has been an increase in the dealers' mark-up. We do not know what the cause of that increase has been, but our brief suggests it is something which this committee might well inquire into. I think these figures pretty well speak for themselves.

Mr. MUIR (*Lisgar*): Of course you realize that since that time there has been quite a substantial increase in transportation costs and distribution costs?

Mr. BURT: I do not think they would make that much difference.

Mr. MUIR (*Lisgar*): I did not say that much.

Dr. FORSEY: I would not think so.

Mr. COBURN: I did not say so.

Mr. MUIR (*Lisgar*): We are more or less inclined to have to take the word of the implement dealers until they are proven wrong.

Mr. COBURN: I suggest, sir, these figures prove them wrong.

Mr. MUIR (*Lisgar*): These figures are D.B.S. figures, not your figures, so if somebody is proving the farm implement figures are wrong, it is really the dominion bureau of statistics figures which are wrong.

Mr. HORNER (*Acadia*): Supplementary to that particular point, I do not think Mr. Argue means to mislead the implement dealers. I think he has supported before this committee the implement dealers along with the rest of us, but the point that is meant here is that the distribution costs have risen. That may not be the dealer's distribution costs. The company's costs may have risen, but it may not be in the 20 per cent dealer's mark-up.

Mr. BURT: We qualify that on page 15.

Mr. COBURN: We do not know where the actual increase takes place, but there certainly appears to have been a sharp increase somewhere in the cost of distributing farm implements.

Mr. HORNER (*Acadia*): That is not necessarily in the dealer's profit.

Mr. COBURN: That is right; you have to differentiate between mark-up and profit.

Mr. HORNER (*Acadia*): We had evidence before that mark-up has not gone up, but the company's share of distribution may have gone up. That accounts for your figures on page 14.

Mr. COBURN: Undoubtedly distribution costs have gone up very sharply.

Mr. HORNER (*Acadia*): My next question deals with your statement on page 5 of the brief. You say:

However, as the analysis will show, price increases were far in excess of those which could be justified by the relatively small increase in wage costs.

I wonder what you mean by "relatively small increase in wage costs"? That is between the years 1947 and 1952 where the biggest increase in machinery prices occurred.

Mr. COBURN: Taking into consideration the fact that wages themselves represent only between 25 and 30 per cent of the total cost, and, secondly, that a substantial part of the increase in wages is counterbalanced by the increase in productivity, our figures show that for 1947 to 1952 wage costs per output have only gone up 28.6 per cent, while the total cost went up 54.7 per cent.

Mr. HORNER (*Acadia*): I would like to point out to you, sir, that in considering wage costs you say: "relatively small increase", you do not say "other costs", you say they are justified by a relatively small increase in wages.

Mr. COBURN: Relatively, because it does relate to other costs.

Dr. FORSEY: And to the total.

Mr. HORNER (*Acadia*): I looked up some figures in the *Agricultural Implements Industry* publication by D.B.S. and in the review of man hours and hourly earnings from 1946 to 1959, in 1946 the hourly earning was 81 cents an hour, in 1952 it was \$1.60. This appears to be awfully near an increase of 100 per cent. I would say that this would be quite an increase in cost.

Dr. FORSEY: That is not cost, that is hourly earnings. This regards the amount of production you get out of it.

Mr. HORNER (*Acadia*): You take a look at the agricultural industry report. I have figured out that in 1947 the average wages earned per year by a worker in the agricultural implement industry—using the figures that you have in table 1 of your brief—the average wages of a man was \$1,869, and in 1952 the average wages a man earned was \$3,369. This figures out to an increase of 80.25 per cent. Would you still maintain that this is relatively small?

Dr. FORSEY: It is not cost. Look at table 2 on page 4, item 4—costs per unit of output. The wage cost per unit of output in 1952 was 128.6 per cent above what it was in 1947, and total cost per unit of output was 154.7 per cent above what it was in 1947.

Mr. HORNER (*Acadia*): I realize what you are getting at, sir, but I would like to ask you this question before I deal with the cost angle you are presenting. You will agree that wages increased substantially in this period?

Dr. FORSEY: No one ever said the contrary. Earlier you made an observation with respect to wages. From where did you quote first?

Mr. HORNER (*Acadia*): The middle of page 5.

Dr. FORSEY: Wage costs.

Mr. HORNER (*Acadia*): I realize what you mean now by "wage costs". I agree, but I would like to ask you a question. But first to clear up this thought that is in my mind, I wonder if you will agree that hourly earnings have practically doubled, and wages have gone up 80 per cent, as I have quoted in these figures?

Mr. COBURN: Even salaries in the House of Commons have gone up substantially—everyone is concerned.

Mr. KORCHINSKI: Not the farmer's cost.

Mr. ARGUE: The output has gone up too.

Mr. COBURN: Might I say at this point that we have presented briefs to previous governments urging action to do something about income, because we are concerned about this also.

Mr. HORNER (*Acadia*): I am not through with this. I agree with you, sir, and I am not trying to disagree with you at all; I am trying to get this statement clear in my own mind, and you have cleared it up to quite an extent. I realize now—and you can correct me if I am wrong—that machinery has increased 54.7 per cent from 1947 to 1952. Hourly earnings have increased roughly—the average wages paid in the implement industry have increased about 80 per cent in the same period. Am I right in this?

Mr. COBURN: 1947 to 1958, not 1952.

Mr. BELLINGHAM: It is not salaries, also.

Mr. BURT: You are quoting 1947 to 1952?

Mr. HORNER (*Acadia*): 1947 to 1952. All I did was divide this. You have on page 3 total wages paid, and I have taken the number of workers and divided them. I got \$1,869. In the wages paid in 1952, I have taken the number of workers and got this figure out as an increase of 80 per cent. I am wondering if you agree that prices have increased 54 per cent while wages have increased 80 per cent?

I will now proceed to another question with regard to wage costs.

Mr. COBURN: Those two facts are not relevant.

Mr. HORNER (*Acadia*): But you agree with them?

Dr. FORSEY: We have not done the arithmetic in this.

Mr. HORNER (*Acadia*): Would you agree that wage costs—and here you are talking about wage costs per output—would you agree that wage costs per output would vary to some extent with the number of salaried persons? We have had before us companies saying that, for example, the more people are put on salaries in engineering and research, automatically greater efficiency and automation would result in the production workers part of the industry, so that increased expenditure in the salary division might increase output per wage unit in the production division. Is this a relative thing to assume?

Mr. COBURN: That is possible; it is not always the case.

Dr. FORSEY: Most of the workers are people who bring ideas to the boss.

Mr. BURT: We will go this far to say that sometimes an increase in the time study and engineering department makes the man work faster in the back shop.

Mr. HORNER (*Acadia*): Of that you have more knowledge than I.

Mr. BURT: You would agree that it would?

Mr. HORNER (*Acadia*): It might; you have more knowledge of this.

Mr. BURT: We have a great deal of knowledge on that.

Mr. HORNER (*Acadia*): I am looking at it from the farmer's point of view because I am a farmer. If machine companies spent more money in trying to devise simpler machinery, such as they have with regard to the difference between a tiller and a discer, this is a good example, the difference between heavy cast iron pieces that used to be on the older type of machinery and now with malleable iron welded together and so on, the more innovations that are brought in under this line—and I expect machine companies tell us they are

brought in through expenses in research and engineering—I would suggest that to use this might to some extent improve productivity per hour. You would agree with that?

Mr. BURT: That is right.

Mr. HORNER (*Acadia*): I have one further question on productivity per hour. You agree that with regard to productivity per hour one would have to consider the amount of capital used. In other words, productivity per hour of a group of labourers making an implement with poor tools or with outdated tools might be pretty poor? But if a company came in and spent a lot of money in improving their machinery in the shop and improving their tools then their productivity might go up also. Do you agree?

Mr. COBURN: I would add to that that the general experience has been that with more technology and advanced equipment actually the capital required per dollar of production has tended to decline. The productivity of capital has been increasing as well, because what happens is that you may get rid of 20 old machines and replace them with one which costs perhaps 50 per cent more than the original 20 but produces 100 per cent more. This has been common experience in industry. The companies, when they automate, invest more capital.

Mr. HORNER (*Acadia*): This may be your knowledge of industry, which is better than mine, but I am just suggesting that in figuring out wage costs per hour there are other things that have to be taken into consideration such as capital investment. The other suggestion I made here—mentioned it a while ago and you agreed with it—is that these two have to be taken into consideration when you are figuring out wage costs per unit of output.

Mr. COBURN: I do not think they affect the validity of our major contention, which is that any increase in prices resulting from increased wage costs represents only a very small fraction of the total increase in prices.

Mr. HORNER (*Acadia*): Would you give us some idea then of the following. I have suggested to you that prices have risen 54 per cent—this comes from your own brief—and that wages earned by workers have increased 80 per cent, and you did not deny that. Would you also say, or could you give us some idea as to the cost of iron in these various years? I am not speaking of material, I am speaking of iron.

Mr. COBURN: I do not have the figures.

Mr. HORNER (*Acadia*): I carried in enough books and I did not bring any more. I was looking in the library during the noon hour and looking at the index I saw that pig iron and material generally increased more from 1947 to 1952 than it did from 1952 to 1958. Would you have any knowledge of this?

Mr. COBURN: I do not have any knowledge of it but I would think that it is probably true in terms of general prices.

Mr. KIDD: It is quite true. The increases in primary iron and steel since 1957 have been relatively small increases. The last time I looked the increases in rolling mill products only amounted to 3 per cent since 1957. So the bulk of increases came prior to that year.

Mr. HORNER (*Acadia*): I am just putting this in the right light. I do not want to be accused of sticking up for machine companies, because some of them thought I was rough on them. I have quoted you figures on the wage earnings prior to 1952, and you have agreed with my assumption that the increase in material such as pig iron, wrought iron and malleable iron, as you suggested yourself, was greater before 1952 than afterwards.

Mr. KIDD: I could not speak on that. All I said was that the increases had come prior to 1957.

Mr. HORNER (*Acadia*): In looking at indexes in the library, this was the impression I got from them. It would tend to point to the fact that if these basic costs in the machine industry—and I used wrought iron particularly because I wanted to find out what the basic material cost is—if wages went up a substantial amount they must have gone up in iron foundries and other industries, so that material would naturally have risen sharply from 1947 to 1952 more than it did after 1952. Would you agree with this? It would tend to point to the fact that companies might be justified in having a greater increase before 1952.

Mr. KIDD: On that point we have often suggested that there should be a national investigation of primary iron and steel in this country. The first time we asked parliament to investigate steel prices was in 1949. We asked for it prior to 1949. In 1947, in keeping with what my friends the automobile workers said, our union had said we would forgo price increases. That was in 1947, which happens to fit in with a lot of the discussion we are having here. This was refused by industry, to use their words "because it was none of our business". This was primarily in steel. We subsequently asked the parliament of Canada to investigate steel prices; nothing happened. In 1958 we made the same proposition to the iron and steel industry, that they forgo price increases and we would reconsider our wage requests. Nothing happened. We then proceeded to parliament; we wrote to the Prime Minister and asked for hearings on the question of prices. We had a meeting with the cabinet, but nothing ensued from that time until now. We are of the opinion it is unlikely that an investigation of primary steel prices will be carried on in this country for some time to come.

You say that steel wages have increased—certainly they have. I would think offhand that from 1946 until now we probably tripled wages in basic steel. But at the same time we were tripling our wages, our production went up to the point that labour's share of the sales dollar declined from 33 cents to 24 cents on the dollar. I would very much like to see an investigation into steel prices. If you want to find out what caused the rise in the price of iron and steel in the agricultural implement industry, it would be very good. This would get us right back to the basic facts.

Mr. FORBES: What year did you make your request to the government?

Mr. KIDD: We made it prior to 1949. There was a House of Commons committee in 1949 and we asked at that time for a hearing. The last time was in June of 1958—this present government was asked.

Mr. BURT: You have been asking pretty well every year.

Mr. KIDD: This has been a continuing process with the steel unions. We constantly ask them to reconsider.

Mr. ARGUE: This is a standing offer?

Mr. KIDD: I will not say that this offer is valid this afternoon because negotiations are about to open.

Mr. ARGUE: You have requested the federal government for an investigation into the steel industry and it stands as of this afternoon. You, as a representative of the steel workers, welcome this?

Mr. HORNER (*Acadia*): Just one more question on the volume of production. On table 2, page 4 you have besides volume of production, No. (3) "gross value of production deflated by farm machinery (retail) price index". I wonder if you could explain that.

Mr. COBURN: I thought we explained that in the text of the brief, that this was the only figure we had. There are no D.B.S. index figures for that whole period of manufacturing selling prices. They produced their index only very recently for the years 1956 to 1959. We took the retail price index because

it was the only one available, and, as we pointed out in the text of the brief, part of that increase in retail prices has actually been an increase in distribution costs rather than in manufacturing cost. Then all of these figures of cost increase are somewhat lower than the D.B.S. figures would suggest. But we had no choice; we had to take what information was available.

Mr. HORNER (*Acadia*): But do you think this figure would be accurate because of the gross value of production at the factory? I would think that this would be wholesale valuation.

Mr. COBURN: That is right. That is the figure we would very much like to have, yes.

Dr. FORSEY: We can get it for various years, 1956 to 1959, but before that they have not got it.

Mr. HORNER (*Acadia*): So it is difficult to figure that on a retail basis, because you have 20 per cent mark-up, at least.

Mr. COBURN: If the mark-up has not changed, that does not make any difference, because the wholesale price will bear the same relation to the retail price. It is only if the mark-up has changed that this becomes a problem. In this respect, we would hope that your farm implement dealers are correct, because it would simplify our problem.

Mr. HORNER (*Acadia*): I have a good reason to believe that they are. At least, I have not had any reason to believe that they are not. However, I am not going to bother with that particular question any further. I wonder if you could give us some idea of what you consider is in the item "other costs, other than profit"? What do you consider is in that?

Mr. COBURN: As a matter of fact, I think the people with publications on the farm implement industry give a list of some of them. It would include such things as advertising, some administrative costs which are not covered by wages or salaries. It probably includes—

Mr. HORNER (*Acadia*): It would cover capital investment in the industry?

Mr. COBURN: Not capital investment. It would probably cover interest on investment.

Mr. HORNER (*Acadia*): Would it cover retooling?

Mr. COBURN: It might. That would really depend on how the company produce their figures, I should think.

Mr. HORNER (*Acadia*): Would not retooling be a capital investment, to some extent?

Mr. COBURN: I would not know that without being able to look at the company balance sheet. Some of them are inclined to put it in as capital investment, while some others put it in as current expenditure. It would probably include depreciation, however.

Mr. HORNER (*Acadia*): I would like to point out that capital and retail expenditures in the agricultural implement industry vary from one year to the next. In the D.B.S. return for 1952 the total investment was \$12 million in Canadian industry. In fact, in the years 1948 to 1952 the capital investment averaged in the neighbourhood of \$10 million.

Mr. COBURN: Capital investment certainly would not include any unspecified costs.

Mr. HORNER (*Acadia*): I am reading out of this table, for the first listed, construction machinery and equipment—then they give a sub-total—then they add repairs and maintenance expenses, construction and repairs, and machinery equipment. I would think that this would be another cost.

Dr. FORSEY: No, because this capital expenditure would be charged to capital account. Surely, by proper accounting practice, one ought not to charge to cost in the year in which they were made. If that were done it would mean fantastic changes in the cost from year to year. I think that is precisely shown in the case which you cite, because the capital would then vary extraordinarily from year to year. Depreciation would be an annual charge.

Mr. ARGUE: There is one question which I should like to ask in regard to page 2. You make a reference there to "administered prices". I am wondering if I could get some comment on what you really mean by this, and to what extent you may feel there is any genuine price competition in the farm implement industry—in the case of price leadership, or just what the position is in Canada in the farm implement business.

Mr. COBURN: Administered prices generally are prices which are determined in an industry where the number of firms which really determine the price level is sufficiently small that usually one can calculate the effect of what its action will be on the entire market. My own opinion would be that the number of major firms in the Canadian farm implement industry is small enough that one would naturally expect to find some degree of price administration. When you look at the actual record of the industry and find that during a period when the demand for their products was falling very sharply they were still able to increase their prices, I think this is pretty conclusive evidence that there is some degree of price administration in the industry.

Mr. ARGUE: You are not accusing them of forming a combine in the sense of coming under the Combines Investigation Act?

Mr. COBURN: Not at all.

Mr. ARGUE: But what they could bring about by the method you suggest is a fixation of prices that has precisely the same effect?

Mr. COBURN: Yes.

Mr. ARGUE: Which price is at the point the company wish it kept, and since there are but few in the industry, if all keep at that place, they will keep the price there.

Mr. COBURN: Yes. Suppose you have an industry with three major firms—

Mr. ARGUE: Is that correct, in this case?

Mr. COBURN: I think there are slightly more than three, but not a great many more, if you leave out the small firms. If you take firms A, B and C, and find they are all selling at a given price. Firm A may say: "We would like to increase our sales." Again, following the old-fashioned competitive theory, what they would do would be to reduce their price in order to increase their sales, at the expense of firms B and C. But, they know perfectly well that if they do that, B and C will also reduce their prices to the same level. Then, they all will have a reduced profit, in all three firms, and from their point of view they will all be worse off than before. Therefore, they do not reduce their prices. There is no collusion between them, but it operates in the same way.

Mr. ARGUE: When you see there is a price increase in a farm implement—let us say in the case of a very common type of tractor—can you give us some idea of how it comes about? Does Massey-Ferguson put their price up 7 per cent and then Cockshutt comes in with a similar increase, and so on, so that after a matter of a few weeks the end result is that the prices have all gone up by approximately the same amount, for approximately the same type of machine.

Mr. COBURN: I think the way this comes about is simply that Massey-Ferguson, if they are the first company to act, know that if they push prices

up, one of two things will happen—either the other companies will hold the line and Massey-Ferguson will have to bring their prices down again, or the other two companies will say: "Here is an opportunity to bring our prices up safely, too", and the other companies will follow suit. That is generally speaking what would happen.

Mr. ARGUE: It usually happens the latter way?

Mr. COBURN: Yes.

Mr. ARGUE: There has not been a company in recent years which has been reducing its prices?

Mr. COBURN: No.

Mr. ARGUE: You have never heard of one in your knowledge?

Mr. COBURN: No.

Mr. ARGUE: Could you give this committee some idea of the unemployment in the agricultural industry today?

Mr. COBURN: I have not seen the latest figures, but the last figures I did see showed that employment was about not more than two-thirds of what it was eight or nine years ago.

Mr. ARGUE: Is there a recent improvement—better than it was a year ago?

Mr. BURT: It has been getting a little worse.

Mr. ARGUE: It has been getting worse?

Mr. BURT: Yes.

Mr. ARGUE: If there were a greater demand for farm implements, there would be a larger amount of money in the pockets of purchasers, this would bring down the wage costs in the farm implement industry in relation to output?

Mr. BURT: Yes.

Mr. ARGUE: And this would make it a very happy situation as far as U.A.W. is concerned?

Mr. BURT: Very happy. We are faced with two things—technological changes taking place in this industry, as well as in every other industry, and the farm income, which I see is getting a little better, according to recent reports, but has been very poor. These things conspire against us in trying to get our people back to work.

Mr. ARGUE: Do you have any liaison or any cooperation of any kind with any farm organization? Do you discuss some of your mutual problems with any representatives of farm organizations?

Mr. BURT: We sure do. We have had, at our farm implement council meetings here in the last few months, representatives of the farmers' union, the Canadian federation of agriculture, and the Ontario federation of agriculture. Those organizations make their own submissions—I presume they have made them here. We have a knowledge of the manner in which they are making their approaches and they sat in while we were compiling our memorandum.

Mr. ARGUE: You at least have some common ground in dealing with the problems of the farm implement industry?

Mr. BURT: Yes, we are trying to get a meeting with the cabinet, by the way, to present another brief. It is a more detailed brief, on the agricultural implement industry. So far, we have not been able to get a meeting with the cabinet. They say it is not their practice to discuss these things while they are being discussed with a parliamentary committee, or Senate committee.

The CHAIRMAN: Why did you not present that additional brief to us this morning, then?

Mr. BURT: Because this is beyond your terms of reference, in our opinion.

Mr. ARGUE: And it has to do with more than farm implements? What else?

Mr. BURT: There are other things concerned in it, including farm income.

Mr. ARGUE: The Prime Minister will not hear you? That is a terrible situation.

The CHAIRMAN: Order.

Mr. ARGUE: This is scandalous. This is a free country. Surely they could see the cabinet.

Mr. BURT: We are dealing with things which are beyond your terms of reference. In dealing with problems about the farmers, we go into the things we have learned as a result of our association with the farmers organizations. We couple the two together because unless the farmers are getting a decent break, then the agricultural implement workers are not going to get as much work. We know that.

Mr. ARGUE: I would like—

Mr. HORNER (*Acadia*): I want to ask—

Mr. ARGUE: I have got the floor, Mr. Chairman.

Mr. HORNER (*Acadia*): I also had the floor.

Mr. ARGUE: I did not interrupt Mr. Horner.

Mr. HORNER (*Acadia*): I had a supplementary question to put, but if you have not finished, go right ahead.

Mr. ARGUE: I am wondering if the witness would care to say, in the event that the cabinet continues to refuse to hear this presentation, whether you would be prepared to make the presentation to the committee—either that one, or some other one which might be comparable—dealing with the farm income question as it might affect the farm implement industry and the people you represent. I think it is very important from the farming standpoint, and from the farm implement standpoint, that something be done about farm income, and that in itself will have some very considerable bearing on farm implement costs.

Mr. FORBES: I think the farmers are quite capable of presenting their own case, without asking the implement people to come in here to do it for them.

Mr. ARGUE: You have been talking about the farmer and labour fighting amongst themselves. I want to ask some further questions.

Mr. HORNER (*Acadia*): Let us hear the answers to the previous questions first.

The CHAIRMAN: Might I remind the committee and witnesses that only one person should speak at a time, in asking a question or giving an answer. Our reporters have difficulty enough in catching comments, as it is.

Mr. ARGUE: I understand the witness will answer my question. I have a supplementary question now. I would like to know whether or not he is prepared to give this committee, either now or at another sitting, the benefit of the work done by U.A.W. on the question of farm income, and the other matters that the U.A.W. is endeavouring to see through and about which it is finding it hard to see the Prime Minister.

Mr. BURT: If the cabinet does not see fit to give us an appointment, we want to air our brief, and I think the council that is present here would, of necessity, almost have to consider a presentation here, if your terms of refer-

ence extend that far. One of the reasons we have not mentioned these things in here is that we felt we were restricted to your terms of reference and we have confined ourselves, as you can see, to our analysis of the prices of agricultural implements in Canada. In this other brief, however, we go into the farmers side of it and, incidentally, the farmers' organizations have complimented us on our preparation of this document.

Mr. KORCHINSKI: You have given this for the benefit of the farmers' organizations before you presented it to the cabinet?

Mr. BURT: We have already sent copies to the Prime Minister, but this second brief has not been circulated very widely as yet.

Mr. ARGUE: I have another question. We have been told already this morning that at one time when U.A.W. was negotiating with the automobile companies for an increase—I do not want to misinterpret what you said, but this is as I understood it—the automobile companies were told by you: "If you reduce the price of automobiles by \$100, we will forgo any increase or take into consideration that reduction or just what the picture is." We have been already told, on another point this afternoon, that the United Steelworkers, at one point, had some negotiations and said to the steel companies: "We will forgo a wage increase at this time if you will forgo a price increase in steel." I am asking now whether or not the U.A.W., in dealing at any time with the farm implement companies, has made an offer of this type, or whether U.A.W. would be prepared to consider some kind of a general offer, that if the farm implement companies held the line or reduced the price of farm implements to the agricultural producers, that the people employed in this industry would give some consideration in their wage demands to this fact.

Mr. BURT: We have never made that proposal to the agricultural implement industry. We had a reason for it. At the time it was made, in the case of the automobile industry, before it was made by President Reuther in the United States, we were loth to make it, because we never figured that the rates of pay in this industry were high enough to justify making it, for one thing. The other part of your question is a delicate one and Mr. Kidd has already expressed himself on it. In the next few months we will be thinking about approaching the agricultural implement companies and some of them in the automobile companies, too; and I do not think it would be wise for us to divulge here to anybody publicly just exactly what we would bring up, as far as negotiations are concerned. Let me say that there are many problems which exist now in industry, as a result of technological changes and mass layoffs, that affect the situation drastically and particularly in some parts of industry in respect of technological change. We are giving that all the study we can at the present time, because, as one gentleman said here, in regard to several machines being replaced by one big machine, it is the same in the case of labour costs, sometimes one large machine is put in and you lose 20 men. While the machine will show up in the capital expenditure of the company, it does not show in the company's financial statement the loss of human effort, thrown on the streets, who are an expense on the government and on governments generally. Those things must be studied before we can even formulate our plans for a 1961 approach to companies in negotiations.

Mr. HORNER (*Acadia*): I have just a quick supplementary question on the organizing picture. As you are probably aware, we had before us three of the biggest implement manufacturers operating in Canada. Two of them suggested—I was not here for all the evidence given by the third—that the amount of money they are spending on research and development is increasing every year to where they are now spending between 3 per cent and 4 per cent of their total sales on research and development. When we asked why they were spending so much on this, one of the companies said—and

I can remember quite clearly—that labour organizations have got to such a point where it pays them well to spend a little extra money on trying to bring about technological changes in the factory in order to cut down on labour costs. My question is, have you at any time considered the fact that there may be more men employed, if wages had not gone up to 102 per cent since 1947—using your own figures?

Mr. BURT: Even if wages had been twice as high, I do not think it would have stopped the progress of technological change. I do not think I am naive enough to believe that. Companies make progress along the lines of progress that are made generally. We are all making it, I suppose. I do not think wages play a part. I do not think they are given consideration in respect to the company's plans and research and so on. I suggest, also, that some of this research with American subsidiaries is done in the United States. We have found that very little of it is done in Canada. We would like to see more of it done in Canada. We would like to see more of these large American corporations do more of that research work in Canada, to meet some of the needs of Canada.

Mr. HORNER (*Acadia*): I might follow this up with a little further questioning, sir. In regard to employment and the numbers employed, you said yourself, Mr. Burt, that some of the foreign countries have a wage advantage over Canada. I think this was said this morning by Dr. Forsey in answer to a question by Mr. Muir. We noticed that in figures presented to the committee, our imports of agricultural machinery are going up, and some of the countries are now starting to import quite large parts. For example, Massey-Ferguson said that they are importing some of their tractors directly, and some of the parts of the tractors already built as a unit, like the transmission or the motor, or something else, and they are coming in ready, lock, stock and barrel. Another company said they are starting a factory in Scotland, for example. Do you not think that the companies are considering wage costs in doing this, in having more of their manufacturing done outside Canada and the North American continent?

Mr. BURT: I think they have all this in mind. I am trying to be clairvoyant and read the minds of the companies I am occasionally in contact with when bargaining across the table. They also want to capture the market in the countries to which they go.

Mr. HORNER (*Acadia*): I agree.

Mr. BURT: In any case, the market has been considerable, as a result of the Marshall plan and the expenditures in Europe. As you know, the Europeans are catching up with us, starting to produce and they have a market at their back door which is tremendous. They are in a good position to compete with us. There is no doubt some of these companies find it more profitable. It is not always profitable for Canada to establish plants in Europe. There is one in Great Britain, in Scotland now which has been operating for some time, and there is no doubt that wage rates are lower and the cost of living generally is lower in those countries. However, I do not think it would be suggested, for example, that we lower our living standards to the low level of the Japanese in order to recover our radio tube industry, or things like that.

Mr. HORNER (*Acadia*): No, no.

Mr. BURT: The same thing applies.

Mr. SMALLWOOD: Before I start on this I want to say that I am not condemning either labour or the machine companies, but I speak as one who feels there is something drastically wrong. I am a farmer, and I know that we cannot stand for more increases in the price of machinery. We cannot buy at the price, so if labour is going to continue seeking higher wages, and if

industry is going to increase the price of the machinery, we will be going out of business. We will not be able to buy and that would mean more workers will be going out of your industry, because we cannot buy the machinery. There has been talk about the price of farm produce being too low. I know it is low, but if we raise the price of the farm product, up goes the cost of living, then you go on strike for more wages, then the companies increase your wages and up goes the price of machinery. You want more for your product, and up goes the cost of living, then you go on strike for more wages. Where is that going to end?

Mr. BURT: Let us get on the merry-go-round together and perhaps we could find a solution. It is not true to say that all we do is say: "We strike, we strike, we strike". If there is anything I do not like—and I know I speak for the council—it is a strike.

Mr. SMALLWOOD: I know.

Mr. BURT: It is a popular idea amongst the farmers, and a most erroneous one. Perhaps the farmers ought to go on strike—and let me tell you, if you do, we will support you in a strike, because we believe you should get a share of the economic wealth, as well as the workers.

Mr. SMALLWOOD: We are not going to do that.

Mr. BURT: I know you are not. We have proposed to our government on numerous occasions, and still propose it, that they form an industrial committee composed of farmers, trade union representatives, farm implement manufacturers and the government, that that constitute a permanent committee, and that then we sit down and analyse these things.

Mr. HORNER (*Acadia*): Is that not the same as a productivity council?

Mr. BURT: No, it is not the same as a productivity council, particularly when you have a selected productivity council and not a recommended one from the various groups. We do not believe in that kind of thing. We believe that if there is to be a representative of labour in it, the national labour organizations should be asked to send a representative. The Prime Minister should not pick the representatives.

Mr. SMALLWOOD: How are you going to give the farmer more for his product? I say that if you give him more, there will be increased wages. How are you going to give him more?

Mr. ARGUE: Fire the government. Change the government.

Mr. HORNER (*Acadia*): Where will the money come from, Mr. Argue? Will you start to print it?

Mr. SMALLWOOD: I have asked a question.

Mr. COBURN: Part of the solution may be found in the fact that during the period when the prices that the farmer was getting for his product were simply disastrous, the price of food continued to go up.

Mr. SMALLWOOD: You have not answered my question yet. How are you going to make it higher?

Mr. COBURN: It seems to me that the farmers would need to get together in some kind of organization in order to make their strength felt. This has been a problem for farmers for a long time.

Mr. SMALLWOOD: We are agreed on this.

Mr. COBURN: It would be presumptuous of us to come in and tell the farmers how to organize. They have to work out solutions to that problem.

Mr. SMALLWOOD: So the farmer is to get more for his product. How do you suggest he will get more?

Mr. COBURN: Organize, and use your economic strength.

Mr. SMALLWOOD: How is he going to get it?

Mr. COBURN: You may have to get a government that will give you some legislation to enable you to get it.

Mr. SMALLWOOD: I want to see these things put together.

The CHAIRMAN: We had better get back to this question of investigation of the price of farm implements, and away from politics.

Mr. BURT: I cannot answer the questions unless there is a little bit of order.

Mr. KIDD: We were asked a question as to how you would get it. I do not know if you have read the report of the royal commission on the prices of agricultural products, or perhaps you would not ask this question. It was found by that committee, after a couple of years of investigation, that the farmers in fact had no more bargaining power. They had all fallen back into the hands of the processors and retailers. They had no chance to bargain against those powerful economic interests, and until such time as they right that balance I do not think they are going to get anything more for their products.

Mr. SMALLWOOD: I have a supplementary question. There is a piece here from the *Hamilton Spectator*, which says:

A three-year contract providing increases in wages and fringe benefits for 2,150 workers has been settled by Local 2868, United Steelworkers of America, and International Harvester Company of Canada Limited.

Union staff representative Stewart Cooke said the pact was worth 25.1 cents an hour over the period starting from April 23.

Is that right?

Mr. BELLINGHAM: In which year?

Mr. SMALLWOOD: It was 25 cents in one year.

Mr. BELLINGHAM: We dserved it, also.

That was the last contract that was signed last year.

Mr. SMALLWOOD: Mr. Argue asked you if you ever considered holding the line of wages if the company would hold the line of machinery prices, and he said he thought it called for investigation.

In your local bulletin, "Local 2868" dated April 28, 1961, under the heading "wage increase", you say:

By this time next year we will have a new agreement, or be in the midst of bargaining for one.

Prices have held, but you are bargaining for more.

Mr. BELLINGHAM: It does not say that there, does it?

Mr. SMALLWOOD: No.

Mr. BELLINGHAM: I know. I wrote it and I know what it says. It does not say "wage increases". It does not say that we are bargaining for wage increases next year. It does not say we will not, but it does not say that we are.

Mr. SMALLWOOD: It is under the heading here of "wage increase".

Mr. MANDZIUK: Does it mean you are bargaining for a reduction in wages?

Mr. BELLINGHAM: This is spread over two years.

I am an economic research man and I work in a research plant, and these 20 people sitting at the back of the hall are working there too. A question was asked this morning and I would like to answer it. I have been with the Harvester Company for 19 years and in those 19 years there were technological improvements in the plant and there was a speed-up and a work load increase

in the plant, but that did not mean any increase to the workers in Harvester, since 1947—and do not let anyone tell you it did. We see that every day the company is producing with less people all the time, and yet producing more. I do not care which company tells you a different story from that, it is not true.

There is another point I wish to clear up. It was a statement by a representative of the company I work with, that real estate and business tax had gone up 280 per cent. It was mentioned this morning. I wonder if that company official told you that, in that period of time, they had put \$15 million into new buildings in Hamilton and that would naturally increase their real estate and business tax. Surely, they did not expect to put up buildings without having the taxes go up?

Mr. SMALLWOOD: Did you say there was a productivity increase?

Mr. BELLINGHAM: Yes.

Mr. SMALLWOOD: What yardstick did you use?

Mr. BELLINGHAM: Our own eyes.

Mr. SMALLWOOD: One company submitted figures showing the product shipped from the factory per ton, hourly and piecework employed, that it did not increase from 1954 to 1960. This company admitted that some defects could be pointed out in this method of measuring productivity, some that would indicate a little increase, while others would indicate a decrease.

However, the figures were there, so I was wondering what yardstick you used.

Mr. KIDD: It is curious that International-Harvester can talk in terms of falling productivity. I read a press release, but did not read *Hansard* on it. In view of the experiences we observed as Mr. Bellingham says, we know this company has expanded greatly in the past little while. It would scarcely seem to us reasonable to expect the company to expand greatly if labour costs and other costs were high. One would have thought they would have disappeared completely from Hamilton and have run away to some other part of the country or to some other country. The fact of the matter is that this plant in Canada has to bid for the products it makes, against other parts of the International-Harvester Company across North America. It has to be able to produce these tractors and grain drills and items like this at a better cost than the other parts of the Harvester operations over the world. If they can bid successfully in Canada, and if—as in fact they are doing—they can produce tractors and windrowers here, it means their costs of production are lower here in Canada than elsewhere, and it means their productivity has been increasing in the past few years. It seems to us that there must be statements that this company wants to make—one for public consumption and one we get in our negotiations—which are quite different. They tell us these things in negotiations. We can only assume that the efficiency of this plant of International Harvester is amongst the highest in the industry in North America. Therefore, the productivity is good and, therefore, the labour cost is low.

Mr. SMALLWOOD: Do you feel that you have worked efficiently, that you have put out a good product in your day's work? Do you feel that your work is as efficient in the shop as it was?

Mr. KIDD: I would say that the efficiency of this plant has increased many fold in the past ten years.

Mr. SMALLWOOD: We get some machines which are very crudely made.

Mr. BELLINGHAM: We make them, but they design them.

Mr. SMALLWOOD: There was a blockman being taken through a factory by an official and this particular man was making the crankshaft for a machine. When the worker was putting it on the jigger, this blockman noticed that the

alignment was out. He got off the jigger and said to the official of the company: "Have that put on again, because that is out of alignment". He said: "Put that back on the jigger." Then the guy turned to the official and said: "You go to hell." When they had passed on, the blockman asked the official: "Why did you let him talk to you like that?" He said: "That is the way they have got us down here; if I said anything to him—" That piece of machinery went through and some farmer bought it.

Mr. KIDD: He would be fired immediately—instantaneously.

Mr. SMALLWOOD: I have heard things like that.

Mr. FORBES: On the same subject of costs, the International Harvester people presented us with the cost of manufacture of a field cultivator in the company, and the material, the machine tools, and so on, were 46.20 in 1955 and 46.91 in 1960. The total labour costs for manufacturing that cultivator were 43.4 in 1955 and 44.38 in 1960. If it cost 44 per cent for labour for manufacturing the cultivator, that is a sizable item in the cost of manufacturing that product. Do you agree with those figures?

Mr. BURT: No.

Mr. KIDD: I do not believe it. I would like to see it clarified.

Mr. BELLINGHAM: This is the actual labour cost you are giving?

Mr. FORBES: It is the total labour cost.

Mr. BURT: Does that include salaries, executives' salaries?

Mr. FORBES: It includes factory wages, plant and everything, fringe benefits and shipping costs, 43 per cent. That is all labour and the labour for the materials is not taken into consideration. If it were, it would amount to more. Machine companies indicate to us that a lot of the machines are put together on piece work.

Mr. BURT: Yes, that is their system.

Mr. FORBES: Who arrives at the cost of piece work? Is that negotiated by the unions?

Mr. BURT: The company devised the method by which the standards set are their standards, and then they negotiate on prices.

Mr. FORBES: That is between the unions?

Mr. BURT: Between the unions and the company, but they have the right and often exercise it, during the contract term—and this is one of our complaints—they often change part of the method, and so on, and if they institute a change it makes a guy go faster for the same money. This is quite a common problem which we have now.

Mr. FORBES: We are trying to arrive at the cost of manufacturing machinery. You fellows admit you do a certain amount on piece work?

Mr. BURT: Right.

Mr. FORBES: Suppose you were putting together a pick-up for a combine, would you know what price you got for that in 1947, and again in 1960?

Mr. BURT: It might be entirely different equipment. There might be an entirely different method of making that implement. I can tell you this, that some of the time studies on which prices are based in a company like, say, Massey-Harris, were in effect for years and years; there has been the same study, but in the last few years the company on its own initiative has changed a lot of these time studies.

Mr. FORBES: But the pick-up is identically the same thing as it was ten years ago.

Mr. BURT: It may not be made in the same way.

Mr. BELLINGHAM: It may not be made the same at all.

Mr. KORCHINSKI: Earlier, I think the witness indicated that the cost of living did not go up quite as readily as the average hourly rate. Is that right?

Mr. BURT: That is true.

Mr. KORCHINSKI: You also indicated that you had some brief to present to the government and you hoped that perhaps the farmers' returns could be greater so that you could sell more and the whole cycle would be improved, that is to say, if there were more jobs, there would be more sales, and so on. Do you really believe that would happen?

Mr. BURT: I do not see why it should not.

Mr. KORCHINSKI: You also said in your brief, on page 11, that the upward pressure on prices came primarily from a pressing demand. There was a demand that would naturally follow, would you say, if the farmer had more, and so on? You also stated:

The producers charge more because they could get more... and the farmers could pay more because of their higher cash incomes.

In other words, you are saying that if the farmer got more, whether it is the manager or the manufacturer who notices this, he then asks more, and then you can demand more. You can readily see, as I said, the cost of living did not go up. However, your wages did increase. On page 48 of the Saskatchewan wheat pool brief, volume I, it says:

A 7-quarter farmer in District 14 said: "It seems superfluous for me to say that machine prices are absolutely out of line with prices received for farm goods. For instance, in 1947 I paid the equivalent of 1800 bushels of No. 2 wheat for a 12-foot combine. In 1952 I paid the equivalent of 3800 bushels of No. 2 wheat for a 12-foot combine, and in 1960 the same 12-foot combine would have cost me 6400 bushels of No. 2 wheat.

If that farmer has had a declining return from his production, you have not indicated a solution, nor has management, if that is what you want to blame. Apparently you do not want to take any of the blame—but I notice you make reference that you should have an average return for hourly earnings, of an hourly wage earning of industry, \$2.02 in 1959. I notice that in 1946 you have 81 cents per hour. Now you compared that with durable goods earlier this morning. For 1959 it was \$1.87, and for 1946 it was 77 cents. In other words, in 1946 there was a difference of 4 cents per hour. By 1959 you have reached a point where there was a 15 cents difference between the durable goods. How can you indicate that by increasing the farmers' return there could be any salvation for him at all if these are going to gather there like hawks ready to pick up that little bit of improvement.

Mr. BURT: We did not give you these figures which you are quoting.

Mr. KORCHINSKI: These are figures from the bureau of statistics. You must have got your figures from there. I am giving those figures.

Mr. BURT: We are not down here to defend ourselves against anything. We are down here with the facts, and we say—in spite of the fact that wages have gone up, there is no doubt about that—we do not think our agricultural implement workers are making enough yet. They are not enjoying a really good standard of living, and they cannot afford to buy, any more than the farmers can, the things they need in their homes. If the Canadian farmers and workers were able to buy the things they need now and should have, we would have most of industry at work. But they cannot do it.

Mr. KORCHINSKI: Also, in your brief, on page 11, you speak of a 43 per cent drop in the volume of production and you say:

It is quite remarkable that unit wage costs did not rise much more than 22.6 per cent.

The fact that the production went down did not indicate at all that you were prepared to take a reduction. In other words, the farmers' income had gone down by then. The price charged had to go up per unit, but you still asked for an increase. Also, with reference to what Mr. Smallwood indicated here earlier, in a reference to a number of tons, on page 551; this is with reference to the International-Harvester presentation chart, which stated that in 1954 23 tons per year per hourly paid worker was the amount put out. In 1955 it was 27.6, in 1956 it was 27.4, in 1957 it was 24.8, in 1958 it was 26, in 1959 it was 23 and in 1960 it was 23.4. These are their figures and the witness said he merely did not agree, but these are their figures and he would have to take their word for it. You have not anything to comment on that?

Mr. COBURN: I would suggest that these figures are meaningless, because I do not know how they were made up. These implements are very complicated and the employment on them is increasingly so. I do not see how you can measure productivity in terms of tons per worker.

Mr. KORCHINSKI: You said the volume of production had gone down in 1952 to 1958. You yourself stated that in your brief.

Mr. BURT: Where are you quoting from?

Mr. KORCHINSKI: From page 11 of your brief.

Mr. COBURN: Yes, production went down.

Mr. BURT: If efficiency went down, the tonnage per member would go down.

Mr. KORCHINSKI: So the over-all cost went up.

Mr. COBURN: Employment went down.

Mr. KORCHINSKI: Your labour cost did not go down; you were prepared to take it, like the farmer was. What good is it to the farmer if your wage increases, if you do something?

Mr. BURT: Our product per man went up and it did not cost the company any more to give us the increase we got.

Mr. KORCHINSKI: It did. Who is the customer?

Mr. PETERS: I have a supplementary question to ask. Is it not true that what you are suggesting in these sentences to which Mr. Korchinski referred, is that the producer charged more because he could get more and the farmer could pay more because of his higher cash income. Your contention is, is it not, that the price of farm machinery would go up with the price the farmer would receive for his product. In other words, if his condition is better, it would mean more production, because the farmer could buy a more expensive machine, could buy more in quantity of machines, and this would in turn lower the cost per unit as far as the machines are concerned, and would allow the worker an increase in wages, and this would not necessarily mean a cost increase, but on the contrary, it would lower the price and at the same time the workers would get more money, provided the farmers were able to buy more machinery.

Mr. BURT: I think that is a fair statement.

Mr. KORCHINSKI: I do not need more machines on my farm. I have got enough already.

Mr. BELINGHAM: I can answer this, as a person who works for his living in a shop. I am not naive enough to believe, and I know companies well enough

to say, that if I produce more and even went along with a wage reduction, that it would do your people on the farms any little good; because I am convinced that if there was any reduction in the cost price of farm implements, even through a reduction in wage costs, it would not be passed to the farmers. If you think it would, keep on thinking so, but it would not.

Mr. KORCHINSKI: I would like to hope so, but you have already indicated that you will have to acquire more.

Mr. MANDZIUK: I have been waiting impatiently to get my nickel in. I have searched through the brief to find where I could find a part on which I could compliment you gentlemen on the work you have done, and I find that there is a sentence on the first page, the last sentence there, which I really like. It says:

It is also a matter of great concern to farm implement workers, since needlessly high prices cut down the demand for our products, and this means less work and wages for us.

My question is based on this. How do you reconcile that with the principles expressed in your labour publications? The same thoughts were expressed in your presentation to the government last February, I believe, for shorter hours and higher wages, regardless of what happens.

Mr. BURT: You are basing all the increase in costs and high prices—as so many people tend to do today—on the cost of labour. We have tried to point out in this brief that labour cost represents only a relatively small proportion of the total over-all cost, and that productivity in its relationship to wages is a real key to this problem. You seem to disregard that completely. Let me tell you that if the technological changes keep the pace at which they have been going in recent years, in another ten years we will probably be demanding less hours of work and more money.

Mr. MANDZIUK: That would be a novelty.

Mr. BURT: We would be justified in doing so. Do not forget that there is a break on labour at the bargaining table. We happen to be bargaining with the most powerful financial interests in this country and in the United States, too. You seem to be of the opinion that every time we ask for ten cents an hour from the boss, he says: “Yes” right away, because he is defenceless in the face of such powerful labour organizations. That is just nonsensical. In the first place we represent only one-fifth of the total labour force in Canada. We have the agricultural instrument industries pretty well organized throughout the country, it is true; but on the over-all picture we only represent a small proportion of the labour force. The biggest rise in the government index is shown over the last few years in the food index. The food industry is not organized in the big service industries. With the farmers prices going down, tell us how it happens that the food to the agricultural implement worker has gone up, at a time when the income of the farmers is going down?

Mr. MANDZIUK: I can tell you why.

Mr. BURT: Very well?

Mr. MANDZIUK: I can answer that. At the time the prime product of the harvest leaves the farmers’ hands, it goes into the hands of the processor, and labour is in it. That is how it works.

Mr. COBURN: May I read you what the royal commission on food prices said about that?

Mr. MANDZIUK: I have read it.

Mr. COBURN: It said:

The falling prices of food industries paid for farm materials and the higher prices they obtained from consumers confronted the industries with circumstances conducive to profitable operation and expansion.

Mr. MUIR (*Lisgar*): You must understand, sir, that the consumer today will not take a paper bag with a dozen eggs to carry it home. He has to have those eggs wrapped in a special carton. This goes right down the line.

Mr. COBURN: I know this is the case and the royal commission took that into account, that the food processing industry had increased the price of the products primarily by paying the farmer less and charging the consumer more.

Mr. MANDZIUK: I agree you gentlemen have a problem, but the farmer has a problem, also. Have you read the brief presented for the farm workers organization and the brief presented by the retail association?

Mr. COBURN: No.

Mr. MANDZIUK: If you did not, you should have, because those briefs give us the impression that the price squeeze is on both of these, on the farmer and on the retailer of farm implements, and it comes from labour and industry.

Mr. COBURN: This impression has been very widely spread by some of the highest paid propagandists in this country.

Mr. MANDZIUK: Those are facts, and our duty is to find out what causes this price squeeze. You are a factor. Will you not admit that even your brief is one-sided and biased? I put that same question up to the International Harvester company. Every brief presented here is coloured. All you are interested in is your own problem, and, I suggest, "to the devil with the rest".

Mr. COBURN: I would not say that is a fair comment. Certainly we have presented our point of view.

Mr. MANDZIUK: There is no mention of the farmers in this brief.

Dr. FORSEY: You quoted it yourself, from the first page.

Mr. MANDZIUK: Yes, but you do not follow that principle.

The VICE-CHAIRMAN (*Mr. Smallwood*): Are you through, Mr. Mandziuk?

Mr. MANDZIUK: No. My question is this: do you admit your brief is coloured and one-sided?

Mr. BURT: If we say it is coloured, then so is the D.B.S., because we have relied on their figures. As a matter of fact, one of the members of this committee said he accepted the figures of D.B.S. We have got all our figures from the D.B.S.

Mr. BOULANGER (*Interpretation*): In the preparation of your brief, did you take into account the net revenue of the farmer in constant dollars, and the net revenue of the worker in constant dollars, on a 1949 basis?

Mr. COBURN: In the brief we still hope to present to the cabinet, we have made some analysis along those lines. We did not do it in the brief presented to your committee today because we were under the impression that the committee's terms of reference did not extend to the whole problem of farm income.

Mr. BOULANGER (*Interpretation*): I have figures here, D.B.S. figures, which are based on constant dollars. In 1947, for instance, in constant dollars, the farmer's income was \$1,019; in 1952 it was \$1,651, and in 1960 it was off again to \$1,175. So far as a worker's income is concerned, from 1947 to 1960 there has been an increase from \$2,004 to \$2,571, and both these are constant dollar figures. Do you not feel that this factor—that there has been a drop in the farmer's income—is attributable to the fact that the farmer is not organized, while the worker is very powerfully organized?

Mr. BURT: I believe that is primarily true.

Mr. BOULANGER (*Interpretation*): I note that there has been an increase from 1947 to 1960, so far as the worker is concerned, of approximately \$500, and a similar decrease of about \$500 in the corresponding period for a farmer's

income, so I do feel the crux of the problem is that so far as the prices of agricultural machinery are concerned, it is that the income of the farmers has gone down, rather than anything else.

Mr. COBURN: As a matter of fact, in the larger brief we prepared we suggest the problem of falling farm income was really much more responsible for the farmers' problem than increasing prices, although we recognize the fact that prices have increased. It seems to us that the major problem of the farmer is the fact that his income has been falling, while the incomes of the rest of the population have been going up.

Mr. MANDZIUK: Conversely, if industry and labour held the line, to which request labour has strenuously objected, do you not think that would have alleviated the farmers' plight?

Mr. COBURN: No, I do not know. The increase in constant dollars, from \$2,000 in 1947 to \$2,571 in 1960, a little over 25 per cent, is certainly no more, and I would rather suspect somewhat less, than the increase in productivity per worker in the economy, and what would have happened if the worker's wages had simply remained at the same level in buying power in 1960 as they were in 1947? Industry's sales would also be at the same level in 1960 as they were in 1947, and this country would be in the middle of the worst recession you have ever seen.

Mr. MANDZIUK: Mind you, I am not absolving industry from any blame. To give the farmer a reduction of 20 per cent, 15 per cent or 5 per cent in the price of farm machinery would make him a little happier than he is today. Our duty is to find out why he is paying so much for his farm equipment, and that is the way our report will read. This is just a statement, not a question, and I hope you gentlemen do not think we are trying to cross-examine you. We are going to have a wonderful time sifting all the material we have received and then making our report or recommendation. That is our difficulty, and I hope you realize our questioning is not to be taken as in any way antagonistic toward labour.

Labour, unlike the farmer, is organized. The farmer cannot strike. He cannot hold his wheat, his eggs or his butter indefinitely. He cannot stop milking his cows. The farmer is not in the same category as you are, because you have that last weapon. You can strike and you can keep the unemployed from entering a certain factory where they would be only too happy to fill your shoes. You can declare a strike, and you can compel management to give you your wages. I only wish the farmer was in that situation. I think he would be happy, but he cannot do that now.

The VICE-CHAIRMAN (*Mr. Smallwood*): Order.

Mr. MUIR (*Lisgar*): Do you feel that Canadian farm implement costs are definitely a grievous point?

Mr. BURT: You mean the company costs?

Mr. MUIR (*Lisgar*): Yes.

Mr. BURT: You mean the selling price?

Mr. MUIR (*Lisgar*): I should say the prices.

Mr. BURT: We think the companies could certainly make a reduction, according to these figures.

Mr. MUIR (*Lisgar*): You make the statement with the knowledge that the machine companies compete with the Americans on a continental basis, in spite of high transportation costs and low plant efficiency, and in referring to plant efficiency I am not putting all the responsibility on labour. If the Canadian manufacturers' prices are unduly high, surely the American

manufacturers' prices must be out of reason altogether, because the Canadian companies are competing on a tariff free basis with them. Do you have any comment to make on that, sir?

Mr. BURT: What you are saying is that we say that Canadian companies compete on an even-*stephen* basis with the United States companies, and, as their rates of pay are much higher than ours, their prices must be higher. Is that what you are saying?

Mr. MUIR (*Lisgar*): I would say their efficiency is that much higher and their transportation costs are much lower, particularly in the middle west, and yet our companies are still competing with them in the west.

Mr. COBURN: My impression is that you are hanging your argument on the same point you were discussing earlier, on your claim that the efficiency of the Canadian plants in the agricultural implement industry is lower than it is in the United States plants. I doubt very much if there is any evidence to support that. It may be true of secondary industries as a group in Canada but, as Dr. Forsey pointed out earlier, most secondary industries in Canada are only able to produce for the limited Canadian market, while the agricultural implement industry is able to produce for the whole North American market. Had the other industries the same market open to them as the Americans, I see no reason to believe their productivity efficiency would be any lower than in American plants. The Americans certainly have the advantage of the wage differential, and I do not think there is the same productivity comparison.

Mr. MUIR (*Lisgar*): We have had evidence submitted by the machine companies in which they told us that their plant efficiency is not as high in Canada.

Mr. COBURN: Could you give us facts and figures?

Mr. MUIR (*Lisgar*): They gave us an illustration of the type of equipment they had in their plants, for making castings and bearings, and so on. That plant, they told us, is much more efficient in the United States than it is in Canada. They admitted to us that our plants are not as efficient as the American plants.

Mr. COBURN: As Mr. Bellingham has just mentioned to me—and he works in the plants—in the case of some products that may be true, but in the case of other products our plants may be more efficient.

Mr. SLOGAN: Is it not true the main reason we have the market in the United States is not so much efficiency but the wage differential? Massey-Ferguson submitted figures to us showing that the wages in the United States are 27 per cent higher than they are in subsidiaries in Canada, and once that differential is wiped out we shall lose that American market.

Mr. COBURN: I do not know how much difference that wage differential makes.

Mr. SLOGAN: It makes 27 per cent of a difference.

Mr. COBURN: Massey-Ferguson is a good illustration. They built themselves a large plant in Detroit when they had only to move across the river and build that plant in Windsor, where they would have enjoyed the wage differential. There is no reason in the world why they could not have just as efficient a plant in Windsor as in Detroit, because the difference in transportation distance is only about two miles. However, they made their decision to locate their plant in Detroit, and the only conclusion I can come to is that there were other factors which they found much more compelling than the wage differential.

Mr. MUIR (*Lisgar*): Of course they made the same decision when they built their combines plant in Toronto.

Mr. BURT: However, in the case of combines Massey developed a rather unique piece of farm equipment many years ago, and they captured the market

for it in the United States and Canada. As a result they had an advantage, an initial advantage, which was not enjoyed by the other companies.

Mr. BOULANGER (*Interpretation*): I have another question on a different line. I should like to ask the witness if, in order to increase productivity, there has ever been any study made of the possibility of some profit-sharing arrangement with management?

Mr. BURT: No.

Mr. BOULANGER (*Interpretation*): The reason I am putting the question is because I am a manufacturer myself, and in my own plant I have put a profit-sharing arrangement into effect, which has enabled me to increase productivity by approximately 100 per cent, thus enabling me to compete better. I feel it is a good principle that could be applied to industry generally.

Mr. BURT: Our union, the U.A.W., made a proposal in negotiations two years ago that a study be made of the possibility of such a plan, but it was rejected by the employers in the automobile industry, and we did not find any employer who was even sympathetic towards making a study of it, or even considering it. May I add that, when we talk about the profit position of a company across the table, the company usually claims we are treading on rather sacred ground and that it is really none of our business.

Mr. BOULANGER (*Interpretation*): In the United States there are 30,000 industries which have a profit-sharing plan. They find a good advantage in it, and there are also several industries doing the same in Canada.

Mr. BURT: That is right.

Mr. VILLENEUVE: I believe we were told by one of the manufacturing company heads the other day that wages since 1947 had increased by 99.3 per cent, but productivity had only increased from 23.3 per cent to 23.4 per cent. Do you agree with that?

Mr. COBURN: We have not been able to get accurate figures from the employers on their productivity increases, and we would very much like to have figures we could rely on. Unfortunately we find ourselves in the position where we cannot simply accept statements that manufacturers give unless they will back them up with data from which they were derived; and as soon as you ask them, they clam up.

Mr. VILLENEUVE: I think the statement made was a factual statement, and from the arguments I heard here I would judge you people do not agree with that, but I want to hear your answer: do you agree with that as being factual or not?

Mr. BURT: We would say no, because we have no way of proving or disproving this.

Mr. VILLENEUVE: So you say it is not factual?

Mr. BURT: We give you figures that come from unions but I do not think the committee could be expected to accept them unless we could back them up with some kind of information we have not got now. So we would give you a qualified no on that one.

Mr. VILLENEUVE: It is pretty hard for us to arrive at a decision if we get that from one source and a contradiction from another. Certainly it will have a bearing on the cost of machinery.

Mr. BURT: If the employer in question who gave you those figures is prepared to submit to us a copy of the data that went into arriving at those figures and give us a chance to study it, we might give you an answer. If they are right, they are right—the facts are clear.

Mr. BELLINGHAM: Is this for one particular plant or the whole industry?

Mr. VILLENEUVE: The agricultural industry. Productivity had increased 23.3 to 23.4 per cent.

Mr. BELLINGHAM: For how many years?

Mr. VILLENEUVE: 1947 to 1960.

Mr. BELLINGHAM: Twenty witnesses sitting at the back of the room will dispute this.

Dr. FORSEY: 23.3 to 23.4 of what?

Mr. VILLENEUVE: Per cent.

Dr. FORSEY: I do not understand that. It is absolutely incomprehensible.

Mr. VILLENEUVE: Those are the figures, that productivity had gone up that much.

Dr. FORSEY: From where?

Mr. VILLENEUVE: Since 1949.

Dr. FORSEY: I do not understand this at all. I do not know whether my colleagues understand it. You might as well say that it went up from potatoes to oranges, as far as I can see.

Mr. VILLENEUVE: I presume he was trying to convey to the committee that they were not getting the work performed as efficiently as they should in comparison to the wage increases. That is the interpretation I took from it. I am not saying it is right.

Dr. FORSEY: How is he measuring it?

Mr. MUIR (*Lisgar*): In tons.

Dr. FORSEY: That is the figure we got before. As Mr. Coburn pointed out, that is rubbish.

Mr. BURT: They have changed cast iron to malleable iron.

Mr. BELLINGHAM: And aluminum.

Mr. BURT: Surely nobody will believe that.

Mr. HORNER (*Acadia*): Mr. Chairman, thank you for coming back to me. I would like to point out that there have been quite a few references made to the consumer price index. It has never decreased. I am reading from the 1960 Canada year book—and I think it should be placed on record because of the number of references we made to it—that agricultural prices—and I do not think too many people will deny this—reached a high in 1951 when we have had this evidence in the committee already. In fact the index at that time reached a high in mid-1951—it was either 196 or 296—and agricultural prices fell from there to practically a low in 1957. Then the trend was stopped, and has gone up somewhat since then.

Looking at the food index—and this is based on 49 equalling 100—I would like to read these figures. In 1950, 102.6; 1951, 117 even—I am reading from page 985 of the Canada year book—in 1951 it dropped in comparison to agricultural prices; in 1955 it was 112, and in 1956, 113. Then in 1957, 1958, and 1959 the consumer price index of food rose again to a high of 122; it went down in 1959. For 1960 it was up ranging somewhere around 120. This points to the fact that the consumer price index to some extent does follow the agricultural prices. I just wanted to put that on the record so that those persons who thought it did not, will notice this.

Mr. COBURN: May I answer that?

Mr. HORNER (*Acadia*): I just presented those figures.

Mr. COBURN: I wanted to point out that between January 1951 and August 1956 the index of farm prices of agricultural products which for that

period 1935 to 1939 is one hundred fell from 234.6 to 200.5. In the same period food components fell from 19 to 15.9. We are moving in opposite directions.

Mr. HORNER (*Acadia*): What index are you reading from?

Mr. COBURN: The D.B.S. index. The index of farm prices of agricultural products from 1934 to 1939 equals 100. That does not affect the question of whether it rose or fell.

Mr. HORNER (*Acadia*): That is precisely what I said—it fell in 1951 from 296 to the relatively low figure in 1957 of 234.

Mr. COBURN: In that period food prices were rising.

Mr. HORNER (*Acadia*): The annual consumer price from the index of the Canada year book—the food index, and I am not saying the consumer index, I am talking about the food index—the food index in 1951 was 117 based on 1949 equals 100. In 1955 it reached a low of 112; in 1956 it went to 113—not too high an increase. It came up again a little faster than the farm agricultural prices, but it still varied to some extent with them. You will agree at least with the figures I presented, and I do not know where our figures differ.

I would like to ask you a question. On page 6, you determine that if any cost increase can be attributed to labour, it would be 16.7 cents out of 87.4. Am I right? This figures out to 19 per cent of the total increase in those years. 11.8 per cent out of 84 is attributed to increase in salaries. This figures to 12½ per cent. Roughly speaking, those two components together make up—I know you do not want to take them together, but we farmers look at them together—above 31½ per cent of the increase in machinery costs. This is reading from your own statistics.

Mr. COBURN: I agree with the facts, but I would like to emphasize again that you are perfectly at liberty to take wages and salaries together and say that this makes it up, but then do not say that it is all the fault of those trade unions, which is the chorus we hear.

Mr. HORNER (*Acadia*): I am not trying to run down labour unions; all I am doing is reading your own figures.

Mr. COBURN: Salary figures include everyone, up to the president of the company.

Mr. HORNER (*Acadia*): I am on record in the House of Commons as speaking about some salaries to some presidents and what should be done to them. I want to point out that this is what can be contributed to that part of increase in wages and salaries.

Mr. BURT: You are dealing now with price increase; you forget that there is also the increase in productivity, so that you get a unit cost.

Mr. HORNER (*Acadia*): I understand some members of the machine companies who were before us said that their salaried people have unions to represent them. Does the C.L.C. represent any salaried persons?

Mr. BURT: Some; not in this industry. I will qualify that. I think there is a small proportion represented here in our council by office workers, but they exclude supervisors and executive management, of course; it is simply salaried workers in the office. I believe in Hamilton, International Harvester also have office workers included.

Mr. HORNER (*Acadia*): So salaries are represented to some extent, but a very small proportion? In any case, I think you will agree that wages make up for about 19 per cent in the increase and salaries 12½ per cent, but you have no idea as to what part of the material increases can be attributed to labour?

Dr. FORSEY: It is an insoluble problem.

Mr. HORNER (*Acadia*): Yes, but still we have to make some assumption—but perhaps we will leave this to the committee. I just want to know whether you agreed with your own figures, and apparently you do.

I have another question, but I will pass it for the present.

The CHAIRMAN: Gentlemen, is it your pleasure to meet again tonight? These men would like to know. Should we finish by 6 o'clock?

Mr. HORNER (*Acadia*): I have about five more questions.

Mr. KORCHINSKI: I have a few and then we can stop.

Mr. BELLINGHAM: Some of the gentlemen will have to know at least an hour ahead because they have planes to catch.

The CHAIRMAN: What is the agreement of the committee?

An hon. MEMBER: We should finish by 6 o'clock.

The CHAIRMAN: We will try to finish by 6 o'clock.

Mr. SLOGAN: Mr. Chairman, in this discussion I think we have all got a lot off our chests, and it has been very useful, but I think it is fair to say that we have not treated you any better or any worse than people who have presented briefs from other segments of the industry. What I have noticed is that in each submission there is always an attempt to show that the witness is not the culprit; there is always someone else to blame. I think what we are here for is for the common good. We are all trying to do what we can to see if we can alleviate this cost-price squeeze experience in agriculture. We, in the government—and there is always the implication that the government can solve all the problems in each case—have done a great deal for agriculture, and there is no doubt that there is more we can do. We are prepared to do that. Unless we can work cooperatively, I think some day we are going to wake up and find there is no market for the farmer and there is also no market for labour. We all have to pool together and pull up our socks.

One thing which is probably not in the brief but on which I would like to comment is, what do you feel labour can do to alleviate this cost-price squeeze on the farmer? Just one example is the fact that production has been declining, imports are increasing, exports are decreasing. I think this is a very serious problem and it should be very serious for labour unions in particular. Have you any liaison with the manufacturing industry whereby you are trying to do anything you can in the way of encouraging industry to capture larger segments of the export market? Have you approached industry or has industry approached you in that respect? Are you trying to cooperate? It seems to me I have detected the attitude that we have more, we want or we need more and we will get more. Have you actively got together and are you trying to work for the common good in this regard? We all recognize the threat we are facing in world markets in every field, and this will be one of them. Are you looking far enough ahead and trying to do something about it?

Mr. BURT: I can subscribe to what you say in respect to the world market. We are very anxious to do what we can to see that Canada does capture world markets if at all possible. But again I have to reiterate that we propose through management and government to establish a liaison committee so we can sit down and solve these problems. We did have two or three meetings a number of years ago. Management representatives have made it plain that they were here for that meeting only, and any proposal of a permanent committee would be rejected. The government called us together. Present at the meeting were representatives of the farm organizations, the president of the Canadian federation of agriculture and the secretary of the Ontario federation—I believe I remember correctly—and also representatives from our council, many of whom are sitting here today. The government had the deputy minister of Agriculture and I think the minister of Labour at that time. It was not under the

present government. We constantly proposed from the congress that these things be done, and we are prepared to propose it now. That is the first step in trying to meet the kind of problems that you raised.

Mr. SLOGAN: Have any of your union leaders in the farm implement industry approached farm organizations and manufacturers to try to get together? We have heard a lot of talk about there being more room for standardization, for limitation of models, and various things such as that. It seems to me that these are areas where you could discuss this without the government. I do not think the government should try to force you people together. There should be a cooperative attitude on the part of various segments of the industry primarily affected. I am wondering whether such overtures have been made. As you go away from this committee and you see some of the problems we are facing perhaps more clearly, are those leaders in the farm implement industry prepared to go out and initiate these talks? Do not always leave it up to the next guy; take some initiative yourself.

Mr. BURT: We have taken initiative not once but on a number of occasions both to the government and the employer. As far as farm organizations are concerned, as I previously stated here, we had them present with us, representatives from all of them, and they sat in during the time we were busy with these briefs. One of the reasons they are not represented here is that they have decided to present their own brief rather than be associated with this brief, but they did sit in and they made some really good recommendations. We are prepared to renew that and take the initiative in this direction, but we do not get support from the management representatives.

The other thing of course is that government could act as an instrument for getting us together, even if they wanted to decide that maybe after the thing was going we could work on our own. It seems to us that we still need some help from the Department of Agriculture because they have the figure available and they have the information that could be very useful in that kind of committee.

Mr. SLOGAN: When this committee closes down and you are going to have the benefit in the minutes of pretty well all points of view, would the unions be prepared to invite farm organizations and representatives of management to sit down together and sift over some of the recommendations and try to do more than that, try to implement them in the industry in which we are primarily investing?

Mr. BURT: We would be prepared.

Mr. FORBES: Could I ask a supplementary question? Do you invite the farm organization to sit in with you and discuss the subject, asking for increases in rates of wages?

Mr. BURT: No.

Mr. FORBES: You have never done that? You are asking them now, when you want to prepare the brief?

Mr. BURT: No, we had them associated with our council for years.

Mr. BELLINGHAM: They went with us to present the brief to the government.

Mr. NASSERDEN: I have a supplementary question. Is there any particular thing that you could recommend along that line that might affect the price of farm machinery or lower it or increase efficiency of the plants?

Mr. BURT: I have no answer to that at the moment.

Mr. NASSERDEN: If you say the cost of farm machinery is too high today, you think there must be some way to lower it. You must have some idea in your mind.

Mr. BURT: We make some rather broad inferences here in our memorandum as to the ability of the employer to lower his price even within the present structure.

Mr. SLOGAN: What are you prepared to do? We hear from everybody what the other fellow should do; what are you prepared to do?

Mr. BURT: What we would suggest is in two fields: first of all we increase our productivity, and secondly we lower our wages. Those are the only two fields in which we operate. We are not prepared to say that until we talk to the employer.

Mr. WEBB: Along this line, take as an example the motor for a roller. Take the instance of a plain grain roller. If you put a one horsepower moisture-proof, dustproof motor on it at our Canadian prices it is about \$202. We can get a 1½ horsepower English motor—a very fine motor—for \$125. We have some \$80 odd difference on a \$125 object. When you go out to the farmer to sell this, how many farmers are going to buy for \$80 odd? They are going to take the stronger motor. I think that is one of the questions that is coming up constantly in the committee. What is the difference in these things?

Mr. BURT: That is a point that will have to be discussed in a kind of tripartite set-up, as was proposed here. I do not know where else you could do it. The employer is not here right now. We are here, and it is pretty hard to make any kind of commitment in answer to this question.

Mr. WEBB: This has nothing to do with it, but just yesterday I looked at the quotation of a Canadian—it has nothing to do with the problem of farm machinery, but this man was in the fishing industry and up to this date he paid \$66,000 for a 365 horsepower diesel engine. He has been quoted by Sweden on an engine for \$25,700. There is a great difference and not everyone can question the craftsmanship of a Sweden engine.

Mr. BURT: There is also a very high standard of living in Sweden.

Mr. WEBB: Yet there is that difference.

Mr. PETERS: I have been interested in the discussions that went on and I think it is a good thing that these questions have been asked. I would like to ask some questions along a different line. We have continuously heard from the farmers, and questions have been asked of manufacturers in relation to some of the things, and labour is always responsible for the cost of machinery. One of them is this business of planned obsolescence.

Is there any assistance which your organization can give us in this field of what the farmer often considers, or which an economist sometimes refers to, as planned obsolescence? Is this a factor, in your opinion, in the farm machinery industry? Is there anything we can do about it, if it is.

Mr. BURT: I am just conversing with my colleagues to find out whether or not we have any opinion on that.

Mr. COBURN: This is an area in which management always tells us it is the manufacturer's prerogative. We do not have much information on it. I would think that the people using the machines would be much more conversant with that problem, than the people who merely make what somebody else designs.

Mr. PETERS: Have you any solution to offer the committee in relation to the high cost of replacement parts? So far as the farmer is concerned, replacement parts are much more expensive than the original component parts. There is a considerable outlay in respect of certain types of machines for these parts. The cost seems to be exceedingly high.

Mr. BURT: We always claim, although we cannot produce any figures, that in the implement and automobile industry one of the most lucrative

sections of the industry so far as profit is concerned is parts. We cannot back this up, but it has always been in our mind that it is so.

Mr. PETERS: Is there more labour cost in the replacement part than in the component part?

Mr. BURT: The companies have quite a problem in maintaining their parts for so many years, as you know; and if there are short runs it is far more costly than if there is volume production. If they have to change dies and change tools in order to meet a certain demand, there is no doubt it would be more costly.

Mr. PETERS: I believe two or three of the provinces in Canada have a law concerning replacement parts. If this were in effect across the country would it mean that replacement parts would be produced at the same cost as component parts? In other words when a manufacture sets up a model, if at that time he was compelled to include an estimated ten years supply of component parts, rather than having to set up machinery to produce replacement parts, would this have an effect on the price?

Mr. KIDD: Then he would have to carry a larger inventory.

Mr. COBURN: I imagine the manufacturer would tell us that carrying that kind of an inventory would mean that the replacement parts in the long run would be more expensive than the original. I do not know, however, whether or not that expense justifies the price differential between a component and a replacement part. Certainly we are not privy to the manufacturers' secrets, but I think there is a general impression that this is an extremely profitable branch of the business.

Mr. PETERS: I have heard the charge made that on a \$300 binder made up of component parts, that the replacement parts out of the catalogue would cost \$1200. This would indicate that you could store them for a week or a long time in a barn at some savings.

Mr. HORNER (*Acadia*): You might never use some of them.

Mr. PETERS: I am not suggesting the farmer should store them, but rather that they be stored in a factory or something.

Mr. BURT: They do make extras. They build extra parts as they make the regular component.

Mr. PETERS: If a law were passed making it a mandatory requirement that—they keep a ten year supply, would that, in your opinion, eliminate the high cost of production and therefore reduce the cost to the farmer of these current parts—not obsolete parts, but current parts.

An Hon. MEMBER: How much is a ten year's supply?

Mr. PETERS: The provinces of Saskatchewan and Manitoba do have a law that a certain stock be guaranteed.

Mr. COBURN: We do not have any detailed information on which to say that the high cost of replacement parts is due to the high cost of producing them. It may be due to the fact that at this point the customer has a machine and has to have that part when the machine breaks down. Most companies act on the principle of charging what the traffic will bear.

Mr. PETERS: Why have the U.A.W. not equalized the wage structure between Canada and the United States?

Mr. BURT: I guess probably because they knew they could get away with it and that the differential was so great that it would be almost impossible to close the gap immediately. Actually during the war period when we were frozen the gap between our wages increased. At one time Ford paid the same in Windsor as in Detroit when he put the twenty-five cents an hour into effect. Now, however, there is a forty-five per cent differential. It is the same in this

industry. We do not see the need for it, but we have been unable to convince the employer to see our way. At every negotiation there generally is one clause which we try to write in and that is to cut the differential between Canada and the United States.

Mr. PETERS: The matter was raised about the taxes of a company being increased because of their extending their holdings. In your negotiations and your understanding of their financial set-up, are these extensions of holdings—large capital gains that they use to renew buildings and build new buildings—a recapitalization by the shareholders or do they come out of the farmers' money paid for farm machinery? In other words, is this considered to be a capital expenditure or just a current expenditure paid out of profits?

Mr. COBURN: It is considered as capital expenditure, but you would have to examine the financial statements of each company separately in order to be able to give a complete answer.

Mr. PETERS: I am curious to know.

Mr. COBURN: The general practice in industry today is that they make two profits, one to pay the shareholders, the other to be put aside as a reserve which they use for capital expansion.

Mr. HORNER (*Acadia*): Is that wrong?

Mr. COBURN: I think, myself, it is economically wrong. I think it is responsible for a lot of the trouble we are in.

Mr. HORNER (*Acadia*): Do you say that theory should not hold for the western Canadian wheat pools?

Mr. COBURN: I am not familiar with wheat pools.

Mr. HORNER (*Acadia*): I am saying it does hold true for them, but are you saying that if it is wrong for industry it is wrong for them, too?

Mr. COBURN: Inasmuch as wheat pools are co-operative enterprises, they are an entirely different proposition.

Mr. NASSERDEN: Do you think industry is not entitled to earn to sustain itself?

Mr. COBURN: But this is not talking about sustaining itself. That is carried out by depreciation allowances, which never appear in the profit figures at all. What industries get now is a depreciation allowance to replace what they have in the way of buildings and plant. This is an additional profit for expansion.

Mr. NASSERDEN: But is not that one of the signs of our times? The farmers and everybody else need more capital today.

Mr. COBURN: Yes, but if corporations would only satisfy themselves with a rate of profit which would enable them to pay a reasonable dividend, and then go into the money market for the money they need for expansion, in the same way as the farmer has to do, or the man in the city who wants to buy a house, they would be able to reduce prices substantially, and the purchasing power of the people of this country would be considerably greater. I think the end of that would be more profits.

Mr. NASSERDEN: But they would have to pay interest on the money they borrowed.

Dr. FORSEY: You get a distortion of investment in certain things because they bypass the capital market completely.

Mr. PETERS: I ask this question because it seems to me it has a great bearing on the question raised by Mr. Boulanger in regard to profit-sharing. If a company were going into capital expansion out of current revenue, then

obviously this would be out of the workers' pockets, and eventually would be at the expense of the farmers who are going to buy the machines? It seems to me this has a bearing on the idea raised by Mr. Boulanger.

Mr. BOULANGER: Under profit-sharing arrangements there is a reserve made, and the expansion comes from the reserve.

Mr. KORCHINSKI: I do not know where this country would be if a company was not entitled to make a profit.

Mr. WEBB: When these figures were submitted by International, the increase was on identically the same buildings. It was not on expansion at all. It was on the buildings which had been there, and the whole increase was put on them.

Mr. BELLINGHAM: You mean 280 per cent?

Mr. WEBB: Yes.

Mr. BELLINGHAM: I am a resident of the city of Hamilton, and I am sure the taxes never went up that high.

Mr. WEBB: That was their statement.

Mr. BELLINGHAM: We do not know they figured that out.

The VICE-CHAIRMAN (*Mr. Smallwood*): You made a statement this afternoon that they made a big investment, and it does not stand up now.

Mr. MANDZIUK: What is your opinion, Mr. Bellingham? When a company expands, you contend that expansion should mean an increase in the labour force?

Mr. BELLINGHAM: No.

Mr. MANDZIUK: What was the sense of the expansion of the company you referred to earlier? I am just asking that for the sake of information.

Mr. BELLINGHAM: More efficient operation, for one thing, and some of the buildings they put up made for more efficient operation.

The VICE-CHAIRMAN (*Mr. Smallwood*): And there are fewer employees?

Mr. BELLINGHAM: Yes, there are fewer employees.

Mr. HORNER (*Acadia*): The suggestion was made that companies never go to the money market and borrow money, but I have Massey-Ferguson's figures here, and they show their long-term debt is \$93 million, while their capital retained earnings are only \$200 million. This suggests their long-term debt is relatively half of their capital retained earnings. Therefore, they must be going to the money market.

Mr. PETERS: Was that the money they borrowed to set up the finance company?

Dr. FORSEY: They get a lot of their capital out of their retained earnings, and they by-pass the capital market to a considerable degree.

Mr. HORNER (*Acadia*): To a considerable degree?

Dr. FORSEY: Yes.

Mr. HORNER (*Acadia*): But here it shows their long-term debt is \$93 million and their capital and retained earnings are only \$200 million. Their long-term debt is almost half of that, and all I am saying is that must have gone to the money market for quite a good—

Dr. FORSEY: Contribution.

Mr. COBURN: This is why I have just said you have to look at the books of each company to get an intelligent estimate of what they have. Some companies have gone to the capital market, and others have not gone to it at all.

Mr. KORCHINSKI: My question has to do with the tables in the brief, and I want something clarified. On page 3 you submit some figures, such as for wages, 29.1 per cent in 1947. I believe these are D.B.S. figures?

Mr. COBURN: They are taken from D.B.S. figures, yes.

Mr. KORCHINSKI: So, for example, the hourly wage rate earnings would be based on D.B.S. figures also?

Mr. COBURN: The hourly rate is collected separately by D.B.S. You could not calculate hourly rates from these figures.

Mr. KORCHINSKI: How do you collect wages?

Mr. HORNER (*Acadia*): The lump figure is given.

Mr. COBURN: If I may explain, the D.B.S. once a year issues a statistical report on the agricultural implement industry, in which they give, for example, the total amount paid out in wages, in salaries, costs of materials, and the other figures here. But the figures you get in your blue book as to average hourly earnings are collected quite separately, on the basis of monthly figures received from the plants. They do not necessarily cover the same plants. They are probably fairly closely comparable, but they are not just exactly the same.

Mr. KORCHINSKI: That is the first point I wanted to make. I am now going to use International figures. For example, they started in 1949, but I am going to use 1952 as a base. In that year the figure was \$1.98 for the average hourly earnings.

Mr. COBURN: In 1952, \$1.98?

Mr. KORCHINSKI: Yet, and according to the D.B.S., the figure was \$1.60. Also, the D.B.S. figure for 1958 is \$1.92, and yet their figure is \$2.51.

Mr. BELLINGHAM: You said \$2.51?

Mr. KORCHINSKI: That is right. These are the figures. There is nothing wrong with these figures, but I am going to suggest that the figures in your brief do not include fringe benefits.

Mr. COBURN: When they give figures for total wages, I am quite sure they would include the fringe benefits in their wage costs, and I would be reasonably certain they are in the figures we have here—the annual figures.

Mr. KORCHINSKI: I would say the International figures are not the same as those you use, because you are using D.B.S. figures.

Mr. COBURN: But the D.B.S. figures we used are not the ones you have in that blue book. They come from a different source and are calculated in a different way.

Mr. KORCHINSKI: It is the hourly average wage earnings for the agricultural implement industry. If it is the D.B.S. report, then it is the same figure?

Mr. BURT: Not necessarily?

Dr. FORSEY: What you have in table 1 are the figures from the annual reports. The lists in table 2 on page 4, where you have hourly average earnings at (5), are the D.B.S. review of man-hours and hourly earnings, and are shown as 170.2 in 1952 and 203.2 in 1958, and they are based on the blue book you have in front of you.

Mr. KORCHINSKI: If that is the case, I just want to point out one other thing. One of the witnesses before this committee mentioned that fringe benefits cost his company about 30 per cent, and that compares with the D.B.S. figures, if you look at the chart.

Mr. HORNER (*Acadia*): That is 30 per cent of what?

Mr. KORCHINSKI: Of the wages—30 per cent of the wages—that is the average hourly rate, so that if you add this 30 per cent to the average rate

on page 5 of the brief I believe you will get the actual true figures. Instead of the D.B.S. figures for a price increase between 1947 and 1958, it would be actually about 39 per cent, rather than the total of 30 per cent.

Mr. COBURN: This is quite incorrect, because we are not using the same figures in the blue book in making these calculations. Our wage figures are taken from the companies' figures of wage costs and, although the D.B.S. does not say so specifically, I am quite certain that those wage costs represent the total wage costs, which include the fringe benefits.

Mr. KORCHINSKI: That is right, and that is exactly what I said. We want to know how this was arrived at. A previous witness told us: "We have taken the total wages, fringe benefits and everything we have paid these people, and have divided it by the number of hours they worked in each year." These benefits, I think, are not included in the calculations which you have made.

Mr. COBURN: Our calculations are made from the D.B.S. figures. They are taken from another D.B.S. publication, and not that one there at all.

Mr. BURT: And they are included in those figures; we do not want to table them twice.

Mr. FORBES: Why do we not all use the one book?

Mr. KORCHINSKI: If it is the hourly average earnings for workers in industry, I am sure it is the same, no matter what book they come from.

Mr. COBURN: I am sure the wage costs include the fringe benefits.

Mr. KORCHINSKI: Do you not think there are certain contributions which a company makes which might be included in non-specified costs? I am thinking of medical contributions, unemployment insurance, and such things.

Mr. COBURN: That all comes under the heading of wage costs. That would not come in under unspecified costs. The standard method is to put the costs attributed to labour as labour costs.

Mr. HALES: I just want to make one or two short observations, and then ask two or three specific questions which I want answered with a "yes" or "no". My first observation is that I feel we have all got quite a bit out of this today, but I am sorry the brief did not use the same years so that we could compare it with the other briefs we have had before us. For instance, some of them started in 1949 and went through to 1960, while this brief today starts in 1949 and only goes as far as 1958. I am also sorry that labour, or at least the inventory figures, have been used for 1952 and 1958, but not for 1947, and thereby mislead. However, that is the way the brief was presented, and we have had to work with what we have before us, but I am sorry it was not in the form I just mentioned.

My first question is this: would the witness agree that wages generally have gone up in the last ten years?

Mr. BURT: Sure.

Mr. HALES: Secondly, would you agree with the statement which is to be found in the report of our proceedings, No. 5, on page 352, which is from a D.B.S. review of man-hours and hourly earnings? That statement sets forth the average hourly earnings in all manufacturing as \$1.72, in durable goods as \$1.87, in iron and steel products as \$2.01, in transportation equipment as \$1.99 and in agricultural implements as \$2.02.

Mr. COBURN: The D.B.S. figures are good in so far as what they are prepared to give us.

Mr. HALES: That being the case, they show us the agricultural implement people are making 30 cents an hour more than the average in all manufacturing. That is a fact?

Mr. COBURN: Drawing that assumption and those comparisons can be very misleading, because the average wage in an industry is the average of a large number of different classes of workers. You have some highly skilled workers and some completely unskilled workers, and the proportion of skilled workers in each industry may vary considerably, so that you may have two industries in which men doing the same work are paid the same wages, and yet the average wage in one industry is higher than in the other, because it has more highly paid workers.

Mr. HALES: That being the case, do you agree those employed in the agricultural implement business are getting 30 cents an hour more than the average of the others?

Mr. COBURN: That does not necessarily mean that any worker in the agricultural implement industry is getting 30 cents an hour more than he would be getting if he were doing the same job in another industry.

Mr. HALES: But according to the rates supplied to the D.B.S., you are higher than people in other industries.

Dr. FORSEY: Look at coal and petroleum products, and at primary iron and steel.

Mr. HALES: Iron and steel shows an average of \$2.01 an hour.

Dr. FORSEY: What is primary iron and steel?

Mr. HALES: The figures are not broken down into that.

Dr. FORSEY: You have quoted the figure for the agricultural implement industry, but I submit that the average for the primary steel, and the coal and petroleum products industries is much higher. You also have not got the figures for smelting and refining of non-ferrous metals. There are a variety of things where the average is higher than in the agricultural implement industry.

Mr. HALES: Let that be as it may, but does the witness agree that wages must automatically reflect in the cost of the product being manufactured?

Mr. BURT: Not necessarily.

Mr. HALES: Then you do not agree that wages are reflected in the cost of what you are making?

Mr. BURT: Not necessarily In the cost?

Mr. HALES: Yes. I shall finish with this. Do you agree labour must assume its fair share of the cost of the product that is being manufactured?

Mr. BURT: Its fair share—yes.

Mr. HORNER (*Acadia*): I have a statement here which is similar to one we often see in labour publications, to the effect that labour is left with no alternative but to press for wage increases until a proper balance is established between wages, prices and profits. Now, this committee has heard quite a bit about wages, we are studying prices, and we have also heard a little bit about profits. Could you give the committee some idea of what you think proper profits should be, in this line of attaining a proper balance between wages, prices and profits? This is the thing we are trying to establish? I know the farmers' point of view, and they are asking when is it going to end? Apparently this continual spiralling will go on until the "proper balance" is established.

Mr. COBURN: I would say the proper balance between profits, wages and prices is one when there is enough money going into the pockets of the people of the country to purchase the goods industry is able to produce, so that you do not have a lot of people unemployed who are not adding to the national wealth of the country.

Mr. HORNER (*Acadia*): That is true, but if the farmers have purchased all the machinery they want, you just cannot go on making machinery and expect them to continue to buy it. The Canadian public can only buy so much of what is produced. We have to sell the rest of it on the world market, and you cannot control the conditions, particularly those outside this country.

Mr. COBURN: That is true or not, but I think that it is a mistake to over-emphasize the problem of conditions outside of this country because our industry relies to a very limited extent on export trade. They certainly can be self-sufficient, if they want to, with the exception of a few products which they have to import, and yet they have exactly the same products, that is the purchasing power to buy what industry is capable of producing.

Mr. HORNER (*Acadia*): Could you give the committee some idea as to what would be a fair profit return on investment?

Mr. COBURN: I would not be prepared to set a figure.

Mr. HORNER (*Acadia*): In answer to a question put by Mr. Nasserden this afternoon you said there is some room for lowering prices, and you said that you made some broad inferences in your brief. Perhaps they were not broad enough, perhaps Mr. Nasserden and I never got them. Could you tell us what you were hinting at particularly?

Mr. BURT: I think the brief is pretty well self-explanatory in respect to the distribution of the sales dollar. We think costs to the consumer are too high and these companies could afford to take a little less.

Mr. HORNER (*Acadia*): In other words, you think the companies today are making too much profit?

Mr. BURT: I think so.

Mr. HORNER (*Acadia*): In this particular industry?

Mr. BURT: In industry in general.

Mr. HORNER (*Acadia*): In other words, 3 per cent of all sales which Massey-Ferguson claims they made you feel is too high a profit?

Mr. BURT: We are not talking about it in that relation. We are thinking of what they invested.

Mr. HORNER (*Acadia*): What do you think Massey-Ferguson made—a return of investment of about 10 per cent before income tax and 6 per cent after income tax? You think that is still too high in your interpretation of profits?

Mr. BURT: I have no thinking on the matter in that regard. I would imagine the employer has always decided on what he wants to make. We think that particularly in companies that administer prices, they do it on the basis of profit they want to make rather than on the other factors that go into cost.

Mr. HORNER (*Acadia*): Do you not think the farmers are price-wise at all? Do you not think they do any shopping to seek out the lower priced tractor?

Mr. BURT: They probably do take two things under consideration—the best built one and the lowest price one—the best built one for the lowest price.

Mr. HORNER (*Acadia*): So that if one company increased their prices—I am going to refer to two particular companies, not using them as examples—Massey-Ferguson is a big company, Cockshutt is a little company. Their combines are a lot alike—they might not admit that—but a lot of the farmers, particularly in western Canada, would accept that statement. If Massey-Ferguson priced their combine high, for example, do you not think there would be a tendency for a number of farmers, if they get the same service from the dealer, to revert to Cockshutt?

Mr. COBURN: If Cockshutt would bring the prices to the same level.

Mr. HORNER (*Acadia*): Even if Cockshutt are having a hard time staying in industry?

Mr. COBURN: This simply gives them an opportunity to get a larger unit profit.

Mr. HORNER (*Acadia*): They are not trying to catch any more of the market?

Mr. COBURN: I do not think so.

Mr. HORNER (*Acadia*): From reading their brief, they are having a hard time staying in business. You say they are not trying to capture any more of the market?

Mr. COBURN: I doubt that very much. If they tried to compete pricewise with Massey-Ferguson or International Harvester, they would soon find the prices would come down, so they do not try.

Mr. HORNER (*Acadia*): Do you think the prices would come down?

Mr. COBURN: If they tried to compete; but they do not try.

Mr. HORNER (*Acadia*): To go back to profits, in the C.C.I.L. brief to be presented to the committee—they have not yet presented it and I do not know whether they are going to or not—they suggested that while profits were high in the early 1950's, they could return big dividends to the purchaser, as much as \$600 or \$700 on a combine—it was as high as \$1,400 in the early 1950's on a combine. But in the last three years, in the late 1950's they have not been able to return dividends; in fact they were pressed back to the wall because there has not been enough spread for them to return to the producer. Actually there was no advantage for the producer to buy their products. This is taking it from their own brief. With that in mind, do you still think Massey-Ferguson and some of the big machine companies have made big profits in the late 1950's? I am not speaking of the early 1950's, they were high then, but I am talking about the late 1950's.

Mr. COBURN: I would say the companies have put themselves in a position where their profits are probably not as high as they would like them to be because they skimmed all the cream off the market in the early 1950's when prices were very high. I saw some Massey-Ferguson figures, which I think were presented to this committee, which indicated that in 1950 the return on their investment before taxes was about 67 per cent and their profits represented about 20 per cent of the sales. The result was that they milked the farmer dry in that period when he had extra cash, and they are paying for the consequences now.

Mr. HORNER (*Acadia*): How do you mean that?

Mr. COBURN: The market was very largely dried up. Farmers do not have the money to buy equipment.

Mr. HORNER (*Acadia*): In 1959 John Deere said they sold more than ever before, and that they had higher profits than any year before 1951.

Mr. COBURN: John Deere is an exception.

Mr. HORNER (*Acadia*): Actually purchase of farm machinery is continuously rising. Farmers' purchases of new machinery in Canada in 1959 and 1960 were \$212 million each year. This, compared to say, 1950, to use that as an example; farmers purchases in Canada of new implements was \$118 million for that year. Farmers were purchasing at nearly the level they did in 1950.

Mr. COBURN: Not nearly the level. \$212 million would not begin to buy the same machinery. We are certainly aware of the fact that farmers are buying far less because far fewer members of our industry are working.

I was asked a question earlier, and I did not have the exact figures as to what the decline in employment of our industry had been. The last figure I had is for 1960, at which time we had 6,916 wage earners in the plants. That was in November 1960, and it is less than half the average employment in 1952 when it was 14,513.

Mr. HORNER (*Acadia*): To go back to 1946 or 1945, how does it compare?

Mr. COBURN: I do not have it earlier than 1947. You have got to remember that 1945 and 1946 were years of war industry. In 1947 it was 13,688; in 1948, 16,051, substantially more than double what the present employment is now. We are very keenly and painfully aware of the fact that farmers are not buying nearly as much in physical volume of farm implements as they used to do.

Mr. HORNER (*Acadia*): But purchases of farmers have remained relatively level?

Mr. COBURN: In dollar terms.

Mr. HORNER (*Acadia*): Since 1954?

Mr. BURT: Is not a great deal of volume in tractors?

Mr. HORNER (*Acadia*): For tractors there is a table presented in units, thousands of units, presented by the implement dealers to this committee. It suggests that in 1954 the purchases of tractors in Canada have remained relatively level.

Mr. COBURN: What were they before 1954?

Mr. HORNER (*Acadia*): They were high in 1949, and this is in units. They reached a high of pretty nearly 60,000 units in 1949, and the remaining level at about 30,000. This is reading the graph rather roughly. Before 1949, from 1945 to 1949, they climbed all the way from 20,000 to 60,000. It has to level out, do you not think so? This particular brief showed a comparison between the decline in horses and the increase in tractors. The years between 1945 and 1950 saw the sharp increase of mechanization in farms. You will agree with this. But this increase could not continue at that level because farmers will eventually be reasonably well stocked up because a tractor's life is up to 40 years. We had evidence before the committee.

Mr. COBURN: If you are suggesting farmers in Canada today are in a financial position to buy all the equipment they need, I think you are very much mistaken.

Mr. HORNER (*Acadia*): I am not suggesting that; I am suggesting that farmers could not continue to buy implements at the rate they did during the late 1940's and early 1950's. I am suggesting it was bound to level out sooner or later.

I should like to put more emphasis on this question. To come back to the profit angle, you agreed that 10 per cent and 6 per cent before and after income tax was still too high? Do you agree with that? Could you give us some idea what the returns on the dividends should be on investment to the shareholders? You suggested something about dividends earlier on.

Mr. COBURN: No, we cannot give a flat figure because a great deal depends on the stability of industry itself. In other words, in a very risky industry you would naturally expect, if people were going to invest in it, a larger return than in a very stable and secure industry.

Mr. HORNER (*Acadia*): Would you say this is a risky or stable industry?

Mr. COBURN: It certainly has been much less stable in the last few years than it was earlier.

Mr. HORNER (*Acadia*): John Deere said it was a risky business.

Mr. COBURN: Let me say this: I have never yet seen a statement by any manufacturer in any industry about his business, that is not a very risky industry. In the automobile industry, General Motors can average a 25 per cent yearly return on their investment after taxes, and they still claim it is a risky industry.

Mr. HORNER (*Acadia*): They might well be justified in doing that. The greater the risk in the good years the greater the profits. For instance, J. I. Case lost 18 cents on the dollar this year. To look at that year, you could say that for J. I. Case it was a risk. The greater the risk the greater the profits in the good years.

Mr. COBURN: This does not necessarily work out that way.

Mr. HORNER (*Acadia*): It tends to. Farmers' business is a risky business, therefore in good years when wheat farmers receive good crops—30 to 40 bushels an acre—their profits may be higher, but when they receive a bad crop or are hailed out, they have no profits whatsoever—they are in the hole.

Mr. CLERMONT: Mr. Chairman, if the farm implement industry was nationalized, do you think the farmers would pay less for farm implements?

Mr. COBURN: I have never seen a suggestion that the farm industry should be nationalized.

Mr. CLERMONT: It was said so by one group that presented a brief here not long ago.

Mr. BURT: We cannot answer this question.

Mr. FORBES: Mr. Chairman, I would like to get an expression of opinion from the witnesses on the proportion of costs in the manufacture of a windrower. These were supplied by International Harvester Company. They say materials, steel, wood, cotton duck, pipe and tubing, tires, bearings, chain, propeller and power shafts, machine tool repair parts, cutting tools, abrasives, cutting oils, miscellaneous supplies. Now, the proportion of these material costs varies from 48 per cent in 1954 to 50 per cent in 1960. In the labour costs they include salaries (foremen, purchasing, industrial relations, planning, accounting, material control, et cetera). They also include fringe benefits, welfare plans, vacation plans, et cetera. They also include receiving and shipping labour. These labour costs vary from 41.44 per cent in 1954 through a range of percentages back to 41.44 per cent in 1960. In your opinion, is that a fair proportion of costs in connection with manufacturing that windrower?

Mr. COBURN: It is quite impossible to say unless you have a great deal more information about that particular manufacturing operation. You cannot pick a manufacturing operation out of a hat and ask us to say whether a certain division of costs is fair or not. We just do not know.

Mr. FORBES: I imagined you fellows were trying to present your case to the machine companies and would have some basis of cost figured out to show them what it would cost.

Mr. COBURN: No, they never give us that information on which we could calculate.

Mr. BELLINGHAM: We cannot get that information from the machine companies, and never knew until we came to Ottawa the price of a windrower, until we saw it in the Harvester brief. It is the first time we knew what they charged for it. I cannot tell whether this is an objective case, as I have had no opportunity. I do not know whether we are making it cheaper this year than last year, but at least the men working on it are getting the same wages.

Mr. FORBES: You fellows work on these things every day. Do you not try to find out what it costs your factory to produce them?

Mr. BELLINGHAM: We know what it costs to make it, but we do not know what the total would be. We do not know what the foreman's wages are, and we do not know what the other charges are. How would we know?

Mr. FORBES: Is this your feeling, that it is well proportioned—half labour and half material?

Mr. BELLINGHAM: I cannot say.

Mr. FORBES: You would not venture a guess?

Mr. BELLINGHAM: No.

Mr. SOUTHAM: I have been listening with a great deal of interest all evening, and have been waiting to ask a question. I would like to follow up the line of argument that Mr. Slogan introduced. Our prima facie problem is to find out the cause of the increase in the cost of farm machinery, and it is our responsibility as a government to see that all the people living here have an equal opportunity. I am thinking of labour, of industry, of the farmer and the businessman. I have no quarrel with collective bargaining as part of our democratic rights, as one of the things you yourselves as a labour group are primarily interested in. However, in making this point, I assume that with collective bargaining would also go economic responsibility. I was interested to notice in one of your briefs if you had some suggestions as to what you think we could do to help solve the problem, which is basically our problem here. There has been skating around this point for quite a while this afternoon, but I would like to get down to that basic question. What basic contribution, in your opinion, could you make, in the way of suggestions to this committee to help solve this problem?

Mr. BURT: We have already said we are prepared to sit down with the representatives of the management and if the government would assist us, and the representatives of labour, and talk all these problems over to see what we can contribute. One reason why our contribution in some of these spheres of economics is less than it should be is because we are not taken into the confidence of the people with whom we are dealing. I understand that one representative before your committee said that the information you wanted was confidential. We get that thrown at us, too. We do not set the prices of farm machinery. Our contribution would be in relation only to conversations and discussions which we would have, in some kind of tripartite group, to see what kind of contribution we could make. Our proposal several years ago about taking a look at our wage demands, if the companies would reduce their prices, was made almost in the nature of buying a pig in a poke. We felt that they might reduce prices, we wanted to sit down and discuss these things but we did not get this opportunity.

Let me make this clear, also. The workers in these heavy industries particularly when they are facing every day efficiency experts and all kinds of quality-control inspection and so on, find it is not as easy a job as some people suppose it is. I have not seen too many of our agricultural implement workers retiring on big fat retirement pensions, nor are they generally in a position to retire at all. Generally when they reach the age of 65 they barely have a modest home paid for, and then they have to exist on their retirement pension of whatever has been negotiated between the company and the union. Some of them are in a far worse position than the farmer, particularly those who are out of work for a certain length of time. Therefore, as far as your question is concerned, it would be determined wholly at conferences, as to what we would be able to arrange between management and labour, probably with government assistance, in order to find a solution to these problems. That cannot be done in a day.

Mr. SOUTHAM: I am very glad to hear you making that statement because on casting my mind back to 1958, when this government took over—and I am

not casting reflections on any government as it is any government's responsibility to look after these things and to look after the people under its jurisdiction—in 1958 our Prime Minister, at the invitation of the Labour Congress addressed a meeting in Winnipeg. I believe it was on May 17, and he talked seriously about these problems. He pointed out that the responsibility was on the shoulders of industry and he gave a forthright talk. I was very interested because it faces up to this problem. I am sorry Mr. Knowles is not here. At that time he made a statement from the very same platform and said the problem which he saw, as being responsible for his group, that it was the demand for higher wages, shorter hours, and more fringe benefits. I think that is in your statement here today, and I think it is a very hopeful sign.

Going back to the old country, where there is a highly efficient and organized labour force, the most highly organized in the world, we find that, particularly after the last war, when English economy was down and out, and Britain was nearly brought to its knees, labour and industry cooperated, the people tightened their belts, even more than we did in Canada, with the result that in two years they had balanced their budget, and they were enjoying one of the best standards of living in the world. I think we could learn a lesson from those, and that that is the crux of the whole situation. We must get around the conference table and work with industry and get a proper approach to this whole problem.

Mr. BOULANGER: You should say that in the House of Commons.

Mr. HORNER (*Acadia*): There is one further question. You implied that the farm implement industry is not a risky business. You said the machine companies think it is, but you are not so sure it is. We have had evidence before this committee that C.C.I.L. perhaps would benefit a great deal if it added a manufacturing arm to its distribution service. Has the C.C.I.L. ever considered going into the farm implement manufacturing business, setting up a manufacturing shop and maybe adopting a distribution system? You might share some of the high profits you were talking about—10 per cent and 6 per cent—and pay it out in the cooperative business with the workers.

Mr. BELLINGHAM: Ten per cent and 6 per cent? Do you mean that of companies which are spending billions on buildings all over the place? Do not say that they are not a stable industry.

Mr. HORNER (*Acadia*): I do not know, except from their figures. John Deere said it was risky. You say it is stable. You say the profits are high. Here we have a distributing firm in Saskatchewan, Manitoba and Alberta which is having difficulty because it has not got a manufacturing arm. All I am asking you is whether you have ever thought of going into cooperative manufacturing, taking a group of implement men and putting all your unions together to do this?

Mr. BELLINGHAM: I will suggest that to the company tomorrow morning.

Mr. HORNER (*Acadia*): Not to the company.

Mr. BELLINGHAM: I thought you were asking us to take them over.

Mr. KORCHINSKI: Not to take them over, but for you to start on your own.

Mr. HORNER (*Acadia*): I do not want anyone to take over my farm, but there is nothing to stop me from going in and buying my neighbour out. That is what I am saying to you people. The profits are big, the industry is stable, there is a distribution firm which needs a manufacturing arm, a cooperative manufacturing arm would be all the better if it could be done, as they would do much better as a union. Has the C.C.I.L. ever thought of that?

Mr. BURT: The structure of the national congress is not at all suitable even to the contemplation of that.

Mr. HORNER (*Acadia*): I am just suggesting cooperative manufacturing.

Mr. BURT: In the first place, it would take a tremendous amount of capital and we would have to put ourselves in a competitive position. May I say that one of the few businesses affiliated to the congress, which are richer than the congress—

Mr. KORCHINSKI: How rich is the congress?

Mr. BURT: The congress is not very wealthy, it is living hand to mouth—I happen to know that. We are to some extent in the newspaper business, which is a very highly competitive one, as you know. We have an awful time making a success of some of our newspaper enterprises, because of the high competition financed by people who have a lot of money and have access to a number of things to which we do not have access. I know that some of the unions in the United States run businesses. Some of them have had rather sad experiences in that regard. Others have had very bad experiences. If there has been any thought by the congress of adopting such a suggestion it would be very quickly dissipated by the members.

Mr. HORNER (*Acadia*): It was just a suggestion. It need not necessarily be done by the congress itself. I might just enlighten the witness here that the C.C.I.L. was first founded and supported by the provincial governments in the prairie provinces, and particularly by one big organization, the Saskatchewan wheat pool and perhaps the Alberta wheat pool. These are the people who should put up the money. Then they could distribute the profits.

Mr. MANDZIUK: And the farmers themselves?

Mr. HORNER (*Acadia*): A lot of the farmers right in here had shares in this business and tried to promote this distribution business. It only seems logical to me that when we have the two groups trying to get together, they could go out and form a manufacturing business with some guidance from C.C.I.L., but not perhaps as a direct arm. Perhaps some people would give them guidance and a little bit of capital, and perhaps C.C.I.L. would give some finance. The Saskatchewan government said that any time the C.C.I.L. want to go into the manufacturing business, they would get a loan of money.

Mr. KORCHINSKI: They are broke.

Mr. HORNER (*Acadia*): The Saskatchewan government is not. Have you really considered going into the cooperative manufacturing agency in order to support your C.C.I.L. cooperative distribution system now firmly established in western Canada?

Mr. COBURN: Mr. Horner, would you think it would be a sound practice for say U.A.W., which has organized most of the workers in the industry, to establish a plant of its own to build agricultural implements, knowing perfectly well that the more successful that enterprise was, the more U.A.W. workers in other groups would find their jobs in danger?

Mr. HORNER (*Acadia*): You have said a lot were out of work right now. You have said there was unemployment. What I was thinking of was that you should pick up the slack.

Mr. COBURN: Not necessarily. What I am afraid is that it would mean the building of these things and then hand them over to John Deere.

Mr. HORNER (*Acadia*): You would also have such a volume of business that you could include them in your business.

The VICE-CHAIRMAN: We would like to thank you for appearing here with your brief today, and we would assure you that we were no more rough with you than with any other organization which has come here as a witness

at our inquiry into the farm machine prices. Probably you had one of the easiest times, as you are getting away at six o'clock and you are the first group that has done so.

Mr. BURT: Thank you very much, Mr. Chairman. I may say on behalf of our council that we appreciate the attention which has been given to our brief and the manner in which you have received it. I appreciate also that you have been less tough than with other delegations—although, confidentially, I may say that we thought you were pretty tough.

The VICE-CHAIRMAN (*Mr. Smallwood*): The committee will meet next Friday morning at 9.30 to hear the brief from Macdonald College.

13

HOUSE OF COMMONS

Fourth Session—Twenty-fourth Parliament

1960-61

STANDING COMMITTEE

ON

Agriculture and Colonization

Chairman: JAMES A. McBAIN, Esq.

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 13

Respecting
PRICES OF FARM MACHINERY

FRIDAY, JUNE 2, 1961

WITNESS:

Professor David L. MacFarlane, B.S.A., M.Sc., Ph.D., Professor of Agricultural Economics, Macdonald College, McGill University.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1961

STANDING COMMITTEE
ON
AGRICULTURE and COLONIZATION

Chairman: James A. McBain, Esq.,

Vice-Chairmen: Paul Lahaye, Esq., and C. S. Smallwood, Esq.,
and Messrs.

Argue	Hales	Pascoe
Badanai	Hardie	Peters
Belzile	Henderson	Phillips
Boulanger	Hicks	Racine
Brassard (<i>Lapointe</i>)	Horner (<i>Acadia</i>)	Rapp
Campbell (<i>Lambton-Kent</i>)	Horner (<i>Jasper-Edson</i>)	Regnier
Clancy	Howe	Ricard
Clermont	Kindt	Rogers
Cooper	Knowles	Rompere
Danforth	Korchinski	Slogan
Doucett	Latour	Southam
Drouin	Leduc	Stefanson
Dubois	McIntosh	Tardif
Dupuis	Mandziuk	Thomas
Fane	Michaud	Thompson
Forbes	Milligan	Tucker
Forgie	Montgomery	Villeneuve
Godin	Muir (<i>Lisgar</i>)	Webb—60.
Gundlock	Nasserden	
	Noble	

(Quorum 15)

Clyde Lyons,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

FRIDAY, June 2, 1961
(26)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Campbell (*Lambton-Kent*), Clermont, Cooper, Danforth, Doucett, Fane, Forbes, Hales, Henderson, Horner (*Acadia*), Horner (*Jasper-Edson*), Knowles, Korchinski, Lahaye, McBain, McIntosh, Mandziuk, Milligan, Muir (*Lisgar*), Noble, Pascoe, Peters, Rapp, Rompre, Smallwood, Southam, Thomas, Thompson, Tucker, and Webb—(30).

In attendance: Dr. D. L. MacFarlane, B.S.A., M.Sc., Ph.D., Professor of Agricultural Economics, Macdonald College, McGill University.

The Chairman instructed the Clerk to read a copy of a proposed letter on future plans of the Committee.

Agreed,—to discuss these plans on Friday, June 9th.

Agreed,—to take the Macdonald College brief as read and print it as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix "A"*).

The Chairman introduced Dr. MacFarlane.

The Chairman withdrew and Mr. Clifford Smallwood, Vice-Chairman, took the Chair.

Dr. MacFarlane read a condensed version of the Macdonald College brief.

The Committee questioned Dr. MacFarlane on the brief.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING (27)

The Committee reconvened at 2.45 p.m. The Vice-Chairman, Mr. Clifford Smallwood, presided.

Members present: Messrs. Badanai, Clancy, Clermont, Danforth, Fane, Forbes, Hales, Hicks, Horner (*Acadia*), Horner (*Jasper-Edson*), Knowles, Korchinski, Lahaye, McIntosh, Mandziuk, Milligan, Muir (*Lisgar*), Nasserden, Noble, Pascoe, Peters, Rapp, Smallwood, Southam, Thomas, Tucker, Ville-neuve, and Webb—(28).

In attendance: same as at morning sitting.

Agreed,—That letter enclosing figures from International Harvester Company on Foundry Production be made an appendix to today's Minutes of Proceedings and Evidence. (*see Appendix "B"*).

The questioning of Dr. MacFarlane on the Macdonald College brief was concluded.

The Vice-Chairman thanked Dr. MacFarlane for his appearance.

At 4.45 p.m. the Committee adjourned until Monday, June 5th, at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

FRIDAY, June 2, 1961.

The CHAIRMAN: Gentlemen, I see a quorum this morning. Before we start our morning's procedure, I believe Mr. Southam has a correction to make.

Mr. SOUTHAM: Mr. Chairman, on the record of the minutes of proceedings of our committee, No. 10, for Monday, May 22, when we heard the witness from John Deere, on page 817, when I was referring to the duty being paid on combine cabs, I was quoted as stating that it was \$21 or \$22. It should be \$121 or \$122. I think Mr. Horner can corroborate my statement.

Mr. HORNER (*Acadia*): Yes, the duty is \$121 or \$122.

The CHAIRMAN: Gentlemen, as you probably are aware, we have only one other scheduled meeting besides the one this morning, that is next Monday when we have Cockshutt Farm Equipment Limited with us.

I will ask Mr. Lyons to read a copy of the letter you will all be receiving.

The CLERK OF THE COMMITTEE:

The standing committee on agriculture and colonization will conclude its hearings on Monday, June 5.

Your subcommittee on agenda and procedure has decided to hold a meeting, in camera, on Friday, June 9 to start on the preparation of a report.

I would appreciate it if you would put your views in writing, as to what you would like the report to contain and send your letters to the Clerk of the Committee or bring them to the camera meeting.

Yours sincerely,

James A. McBain,
Chairman.

Mr. HORNER (*Acadia*): Mr. Chairman, before we start tabulating any report, I was under the impression that Massey-Ferguson was coming back with some facts and figures. I do not care whether the subcommittee decided something or not, as to whether or not the committee has finished with its hearings. This should be left up to the committee itself, and certainly I was under the impression that Massey-Ferguson was to come back. I would like to know, for instance, what replies were received from the company. I suggested the Clerk write to a company in Alberta, and the rest of the committee agreed it was a good suggestion. We were to have letters from other machine companies—or write to them anyway—Oliver Company, J. I. Case, Minneapolis Moline, all of whom have a distribution centre in Canada. In 1948 J. I. Case was the third largest manufacturing concern in the North American continent, according to this brief we are having presented to us this morning. So I think this idea of winding up the committee on June 9 should certainly receive greater study than that.

The CHAIRMAN: Mr. Horner, the subcommittee considered the letter to which you are referring concerning the machine company out in Alberta.

Mr. HORNER (*Acadia*): Noble Cultivators.

The CHAIRMAN: Mr. Lyons informs me that he has received no reply from them as yet.

Mr. HORNER (*Acadia*): This points towards the fact that we should not wind up the committee investigations as yet.

The CHAIRMAN: It is not necessary to wind up this committee. We will have at least one or two meetings in camera to discuss further things. If the committee decides at that time they want to bring someone else here, that is up to the committee.

Mr. HORNER (*Acadia*): I am strongly opposed to this suggestion.

The CHAIRMAN: I wanted to pass to this committee what the subcommittee had decided yesterday.

Mr. HORNER (*Acadia*): Is this final? Is this when the committee is to wind up, June 5? Are we led to believe Massey-Ferguson is not to be called back to present figures? We have had other figures from all the machine companies and it is unfair that Massey-Ferguson should not come back and produce figures.

The CHAIRMAN: The committee can deal with that in camera.

Mr. HORNER (*Acadia*): Do you not think it would be better to line it up so that on June 9 we could have another machine company come before us? We would be wasting time in dealing with it in camera on June 9. It should be settled right now.

Mr. DANFORTH: Can we not have another meeting on June 5 and then an in-camera meeting on June 9 with the committee as a whole to determine future policy rather than argue it out and take the time of the witness this morning? I am in favour of some of Mr. Horner's suggestions. I think the committee as a whole should be taken into the confidence of the steering committee and have an opportunity to make suggestions as to procedure.

The CHAIRMAN: Mr. Danforth, if a room is available, I will have no objection to holding any meeting at any time.

Mr. MILLIGAN: Can we not meet on Tuesdays and Wednesdays instead of holding our meetings on Mondays and Fridays?

The CHAIRMAN: There are five committees meeting on Tuesday mornings.

Mr. MILLIGAN: I do not think we should be sacrificing our time, because many of our members are not on other committees.

The CHAIRMAN: These days have been assigned out to other committees and we are trying not to interfere with other committees, so that they can have a quorum. That is why our committee selected Mondays and Fridays when there are not so many other meetings going on.

Mr. DANFORTH: May we not have two meetings on Friday to take this up? I would like to see further discussion on this.

Mr. HORNER (*Acadia*): I would say one more thing on the whole subject. The thought of having Massey-Ferguson return was more or less tabled. It was not decided not to have them nor was it decided to have them, but the whole thing was tabled, and I was certainly under the impression that the committee would decide whether they wanted to hear them again. The committee, not the steering committee, should decide when they want to hear other companies, and I certainly think we should have a meeting to decide this. Perhaps now is not the time. Maybe if this brief winds up relatively early this afternoon we could decide it then, but the committee should decide it rather than the steering committee.

Mr. SMALLWOOD: We were going to suggest that you bring your suggestions in.

Mr. HORNER (*Acadia*): You are wasting the whole of Friday.

Mr. SMALLWOOD: The subcommittee decided to hold a meeting on June 9 in camera, to decide what we would do with the rest of the machinery com-

panies, and with the report. We are not closing off the hearings. You will have plenty of opportunity at that meeting to put forward your views.

Mr. SOUTHAM: I would like to go on with the suggestion. I am quite in agreement with this possibility of the steering committee looking over and suggesting what should be brought into the report, not to wind this up as the final hearing.

Mr. SMALLWOOD: We are not.

The CHAIRMAN: It is not the intention to wrap it up entirely.

We have with us today David L. MacFarlane, professor of economics at Macdonald college, province of Quebec. Dr. MacFarlane is also economic consultant to the Quebec Agricultural Marketing Board and presently is serving as a member of the Quebec dairy industry inquiry committee. He is chairman of an Ontario commission inquiring into the area of possible conflict between cooperatives and marketing boards. Recently he was a member of an Ontario dairy industry inquiry committee. The report of that committee has been received with great interest and may lead to substantial changes in dairy marketing in Ontario.

Professor MacFarlane also has served as consultant to the present royal commission on transportation and is now working on an assignment from the royal commission on government organization. I am very pleased to present Dr. MacFarlane.

Before Dr. MacFarlane proceeds, is it agreeable we accept the brief as read?

Mr. HORNER (*Acadia*): Before he proceeds, I wonder if he would state on whose behalf he is presenting the brief—whether on his own behalf as professor of economics at Macdonald College, McGill University or not. Would he give us some information as to whose beliefs are in this brief, and on whose behalf he is presenting it?

Dr. DAVID L. MACFARLANE (*Professor of Economics, Macdonald College, McGill University*): Mr. Chairman and gentlemen, I am very pleased to make a statement on this matter. This is an absolutely independent brief. It expresses my own views and only my own views. It also expresses the views of the Macdonald College inasmuch as the views of any such institution are the views of its professors. The university belongs to the professors, and they are authorized to speak on behalf of the university.

Mr. McINTOSH: I intend to ask Dr. MacFarlane a question, also. It will take a couple of minutes. It is: What is his definition of agricultural implements? Should I ask that now, or when he has finished his brief?

The CHAIRMAN: Dr. MacFarlane has an oral statement which he would like to make. I hope every member has a copy. In so far as he can deal with your question, Mr. McIntosh, he will do so after he has presented this condensation of his brief.

Dr. MACFARLANE: Thank you, Mr. Chairman. I am very pleased to have the brief itself accepted as read. I will read now this short statement. I do not think I shall introduce any comments during the reading of it, although I suppose that, with the chairman's permission, you may interrupt even as I read this. The statement is as follows:

Economists working on the problems of the Canadian farm industry are most sympathetic with and understanding of the situation confronted by the farmer and by your committee. They are very much aware that farm prices are lower today than they were ten to twelve years ago, that the farmers' costs have risen by about one-third since 1949, and that the price of farm machinery has increased by 60 per cent over the same period. This has brought declining real incomes to farm families over a period when workers in non-

agricultural industry were realizing an improvement of nearly thirty per cent in their real incomes. Economists have observed with admiration, if not always with agreement, the efforts of governments to aid the farm industry. They are very much aware that governments frustrated in direct attacks on the farm problem turn to the consideration of indirect means of aiding agriculture. This committee inquiry represents one such means. It is very proper that the people of Canada through their government be vigilant with respect to insuring that industries, particularly those composed of a small number of firms, operate in the public interest.

The crux of the matter rests in determining precisely what is the public interest, and when, where and how the public interest is transgressed. An Ottawa lawyer, Mr. D. Gordon Blair, states in an article which has attracted widespread attention and approval:

"Under modern conditions, it is plain that competition does not depend for its existence upon a large number of small competing units. The big three in the automobile industry may compete much more vigorously than any number of retail druggists in a community. It is recognized that competition can be expressed in many forms besides simple price rivalry among suppliers of identical commodities. There is the competition of substitutes, the competition of innovation, and the competition of service, all of which have given strength and vigour to our economy, and in all of which price competition finds in part its modern expression."

It should be noted in examining the economics of industrial organization under modern conditions that "the law... does not make mere size of a corporation, however impressive, or the existence of unexerted power on its part, an offense when unaccompanied by unlawful conduct in the exercise of power." Committee members will be aware that this principle, even though enunciated by the United States supreme court, is held applicable in Canada. This position denies the mere size of a corporation, or the small numbers of corporations in a single industry, as bearing on undesirable monopoly power.

If your committee would find the agricultural machinery companies operating contrary to the public interest, it would have to find evidence of conspiracy or collusion between the manufacturers in this field. No evidence has been presented in support of such a view. On the contrary, the courts in the United States, and independent economic analyses such as those presented in the outstanding works by Whitney and by Stocking and Watkins suggest vigorous competition. If one were to examine in detail the history of competition in the production and marketing of tractors which is reported briefly in the statement which I have filed with the committee, one could have no doubt about the existence of active competition, both in terms of product and of price. I come to the conclusion that over a forty year period some five or six tractor manufacturers have virtually staked their corporate existence on the success of originality in innovation and aggressiveness in pricing and marketing. This fact is perhaps best illustrated by the experience of the Ford Motor Company in capturing 80 per cent of the United States tractor market in 1923 and then, because it could not keep up with its competitors, finding it necessary to drop out of the market entirely by 1928. This illustration is not unique. Each of four or five companies has encountered the experience gaining a large share of the tractor market by engineering innovation and by pricing policy and then finding that they could not hold their market position in the face of product and pricing policies of their rivals. I feel that it can be stated that the North American agricultural machinery industry has today changed in no respect in the exercise of the strong competitive elements of innovation and of pricing which existed in the 1920's, 1930's, and 1940's. Without having access to industry secrets, I am certain that each tractor producer is bending

every possible effort in the direction of coming up with a new "break-through" in the sense that the first Fordson, the Farmall, putting tractors on rubber, or the use of the hydraulic principle as developed by Harry Ferguson represented very profitable "break-throughs".

I feel the committee would hear the words of Professor Schumpeter of Harvard University when he stated:

"As soon as we go into details and inquire into the individual items in which progress was most conspicuous, the trail leads not to the doors of those firms that work under conditions of comparatively free competition but precisely to the doors of the large concerns—which, as in the case of agricultural machinery, also account for much of the progress in the competitive sector—and a shocking suspicion dawns upon us that big business may have had more to do with creating that standard of life than with keeping it down."

I bow to the great wisdom of Professor Schumpeter.

I have great regard for Professor Schumpeter and, may I add he was no apologist for big business.

The subject under inquiry by your committee opens up two very broad subject matter areas on which it would perhaps be prudent to carry further inquiry. The first of these is to determine what processes are really occurring during a long inflationary period. The second is to determine how prices are set in industries dominated by a relatively small number of producing units.

On the first of these questions, a committee of the United States Congress conducted a very exhaustive inquiry in recent years. While many witnesses were heard most of the committee activity was devoted to receiving and discussing research reports by leading economists. And while these reports aided committee members in clarifying their thinking on the nature of the inflationary process, there was no agreement for instance on the relative importance of wage-push as against demand-pull forces in the post-war inflationary process.

The second issue is that dealing with the pricing policies or pricing decisions of individual firms in an industry dominated by a relatively small number of firms. Of one thing we can be sure—that individual companies will price their products so as to make the highest level of sustained profits over a period of years. Their decisions with respect to pricing an individual item are apparently guided on the one hand by fairly crude internal cost guides or estimates of an arbitrary type, and on the other hand by the assessment of the market and of the present and prospective pricing policies of rival firms. The latter can only be guessed at. Economists certainly agree that in the pricing of any product, whether it be produced by an industry with thousands of firms or an industry with half a dozen firms, demand is of far greater importance than cost. Given the pattern of incomes at the present time or a projected future pattern of incomes of the users of a product, and you have a good guide to the trend of prices in any industry, including agriculture. This does not mean that in an industry with a small number of suppliers, that these firms can set their prices where they please. They have to take account of competing firms seeking to improve their profit position by appropriate pricing policies. The history of the agricultural machinery industry shows that even in periods when patterns of price leadership may have been apparent, there was vigorous competition both in price and in product innovation. This has been reflected by the erratic fluctuations in the proportion of the market for any implement or for all implements which was secured by each of the full-line companies. It has also been reflected very strongly in the wide sweeps in the proportion of the total agricultural machinery market which went to the many hundreds of smaller producers who did not market a full line. Studies of the industry concluded that the increase in the number

of full-line companies from three to eight has represented an increase in competition. Thus we have evidence of the process of merger increasing rather than decreasing competition in the market.

Dr. Whitby summarizes the profit position of the American farm machinery industry by showing that in the 1947-52 period return on net worth of the large companies was 13.2 per cent, slightly less than the average for more than 1,500 manufacturing concerns; in the 1953-55 period returns on investment in the industry were only slightly more than half those of the preceding period, while for all 1,500 manufacturing companies there was only a very slight decline. Canadian income tax data show the industry made moderate profits in the late 1940's, high profits in the period of the sellers market of the early 1950's. But by 1956 profits almost disappeared and have been at moderate levels since.

Actually the prices of agricultural machinery fall into much the same pattern as those of comparable manufactured items in an inflationary economy and of important factors purchased by the industry for the production of machinery. Thus while farm machinery prices rose by 101 per cent from 1947 to 1960 and by 61 per cent since 1949, rolling mill products rose by 90 per cent since 1947 and 57 per cent since 1949, pig iron prices rose by 88 per cent in the first period and by 40 per cent in the second period. Average hourly earnings in the agricultural machinery industry rose by 121 per cent from 1947 to 1960 and by 81 per cent since 1949. The price of rubber as reported by the Dominion Bureau of Statistics rose by 73 per cent since 1947 and by 74 per cent since 1949.

Since data respecting the capitalization of the agricultural machinery industry are not available it is impossible to analyze satisfactorily productivity of labour or of capital. However, while making this statement it may not be out of place to emphasize the fact that partial productivity measures (those for a single production factor) involve logical inconsistencies. This point is made by Professor Alfred Rees of the University of Chicago in the following terms:

It is now generally well realized that output per man-hour does not necessarily reflect the contribution of production workers to changes in efficiency. It can rise because production workers work harder or are more skilled. However, it can also rise because more capital or more non-production workers are used per production worker. It can rise because of the improved quality of purchased materials or because of an increase in the ratio of purchased materials to final output. And, most likely of all, it can rise because of technological change.

Depending on its source, a gain in output per man-hour may or may not imply that real wages should rise. In general we expect that in the sectors of the economy where output per man-hour rises least rapidly, wages will outstrip this measure of productivity, so that they will stay roughly in line with wages for workers of equal skill elsewhere in the economy. Where output per man-hour rises most rapidly, we expect wages to lag behind it. Some of the productivity gain will go into lower relative prices, and thus be shared with the consumers of the product.

While logical difficulties as well as a lack of the required data present difficulties in constructing particularly useful partial productivity measures, venturesome economists still do it—and the measures may serve some useful purpose. Thus Messrs. Fullerton and Hampstead in a research report for the royal commission on Canada's economic prospects concluded that Canadian productivity per man hour in agricultural machinery on a value added basis in 1953 was some 32 per cent below that of workers in the United States industry. Thus the low Canadian productivity may roughly have offset the fact that hourly earnings in the Canadian industry were lower. (In 1959 the differential in favour of American workers was 27 per cent.) While it has long been recognized that Canadian based plants operate in the face of very

severe transportation disadvantages in serving the prairie provinces and the midwestern area of the United States, Canadian plants appear to have no advantage in terms of labour costs, despite the lower level of wages prevailing in this country. These facts would tend to discourage any optimistic conclusion with respect to the prospects for success of Canadian based companies in increasing their penetration of the American market. And yet this is the great challenge which faces our industry.

Since 1944, when the last Canadian tariffs on farm machinery were removed, the industry has moved in the direction of integration of production facilities to serve the entire North American market. This has not only been advantageous to Canada in the sense of securing exports for Canadian products, but has given farmers access to agricultural machinery on the same terms as apply to American farmers, and has yielded a further advantage in terms of allowing the economies of large scale production of particular machines. A further outgrowth of the removal of the tariff in 1944 was an increase in competition within the industry so far as that bore on serving Canadian farmers.

The statement that I filed with the committee considers the economic position of the Canadian farm industry over the post-war period and the role which agricultural machinery is playing in that industry. It is a common place, of course, that agricultural machinery has been a major factor in the rapid increases in output per man in agriculture—so much so that it has definitely contributed to the surplus of threatened surplus situation in the farm industry. Agriculture has been unable to make sufficient adjustment to its increasing productivity to maintain labour and capital returns anywhere near those which apply in other industries. This situation arises first with the very large number of individual units in agriculture, the importance of self-employed labour, and because of the biological processes employed in farm production, processes which often require years to run their course. Thus it is not possible to render output subject to fluctuations in demand.

Perhaps more important or more significant in accounting for the difficulty in adjusting output to demand in agriculture is the fact of the very slow growth of demand itself. As Professor Schultz has stated, if the demand for farm products grew only half as fast as the demand for all groups, the problem of making an adjustment of output to demand would present no difficulty.

Operating within such a context returns to labour in the farm industry have not only been very low over most of the post-war period but have declined in real terms over the past ten to twelve years. In contrast with the situation prevailing in agriculture most other Canadian industries and the workers in them have been favoured during the inflationary post-war period. Thus the real returns to workers in the non-agricultural industries have increased nearly 30 per cent since 1949.

In the face of such circumstances, and because agriculture was caught up in a burst of productivity (this in the large part associated with the use of agricultural machinery), the farm industry has made very substantial adjustments in factors of production employed and in aggregate output. Since 1941 there has been a decline of 18 per cent in the numbers of farms while total capital has increased by 167 per cent. Machinery investment increased by 267 per cent while investment in livestock increased by 220 per cent and that in land and buildings by 137 per cent. On a per farm basis the increases in capital were substantially greater due to the reduction in numbers of farms. Ontario and the prairie provinces led Canadian regions in adjustment in capital structure followed by British Columbia, Quebec and the maritimes.

While the foregoing very substantial adjustments in capital have been made over a 20 year period, the notable upward trend in real investment in agricultural machinery per acre of improved land and per worker halted about 1954 and has declined slightly since that date. This is apparently identified

with the increased impact of the cost-price squeeze over the years since 1954. A resumption of upward trends in these measures will await an improvement in farm income. Nonetheless the general tenor of farm management reports is that on most commercial farms net returns would be improved by the use of additional machinery.

Economic projections of Canadian agriculture suggest that further painful adjustments in numbers of farms and in numbers of workers in agriculture are required. If these were to proceed at a very rapid rate it would be possible to project a significant improvement in farm incomes over the next decade. However, rapid adjustments for these factors in agriculture requires a buoyant economy. It is further recognized that because of the family nature of the farming business that there are natural barriers or resistances to rapid adjustment. Actually the speed with which adjustments occurred over the past 20 years came as a surprise to most observers. This fact in itself provides some encouragement for the future.

Finally returning to the economics of the agricultural machinery industry, the industry has operated at about one-half of its capacity since 1954. This contrasts with the corresponding United States industry which in recent years has been operating at 80 to 90 per cent of capacity. Judging by these facts one could scarcely conclude that the ideal of a full integration on a continental basis has been achieved. Because of the contribution of a well integrated farm machinery industry to Canadian farmers, it is hoped that the Committee will have something to say with respect to means of strengthening the Canadian sector of the North American industry.

The VICE-CHAIRMAN (*Mr. Smallwood*): Gentlemen, we have heard Dr. MacFarlane's short summary. Before us is a 75-page brief. We are meeting here to look into the cost of farm machinery. This brief is very extensive; it goes away back to the eighteenth century, and looking forward to the jet age. I do not see that it is going to be of much assistance in our present problems, so all I can say is just to throw the meeting open to questions.

Mr. HORNER (*Acadia*): Before the questioning starts, is this brief going to be submitted as an appendix to the proceedings?

The VICE-CHAIRMAN: Certainly.

Mr. HORNER (*Acadia*): So we can ask questions on it.

Mr. McINTOSH: I have been endeavouring to get the government's definition problem is to read a letter I have written to the deputy minister of national revenue, which is concerned with agricultural implements under 438 (f). I revenue, which is concerned with agricultural implements under 438 (f). I will read this. It will possibly give Dr. MacFarlane an outline of what I want. May I have your permission, Mr. Chairman?

The VICE-CHAIRMAN: Fine.

Mr. McINTOSH: I have written to Mr. David Sim, who is deputy minister of national revenue, as follows:

You asked me to put in writing the reasons I challenge your department's ruling that a steel grain, or livestock box used for agricultural purposes should:

- (a) not be classed under 438F, parts of a motor vehicle—but rather
- (b) be classed as an agricultural implement.

Item 438F deals with parts of motor vehicles. I contend that a steel truck, grain or livestock box is not part of what is considered a motor vehicle or the chassis thereof, but rather an article to be mounted or attached thereto. Item 438A states such articles shall be valued separately, and duty assessed under tariff items regularly applicable thereto.

In western Canada, and the same may be said of eastern Canada, automotive dealers very seldom sell a farm truck with steel grain box attached. If the farmer requires a grain box the normal procedure is for the farmer, or dealer, to obtain one from an implement dealer. Grain and livestock truck boxes are usually manufactured by those specialized in manufacturing agricultural implements and not from automotive manufacturers. Most automotive dealers price sheets list chassis only and do not include a price for a grain or livestock box. Therefore, I contend a grain box should not be considered as a part of the truck, but considered under some other heading.

I further contend a steel grain or stock truck box could be included under the heading of agriculture implements for the following reasons. In legal dictionaries, the term implement is defined as a thing of necessary use in any trade. The word necessary is defined as those things to the doing of a thing which are reasonably required.

In Funk and Wagnall's ready reference dictionary, implement is defined—a means or agent for the accomplishment of a purpose. Mr. P. M. Ollivier, chief law clerk of the House of Commons, has given the definition of agricultural implement as follows—anything that is used for agricultural purposes mainly becomes an agricultural implement.

McGoldricks handbook of the Canadian customs tariff and excise duties recognized as an authority or guide by Canadian industry, starting on page 267 has a general heading "agricultural implements" viz: This same heading of implements is carried on for seven pages, listing hundreds of items considered as agricultural implements by legal authorities and industry.

In my opinion a steel grain or livestock box used for agricultural purposes is an agricultural implement. I further suggest, the term agricultural machinery, as it appears in item 409F is superfluous as agricultural machinery is adequately covered by the term agricultural implement.

Nowhere in my search of a definition of the term agricultural implement did I find anything that did not support the authorities. I have quoted, nor did your officials offer any authority to dispute the commonly accepted definition. Surely someone in your department, either yourself as deputy, or the minister, is responsible to give an authoritative definition of the term implement.

I trust you realize my position on this issue, I must give my constituents some authority for the government's interpretation of the term implement, other than an arbitrary statement, to justify the decision you have apparently made in this case.

I would appreciate your personal comments, also the comments of the tariff board on the term agricultural implements.

Now, the answer that I received is very evasive. I think I have not the government's definition of "agricultural implements". I would like the doctor to give his interpretation.

Dr. D. L. MacFARLANE (*Professor of Agricultural Economics, Macdonald College*): Mr. Chairman, I should be glad to make a few comments and remarks on that without, I suspect, being particularly helpful. The definition which most people who are concerned with the economics of this industry use is what is included in the dominion bureau of statistics agricultural implement industry report, and my understanding of that is that it is a very broad definition. I think it may be of some use to the cause which Mr. McIntosh is espousing and with which I am very sympathetic. If you make the distinction between agricultural implements or agricultural machinery on the one hand and equipment on the

other—dairy barn equipment as distinct from agricultural machinery or agricultural implements—I take it that the agricultural machinery industry is concerned with agricultural machinery and equipment used for agricultural purposes on farms. Therefore, I take a very broad definition. I think the Department of National Revenue must be legalistic. They are interpreting a law and I can provide no help on that matter.

Mr. McINTOSH: On page 7 of your brief, Dr. MacFarlane, you say:

Since 1944, when the last Canadian tariffs on farm machinery were removed.

Would you take it that a grain box—and I could name several things not included under this tariff item—anything that is used solely for the purpose of farming, would be farm machinery or farm implements?

Dr. MACFARLANE: I think, if I may say so, Mr. Chairman, that the statement made on page 7 is one of these over-all statements and a little bit loose. We can read in dozens of places that all tariffs on farm machinery were removed in 1944. I agree that this is not 100 per cent true, that some items in my book which are agricultural machinery or equipment are still subject to duty.

Mr. McINTOSH: I would just like to draw it to the attention of the committee that we are looking into the high cost of farm machinery, farm implements or equipment to the farmers, and in this case I have found that for every hundred dollars a farmer pays towards the grain box, \$40 is paid to the government. Maybe we should look into that. In fact, on a \$1,000 grain box—steel grain box as I have described in that letter—almost \$400 is paid to the government on tariffs and sales tax.

Dr. MACFARLANE: I would agree with that, Mr. McIntosh.

Mr. HORNER (*Acadia*): Dr. MacFarlane, you say at the top of page 2 of your main brief:

Governments frustrated by the failure of direct attacks on the farm income problems unavoidably turn to examining the possibility of indirect efforts to improve farm incomes. Thus the House of Commons committee on agriculture and colonization is currently examining the prices of farm machinery.

This implies to me that there is no real cause, in your view, for this inquiry but that because, in your view again, the government is frustrated and maybe some of the members here are frustrated, the government has decided to give them a job to do. Surely, this is the way this paragraph is to be interpreted.

Dr. MACFARLANE: Mr. Horner, if I may say so, this is a general kind of reflection of agrarian history that has prevailed for more than a hundred years. Perhaps I have not chosen well in introducing it, but this is straight agricultural history, and you can pick it up in textbooks on the subject, that in periods when governments are frustrated—and I say I admire this aggressiveness of the government in trying to assist the farm industry—farm incomes have not responded very favourably and we are thrust back onto other measures. I take it that this inquiry was absolutely serious and it was hoped that something would come from it. I would not want to identify myself with the view of the hon. member that this assignment was given to the committee just to give them something to do.

Mr. HORNER (*Acadia*): I am glad I interpreted this paragraph wrongly. It is a long time since I have been to the university and sometimes we farmers like to deal with facts rather than generalities and history. Do you not agree that the price index concerning the numbers of commodities and services used by farmers since 1951 has only gone up 9.5 per cent—and I have the index before me—while the machinery price index which is included in the

over-all goods and services used by farmers has gone up 44.4 per cent? Do you not think this in itself would warrant an investigation as to why one thing has crawled up so much faster than most of the other things farmers buy?

Dr. MACFARLANE: I would agree.

Mr. HORNER (*Acadia*): Another thing I would like to clear up in this particular paragraph. Do you not agree also that farm income and farm prices in the last two or three years saw a small upturn?

Dr. MACFARLANE: I would have to speak to that from the record, and the record is here in my big brief. The record is over the past six years. Income per unpaid family worker in real terms in 1955, \$1,030; 1956, \$1,278; 1957, \$839; 1958, \$1,023; 1959, \$952 and 1960, \$1,175.

Mr. HORNER (*Acadia*): What are those figures you are reading?

Dr. MACFARLANE: On page 57 of the brief those figures are real income or income in terms of 1949 constant dollar per unpaid family worker in agriculture. That is the whole self-employed agricultural labour force.

Mr. HORNER (*Acadia*): When you refer to "real income", are you referring to the net income put out by D.B.S. or the cash income?

Dr. MACFARLANE: Net income as stated at the top of the column, net farm income adjusted so as to give constant purchasing power throughout. In this table the dollar buys the same amount of goods and services purchased by the farm family throughout the years, and therefore it is what we call a measure of real income.

Mr. KORCHINSKI: Have you got any figures for the communist countries? On page 1 you refer to the fact that capitalist economies have not provided "fair shares" to an important capital owing class—the farmer. Have you any figures to compare it with in any other society?

Dr. MACFARLANE: No, I have read figures but I have not got any. I have seen lots of tracts on the economy of the Soviet Union. I am not recommending it. I take farmers to be a most important class of capitalists. In Canada they own \$11 billion worth of farm assets.

Mr. KORCHINSKI: How much do they own in communist countries?

Mr. HORNER (*Acadia*): You are perhaps aware of the index number of farm prices which the D.B.S. put out?

Dr. MACFARLANE: Yes, sir.

Mr. HORNER (*Acadia*): You will more than likely agree that since 1958 this has shown a slight improvement.

Dr. MACFARLANE: Page 57 of my record here, regarding the farm price index, which I have converted to the 1949-equals-100 basis—and your Department of Agriculture economist could check on this—shows no improvement.

Mr. HORNER (*Acadia*): Even looking at your own index, you notice that for 1956, for example, the index was 90 on the 1949 equal to 100 basis. In 1957 it was 92, and in 1958 it was 95. Why you should have the indication "preliminary" in respect of the 1959 figures is beyond me; and I might say it is beyond me why you should have "preliminary" for 1960, also. These figures are all available and why they should not be put in as facts is beyond me. At any rate, it shows a slight improvement from 1956 upwards. I am sure you agree with that?

Dr. MACFARLANE: Yes, I would agree.

Mr. HORNER (*Acadia*): Your first figure was for 1958.

Dr. MACFARLANE: I could not agree with that.

Mr. HORNER (*Acadia*): 1958, sir? Let us look at the 92 and 95.

Dr. MACFARLANE: I am sorry—we will go to the record. Your first question was, has there been some improvement in farm prices since 1958?

Mr. HORNER (*Acadia*): Yes. I meant from 1958—including 1958.

Dr. MACFARLANE: On the question of the word “preliminary”, the prices must necessarily be preliminary until the final Canadian wheat board payments are in. I think the 1959-60 pool and the 1960-61 pool on the Canadian wheat board have not been closed, and you cannot take “preliminary” away from these figures until these pools are closed.

Mr. MUIR (*Lisgar*): They will show an improvement, I think.

Dr. MACFARLANE: They will show an improvement, but I think it will be limited to 1 per cent or $1\frac{1}{2}$ per cent.

Mr. MUIR (*Lisgar*): Relative to 1958?

Dr. MACFARLANE: Yes, this is correct—and I am happy to admit that.

Mr. McINTOSH: I am interested in a paragraph on page 5 of the statement which Dr. MacFarlane has just read. It says:

Dr. Whitney summarizes the profit position of the American farm machinery industry by showing that in the 1947-52 period return on net worth of the large companies was 13.2 per cent,

Further down you refer to “moderate profits” and “high profits”. What do you mean by “net worth”, and was that 13 per cent net or gross?

Dr. MACFARLANE: My understanding is net after taxes and by the term—

Mr. McINTOSH: Do you mean to say they made a net profit of 13.2 per cent?

Dr. MACFARLANE: This is my understanding, based on the net worth or the shareholders' investment in the industry.

Mr. McINTOSH: I think that generally speaking in Canada, of all industry, the net profit of all industry is somewhere around 3 per cent. I forget the name of the blue book which gives it. I think the average is 3 per cent.

Dr. MACFARLANE: I think you would agree, Mr. McIntosh, that that might not be true over the post-war period. After all, people were not investing in corporate securities for a return of 3 per cent over the post-war period. Perhaps in recent years it has fallen—but I do not think it went down to that extent. In fact, dividends in 1960, as I recall, were the highest in history.

Mr. McINTOSH: The point I am trying to get at is the net. I would like to get this clear. I do not think the net profit of any industry has ever, for the last 15 or 20 years, gone into two figures.

Dr. MACFARLANE: I would have to disagree.

Mr. HORNER (*Acadia*): There is a lot of evidence on the record that Massey made 17 per cent in the period 1947 to 1952.

Mr. DANFORTH: Net on total sales. This is a comparison on net worth.

Mr. McINTOSH: Let us get down to the bottom of that paragraph, where you say:

Canadian income tax data show the industry made moderate profits in the late 1940's, high profits in the period of the sellers market of the early 1950's. But by 1956 profits almost disappeared and have been at moderate levels since.

I wonder if you could define your term “moderate profits” percentage-wise to sales, and “high profits” percentage-wise to sales.

Dr. MACFARLANE: Let us start with this last period. The Canadian income tax statistics show profits of something around one-half of one per cent in 1956, as my recollection goes. Shareholders returns since that period have risen,

but have not exceeded 8 per cent—and that to me is moderate. In fact, investors in equity stocks would not invest much money when they got this 5, 6, 7 or 8 per cent that they have received since 1956.

Mr. McINTOSH: We had one witness before us who had capitalized shares of \$15 million, as I understand it, and for one year—I think it was last year—they showed a net payment to the shareholders of \$3½ million, on that \$15 million investment.

Dr. MACFARLANE: This is very possible, because it is one firm; and secondly, because it represents American business, where the industry is having a good deal more prosperity, I judge, than in Canada. I am sure your figures would be on some North American or world basis.

Mr. McINTOSH: If such is the case, would you say that this committee is justified in inquiring into the high cost of machinery? Would you consider that high profit?

Dr. MACFARLANE: I would consider it low in the early post-war period, high in the buyers' market period of the early 1950's, and moderate since 1956.

Mr. HORNER (*Acadia*): This is on Canadian companies only?

Dr. MACFARLANE: Canadian companies only. I went finally to the income tax data and picked this up. This is the Canadian story. The North American story, or the world-wide operations of some of these companies, tells a very different story.

Mr. McINTOSH: In practically all trade there is a laid-down net profit which any industry should be entitled to obtain. What would you say that net profit should be in regard to machinery? Have you any idea?

Dr. MACFARLANE: I do not think, Mr. McIntosh, that I have a particularly useful idea on that. I think that over the post-war years, investors in Canadian equity companies have secured—or the industries have secured—returns net, after taxes, ranging from 8 to 14 per cent—something of that order. If you want to put the farm machine industry alongside it, it would be indicated that there is much greater fluctuation in the returns in the farm machinery industry than in any large group of industries, or any sectors of the Canadian economy like pulp and paper, or industries of that nature.

Mr. McINTOSH: Would you care to give us an average on farm machinery?

Dr. MACFARLANE: May I ask this question—a “proper” average, or the average which has been earned?

Mr. McINTOSH: A moderate average, to use the term you are using.

Dr. MACFARLANE: Since 1956, as I recall, the figures of net return on shareholder equity have been 5, 6, 7 and 8 per cent. This is moderate and is lower than most companies earn on investment.

Mr. DANFORTH: Could you give the committee what you would consider in the post-war period a normal return, that we might use as an index? With your investigation, you must have a picture in your mind. What would you consider in the post-war period an excessive return? What would you consider as a normal return?

Dr. MACFARLANE: I would consider as a normal return something in the order of 8 to 12 per cent, in the post-war period.

Mr. DANFORTH: And in the present time?

Dr. MACFARLANE: Seven to 10 per cent.

Mr. DANFORTH: Thank you.

Mr. MANDZIUK: Mr. Chairman, I believe I voice the feeling of most members of the committee that this brief is probably more academic than briefs we have received here before. I do not see any buck-passing such as we have

seen in other briefs. However, may I refer Dr. MacFarlane to page 2 of his oral statement, where he says:

If your committee would find the agricultural machinery companies operating contrary to the public interest, it would have to find evidence of conspiracy or collusion between the manufacturers in this field.

I would like the professor's opinion as to whether or not he is trying to limit our judgment on implement manufacturers inasmuch as, unless we find collusion and conspiracy, it absolves them of all blame in the high cost of machinery. I see he makes no reference to poor distribution, or certain advantages the implement companies take over their dealers, and so on.

Dr. MacFarlane, you quote American authorities. Is that the only criterion by which to measure the Canadian manufacturer?

Dr. MACFARLANE: No, Mr. Chairman. This is a very good question. I not only quote American authorities, I quote the two outstanding Canadian works, one by Phillips and one by J. D. Woods and Gordon Company, prepared for the royal commission on Canada's economic prospects. The American has been very useful in understanding this industry, however, on its continental basis. With respect to the question you asked—your first one—that I am in effect saying that the farm machinery companies have to be absolved unless you find conspiracy or collusion. I am trying to emphasize here, for the assistance of the committee—

Mr. MANDZIUK: That is what we are looking for, sir.

Dr. MACFARLANE: I am trying to emphasize here that an industry, even with a small number of firms, can be competitive, and I think there has been evidence presented about the competitive character of this industry; and if this competition is operative—and I mean effectively operative—then this is about the most one can expect. I have tried to provide a general economic framework in which to conduct an inquiry. If there are aspects of this industry where the record may not be good—you mentioned distribution—I think it is quite proper that you should examine those aspects, and certainly not absolve the industry in advance.

Within the context of general economics you have to absolve them of wrong-doing unless you find collusion and conspiracy. But you do not necessarily have to absolve them for inefficiency. Competition looks after that it may be that the distribution system is inefficient. I am not saying so. Incidentally, we know little about it, and we do not know much more about it after you have had the dealers before you. Just as much as we require, and find it is useful to have the dominion bureau of statistics report on the agricultural industry, it is also important to have the dominion bureau of statistics work on agricultural implement distribution. They do a census of distribution for many industries and here is one which, because of the interest in it, should be done. That is a recommendation I am making in my report, and I hope it has been helpful.

Mr. MANDZIUK: Am I wrong in getting the impression from this brief that the professor's opinion is that there is active competition both in terms of product and in price? I shall add another matter which the professor can deal with jointly. You say in the second sentence of that paragraph:

No evidence has been presented in support of such a view.

You mean no evidence as to conspiracy and collusion?

Dr. MACFARLANE: That is right.

Mr. MANDZIUK: Have you read the briefs presented to us?

Dr. MACFARLANE: I have read most of them; I think all of them.

Mr. MANDZIUK: And all you were looking for was whether or not there was any evidence of collusion or conspiracy?

Dr. MACFARLANE: Not at all. There are many issues to be dealt with here, some of which are considered briefs which have been presented, which have nothing to do with conspiracy and collusion; and there are many aspects of the industry which may require examination. From my reading of the briefs there has been no demonstration of collusion or conspiracy.

Mr. McINTOSH: Will you define those other aspects?

Dr. MACFARLANE: I take it that those other aspects refer to distribution, the level of labour productivity in the Canadian industry whether or not the statement which was made here by the representative of labour will stand up—you can examine that; and you can examine the integration of the industry after the removal of the tariffs to see whether it has been really advantageous for Canada, as I claim. There are many aspects of this industry which could be examined. You might want to go to the Hamilton and Toronto plants to have a look around, and then go to Chicago, following which you might want to say, "Boys, you should do it differently." There are lots of aspects of this industry that you could properly look into.

Mr. McINTOSH: With a view of cutting down the profits?

Dr. MACFARLANE: With a view of understanding the problems that are under investigation.

Mr. McINTOSH: Would that not conflict with the statement made in your brief where you say that regardless of the 20 per cent lower labour costs in Canada we still cannot compete with the United States?

Dr. MACFARLANE: I think it is very important that this matter be understood. I will say this: that the people who made this study in 1953 for the royal commission on economic prospects are not too confident about their figures. But they were confident enough to publish them. These studies were used for exactly the same period, using the same variables or aggregates in Canada as in the United States, and they came out with very great differentials in productivity.

Mr. McINTOSH: Could you give us some idea where Canadian costs are higher than those of the United States? Our labour costs are 20 per cent lower, so something else must be higher.

Dr. MACFARLANE: Our wages are more than 20 per cent lower, but the output per worker is correspondingly lower, so that Canada—I mean Canadian industry—gets no advantage from paying lower wages.

Mr. MANDZIUK: I am not through. I just have a comment to make on which I would like to hear the witness' comments. We had evidence submitted to us that the number of wage earners has decreased in a certain industry while the number of salaried personnel has increased. We have no access to the figures to show what the salaried employees are earning. Might that not give us some—at least suspicion that the price of farm machinery is just due to the high salaries paid rather than the higher pay to labour?

Dr. MACFARLANE: Mr. Chairman, Mr. Horner indicated that in the dominion bureau of statistics report the earnings of salaried workers—that is in the 1958 report, the last report available—were \$13,205,000. Granted, this figure has increased faster than the earnings of production workers.

Mr. HORNER (*Acadia*): I want to make that clear. I should put on the record that according to the figures from the dominion bureau of statistics from 1947 to 1958, production workers' salaries—the average wage earnings of production workers—increased 113 per cent, while the average wage earnings of the salaried personnel, according to their industry report, increased 119 per cent; that is according to the dominion bureau of statistics.

Mr. HORNER (*Jasper-Edson*): I would like to know if you think that the varied international nature of the farm machinery companies has offset

some of the benefits of low tariffs by their pricing policy? I am particularly interested not so much with respect to the United States but with respect to Great Britain and Canada.

Dr. MACFARLANE: I would like to ask Mr. Horner to restate his question so that I might get on the track.

Mr. HORNER (*Jasper-Edson*): Do you think that the varied international nature of the farm machinery companies has offset some of the benefits of free trade in farm machinery?

Dr. MACFARLANE: I would say, sir, that I have no evidence of this.

Mr. HORNER (*Jasper-Edson*): The price of a particular tractor—I shall use a Massey-Ferguson tractor, type 35, small diesel—the price at which a farmer in Great Britain can buy this tractor is substantially lower than the price at which a farmer in Canada can buy it, even when taking into consideration that there is a differential; in other words, if you should go to England to get one of these tractors and ship it home you would still save money when buying that tractor as compared with buying it from a dealer in Canada. Now, how come? We have free trade with no tariff, yet we are not getting the benefit of the lower production costs as they do in Great Britain because of the international nature of the farm machinery business pricing policy.

Dr. MACFARLANE: I did not know that that statement was made anywhere in the briefs. I take it that Massey-Ferguson submitted this in their brief?

Mr. HORNER (*Jasper-Edson*): Massey-Ferguson did not submit this in their statement, but it is a fact.

Dr. MACFARLANE: Yes. I do not know it to be a fact, although I think there is no barrier to a farmer or a business concern purchasing tractors in the United Kingdom and bringing them over here.

Mr. HORNER (*Jasper-Edson*): No, that is true. The officials of Massey admitted to the committee that people who were starting to do this found that because of certain distribution problems it was not working out too well, according to them, but we do not know that.

Dr. MACFARLANE: This is a good area to inquire into. I confess I do not know the facts. But I would rather bluntly suggest another point, that I would not expect the prices of farm machinery or the prices of any given item to be the same in the two countries, or even to differ only by transportation costs, just because of the nature of the market. These boys are out to get the last dime they can out of the tractor, and if it means selling it at a higher price in one place than another, they will do so.

Mr. HORNER (*Jasper-Edson*): In other words, we are not getting all the benefits of a tariff-free market?

Mr. MANDZIUK: Nor of competition.

Dr. MACFARLANE: I think it is a fair reading, provided the facts in your statement are true, and provided there are no impediments to somebody going and buying this tractor and bringing it over here. International trade is a pretty rough deal, and if there is a dime to be made anywhere, there is somebody out to make it.

Mr. HORNER (*Acadia*): In the first place, to clear up this matter, you have to be a franchised dealer in order to buy this machine from Massey in Great Britain, because they will not sell it to me from the factory. If I want to buy it, I have to buy it through a franchised dealer in Great Britain. I cannot get it at the lowest cost from the factory in Great Britain, or anywhere. They have control over who buys their products in Canada.

Mr. MILLIGAN: Is there not some tariff against machinery coming in from Great Britain?

Dr. MACFARLANE: There is none.

Mr. MILLIGAN: Well, if I buy a steel share for my Ferguson plough, it costs me \$15 to get it from Britain, but it only costs me \$8 to get it in Canada.

Mr. MCINTOSH: It is not an agricultural implement.

The VICE-CHAIRMAN (*Mr. Smallwood*): That is right.

Mr. MUIR (*Lisgar*): Throughout your brief you indicate that labour costs are a considerable factor in the cost of farm machinery, and at page 44 you say:

Increased labour productivity would seem urgently required if the Canadian industry is to maintain and expand its share of the American market for farm machinery.

Do you feel that our unions are destroying Canadian labour productivity by adhering to rigid, outworn union controls which were perhaps necessary in the early struggle of labour, but which are now denying to our Canadian workers one of the basic human freedoms, the right to work?

Dr. MACFARLANE: Over the years it has certainly been necessary for labour to organize, but we now live in what may be called a "labouristic society". I know there are undesirable labour practices, be they in the railways or elsewhere, but I do not think they are any worse in Canada, or as bad as they are in the United States. Therefore you cannot use them to account for the lower productivity of Canadian industry.

Mr. MUIR (*Lisgar*): You would not use labour at all. Are you talking about labour?

Dr. MACFARLANE: I am talking about labour, yes, and referring to the fact that your statement that Canadians may possibly be placed at a disadvantage by labour practices, we are no more at a disadvantage than they are in the United States. I am very sympathetic and have an understanding of the whole struggle that labour has had. I do not want to go on record as opposed to labour or to labour bargaining.

Mr. MUIR (*Lisgar*): May I continue this afternoon?

The VICE-CHAIRMAN (*Mr. Smallwood*): We shall now adjourn until 2.30 in this same room, when Mr. Muir will have the floor.

AFTERNOON SITTING

The VICE-CHAIRMAN (*Mr. Smallwood*): The meeting will now come to order.

Mr. KORCHINSKI: I want to make reference to the proceedings when the Canadian Labour Congress was before the committee, at which time a statement was made which I challenged. I have checked with the dominion bureau of statistics and this is the statement I got from them: it is that this figure in "Agricultural Implements Industry 1952" is the gross earnings of the workers before deductions. Anything paid by the employer as his portion of unemployment insurance and so on, is extra. I was making reference to the \$2.02 average earning per hour per worker, and the fact International Harvester Company apparently was paying about \$2.62, which I thought was about 30 per cent higher than was recorded in the statement wherein reference was made to the dominion bureau of statistics. I was suggesting at that time that the average earnings were higher because of extra fringe benefits. That is all I want to say at this time.

The VICE-CHAIRMAN (*Mr. Smallwood*): Gentlemen, we still do not seem to have a quorum. Oh yes, now I see we have a quorum.

Mr. MUIR (*Lisgar*): Just before we adjourned for lunch I was asking Professor MacFarlane a question with regard to productivity per hour. On page 17 he says:

But the lower wages in Canada are more than offset by lower productivity of workers.

Since the professor has used this statement, which was based on the Hampson and Fullerton submission to the royal commission on Canada's economic prospects, in connection with Canadian secondary manufacturing industry—is that right?

Dr. MACFARLANE: I am sorry that I cannot check that statement at the moment. But you are very likely right, and I shall check and change the transcript.

Mr. MUIR (*Lisgar*): However, in answering this question I felt that Professor MacFarlane had sort of backed away from this statement that Canadian output per man-hour was lower than that of the United States. Unless we can clarify it, I do not think the statement should be placed in his context in your brief.

Dr. MACFARLANE: Mr. Chairman, I would like to answer Mr. Muir in these terms: there are difficulties attached to any attempt to measure productivity as a single factor, and I emphasize this in both statements. I may create the impression that such measures are worthless. What I really intend to do is to provide the committee with an idea respecting the limitations of these measures, that if computed in a certain way it would impute to labour gains which come from mechanization and automation with an industry. That was my major purpose. However, if you took a body of data for Canada and a body of data for the United States, and if you found a differential for the same period, then some validity could be attached to that findings.

Messrs. Hempson and Fullerton have done this, and discussed the limitations which is attached to this. But nonetheless the very fact that they were ready to print this 32 per cent figure suggests that it has some validity. This is parallel to the statement respecting wage differentials, and shows that lower productivity and lower wages go together, so that no one should get the idea that Canada has any great advantage because we pay lower wages in our farm implement industry. That is as far as I want to go.

Mr. MUIR (*Lisgar*): To that extent, then, you would say that there is validity in the statement that the man-hour output is lower in Canada?

Dr. MACFARLANE: I am sure there is something in it, otherwise these very creditable authors would not have ventured to print it. However, they do warn us about these measures.

Mr. MUIR (*Lisgar*): When the Canadian Labour Congress representatives were before us I quoted from the royal commission on Canada's economic prospects, page 239, where they said that Canadian secondary industry's output per man-hour is from 35 per cent to 40 per cent below that of the United States. They repeated this statement out of hand, and said that while it might apply to secondary industry across the border, it certainly did not apply to the farm machinery manufacturing industry. However, when I quoted the 32 per cent which was given for the agricultural implement manufacturing industry, they said—and I believe I am right in this—that they thought that might have been true when the report was written, but that since that time the man-hour output had gone up in Canada. I do not think that was too satisfactory an answer. Would you agree with me in that?

Dr. MACFARLANE: Mr. Muir, I should like to say that I agree with you. I took these figures from Hampson and Fullerton and attempted to bring their body of data, their measure or estimate, up to the 1959-60 level. But I could

not get results. I mean I could not get results I could be satisfied to present to this committee. The results I did get support the position which you have taken, and I do not think that there has been sufficient increase in productivity in this industry since 1953 to lead me to agree their statement. In fact, one has only to look at the rather small capital investments and capital improvements in order to suggest that even these partial labour productivity measures have not increased substantially. I do not think they have.

Mr. MUIR (*Lisgar*): When Mr. Voss of International-Harvester was giving his evidence he told the committee there were certain features of our manufacturing in Canada which were in effect less efficient. He was talking about the capital investment at the time and that on account of that certain features of our manufacturing were in fact less efficient than in the United States. He did not, however, lead us to believe that that was the whole reason why the Canadian farm machinery manufacturing industry was less efficient than in the United States. I believe we have to find something other than the fact of plant efficiency in bringing out the efficiency of the Canadian industry in regard to the United States counterpart.

Dr. MACFARLANE: I do not think I would agree. If you start attributing it to other than circumstances in respect of capital equipment, plant, and so on, you can easily come to a point where you are attributing it to some motives less than worthy on the part of labour, and I do not want to do that.

If I may pick up what I was saying a moment ago about the fact that I am not satisfied there has been this improvement, over recent years, in the Canadian industry, I would cite the fact that the industry is operating at about 50 per cent of capacity, and all these measures must reflect capacity. On the other hand, the United States industry operates at 80 or 90 per cent of capacity.

Mr. CLANCY: Let me interrupt. You were speaking about 80 or 90 per cent. You must come down to figures.

Dr. MACFARLANE: Mr. Chairman, I am saying that in the United States it is 80 or 90 per cent compared with 50 or 60 per cent here.

Mr. CLANCY: I am not prepared to accept any figures until you can prove them.

Dr. MACFARLANE: In this report I cite the D.B.S. figures. They are official, so there can be no question about them.

Mr. CLANCY: Give me the years and the proper reference.

Dr. MACFARLANE: I have it.

Mr. CLANCY: I do not want any more broad statements. This committee is here to work.

Mr. MUIR (*Lisgar*): Mr. Chairman, I would suggest that you allow the professor to give his answer to my question. I have another question which I would like to ask him which will arise out of this.

Dr. MACFARLANE: I would not want to miss replying to this other comment which has been made.

Mr. MUIR (*Lisgar*): You were on percentages. You were taking the United States percentage of 80 or 90 as against that of the Canadian percentage of capacity of 50.

Dr. MACFARLANE: 50 to 60. It runs all the way from 45.6 to 58.9.

Mr. HORNER (*Acadia*): Percentage of what?

Dr. MACFARLANE: Of the base capacity as at 1949.

Mr. HORNER (*Acadia*): You must remember there were more factories operating in Canada in the years 1949-51 than today, so your percentage in that regard is not too accurate.

Mr. CLANCY: May I point out that in 1947 we had just ended a war and had gone into the Korean war, where money meant nothing. If you are going to correlate those years to normal years, which I hope will continue—I am not looking for another war to boost the economy again—how can you justify this comparison?

Dr. MACFARLANE: I feel I can justify it, with the reservations which have been very properly made by Mr. Horner, which I quite accept.

Mr. HORNER (*Acadia*): Thank you.

Dr. MACFARLANE: Nonetheless, when D.B.S. tells me that the output of the industry has dropped from 100 to somewhere around 50 per cent—

Mr. HORNER (*Acadia*): Again, 50 per cent of what?

Dr. MACFARLANE: The physical volume.

Mr. CLANCY: 50 per cent of what—normal years or war years.

Dr. MACFARLANE: 50 per cent of the base output in 1949. We are now running at around 50 per cent of the 1949 output. We have not made many new additions to plants. International has done something, but if you look at the investment figures you will find the industry has not expanded greatly.

Mr. CLANCY: Can the witness tell me what the development was during the Korean war in output due to the war measures rather than straight industrial measures. If you are going to use those emergency figures and attempt to compare them, then I am not sure that it means very much.

Dr. MACFARLANE: It strikes me that 1949 was prior to the Korean period. Incidentally, even during the Korean period the industry dropped its output.

Mr. CLANCY: It took up the slack. In 1949 we were still catching up. The Korean war caught up on it. Now we are not going to have another war.

Dr. MACFARLANE: We have an industry in Canada which over recent years has operated at half of capacity. I could not get my hands on an exactly comparable series of United States output data, so I made my own in a perfectly comprehensible way by taking the figures every year from 1947 and deflating them to give us a figure which, for general purposes, would be comparable to the way the D.B.S. has prepared its figures. This is exactly what D.B.S. has done. It has taken the total output in dollars and deflated it by changes in price and, as a result, you get the index they publish. I did the same thing in connection with the United States, and you come out with figures over recent years which run from 80 to 88, I think. That is what I have done.

Mr. KORCHINSKI: Would you not agree that after the last war there was a sort of crash program, because of the fact that during the war there was no material and one was unable to buy anything? Then, following that, everyone went into the business of purchasing machinery and that sort of thing. In view of that, do you not think that it might not be regarded as a norm in that period?

Mr. CLANCY: How can you equate the end of a national emergency in 1947 and the three years of the Korean war with the normal business in Canada, or anywhere else? I do not care whether it is D.B.S. figures or not. They are under fire, as well, for some of their figures.

Dr. MACFARLANE: Not by me.

Mr. CLANCY: Well, they are, by me.

Dr. MACFARLANE: Yes. Of course, that is your right.

Mr. CLANCY: I am asking you how you equate that type of emergency. Up until 1947 we were under controls; then they were taken off, and we went into the Korean war situation. How are you going to equate that with a normal procedure? That is absolute malarkey.

Dr. MACFARLANE: Let me put it this way: I certainly agree with what Mr. Korchinski has said, that during the postwar years the output of industry was larger, due to satisfying the needs that could not be met during the wartime period. I am not saying that 1949 is a normal year at all. It certainly was influenced very much by those factors. Nonetheless, the industry did produce in 1949 a given output, which is here somewhere, and had a capacity to produce it. The output in 1949 was \$176 million. It had the plant to produce, and it had the plant to produce still more, in my opinion. The industry was not working at more than capacity in these earlier years, and I am saying that now it is working at far less capacity.

Mr. HORNER (*Acadia*): How do you establish the fact that in 1949 it was not operating at full capacity?

Dr. MACFARLANE: This is a belief I have come to, and it is a believe that a lot of economists have come to, whether rightly or wrongly, that in looking at this industry in the postwar years you feel it was operating roughly at capacity during the years of this large output. It is not doing that now. I have not defined capacity and, if you want to criticize me on this, I will accept the criticism. I have been making a general statement that during the good years of the industry it was operating pretty much at capacity, and there were two, and possibly three shifts working at the plant. This is my idea of capacity, and this does not happen any more.

Mr. MUIR (*Lisgar*): If I might, I would like to bring the witness back to my question, which had to do with plant deficiency in the industry, if you want to call it that; and what I am trying to establish between yourself and myself, sir, is, who are we going to pin the blame on for plant deficiency? I think labour has repudiated the figures you used in your brief. Industry, in one case, has suggested that perhaps their plants are not as efficient, and I think you were in the course of answering that question. Perhaps you have forgotten what the question is. If not, would you carry on with that?

Dr. MACFARLANE: I shall try. The studies or analysis would show the output per worker or per man hour in the Canadian industry has, over recent years, run well below the American figures for two reasons: the Canadian industry has not made very substantial additions to plant and equipment, where you get higher productivity, and the other reason is that the Canadian industry has run at a low output, and this, necessarily, because of the way these figures are computed, gives you lower productivity. I do not know that I can expand on these two factors any further.

Mr. MUIR (*Lisgar*): That is fine. I think evidence was given before that as the percentage of volume goes down, the man-hour output also goes down. However, one of the witnesses before the committee attributed this not wholly, but partially to the fact that union regulations impose on the manufacturer the necessity of using labour that is senior in the plant. That is, if they are going to have to shut down part of their manufacturing facility, the first people to go are the people with the lowest seniority, and yet they may be people who are doing an essential job, and are qualified to do it. According to the evidence submitted to us, these people are laid off, and other people with seniority are brought in to do that particular type of job, of which they have little or no experience, and, therefore, in his opinion, and I think rightly so—and I think you would agree with me—the man-hour output naturally goes down.

Dr. MACFARLANE: I would agree with that, I tried to cover that this morning, in a brief and broad statement, that almost in any industry you look into there are practices that appear to be economically indefensible. It is not to be wondered. I do not want to launch out on an attack on labour.

People within the movement have acknowledged some practices that have been carried on have not been in the interest of the economy as a whole, or the interest of the users of the product.

Mr. MUIR (*Lisgar*): Do you feel they are in the interest of labour itself?

Dr. MACFARLANE: I would have to answer: in the interest of what labour? Most of these seniority rules, and such, are only interests of some groups who are very powerful within the labour organization itself, and it may be proper that their rights should be protected. I am not ready to address myself to that one. But, in terms of the total economy, I would judge, no.

Mr. MUIR (*Lisgar*): In other words, perhaps it is better, as seems to be the situation today, to keep fewer men on at higher wages, than a lot of men at lower wages?

Dr. MACFARLANE: Well, I do not know, sir. Decisions on that matter may not rest as much with management as with labour. After all, management sets out the tasks to be done, and it has to recognize certain work rules; but, the scope of management in choosing the task to be done, I suspect, is much greater than the power of organized labour, as such.

Mr. MUIR (*Lisgar*): Then, have you any comments to make on the right under a democratic system, of every human to work? I have asked this question before, but did not receive an answer.

Dr. MACFARLANE: Did you say every union to work?

Mr. MUIR (*Lisgar*): No—every human to work—every citizen.

Dr. MACFARLANE: That is in the bill of rights.

Mr. MUIR (*Lisgar*): Regardless of whether he belongs to a union or not do you agree that a man should be in a union before he has the right to work, or has he the right to work regardless? That is a very simple question, sir, and it only requires a very simple answer. I would like to have your view on it.

Dr. MACFARLANE: Yes, but I would have to deliberate.

Mr. MUIR (*Lisgar*): I think I am entitled to an answer.

Dr. MACFARLANE: On the right to work question, I am afraid we have to accept some restrictions on the right to work because we recognize unions as legal bodies and we give them a good deal of power. Therefore we are necessarily up against defending some restriction on the right to work. At some time I hope we can organize our economy so that there will be work opportunities for everyone and so that the issue of the right to work will disappear.

Mr. MUIR (*Lisgar*): I think the fact that we do not have that right to work imposes a restriction or makes a hurdle over which we have no hope of getting.

Dr. MACFARLANE: This is a hurdle which has been authorized by national and provincial governments, and it is one which I think I would have to defend. I would have to defend some restriction on the right to work because we recognize that unions have certain rights as well as certain responsibilities.

Mr. MUIR (*Lisgar*): You do not think that the right of an individual comes first in a democratic country?

Dr. MACFARLANE: If the right of the individual means that we scrap the labour organizations and deprive the labour organizations of some of the most significant powers they have gained, then I would have to say that the right to work comes second. I am not ready to scrap our whole background in labour history yet.

Mr. MILLIGAN: I think we should turn to the graph on page 44, which explains this whole thing very well. There you have the agricultural output in 1958, and the number of production workers, and the number of salaried work-

ers, and I think it points out very well what Dr. MacFarlane was trying to bring out, namely, that productivity is away down in comparison with the number of workers that the companies had to keep on in order to produce, and also the salaried workers and the office help has remained pretty steady throughout the years. This has brought up labour costs within the different plants. Am I right in thinking that?

Dr. MACFARLANE: You are right.

Mr. FORBES: Mechanization in industry means fewer workers, while a dwindling labour force in agriculture is forcing the farm owner to become mechanized and spend large sums of borrowed capital on equipment. We find a situation in industry where labour saving machines are creating unemployment.

The total man-hours required to produce a refrigerator today, compared with a comparable model in 1952, has been reduced by over 40 per cent.

On the same basis, total man-hours required to produce an electric range decreased by over 25 per cent. And so it goes right on down the line. The opportunity is there for employment, and each worker is producing that much more today under automation.

Dr. MACFARLANE: That is right.

Mr. FORBES: I have one or two other matters to bring up. This morning Mr. Horner referred to the fact that Massey-Ferguson were manufacturing machinery in England. According to a press clipping, this machinery could be imported into Canada at a price lower than we would have to pay for similar machinery here. Now, in the *Hamilton Spectator* of April, 1960, Mr. W. E. Phillips of Massey-Ferguson Limited, had this to say:

It has become quite clear that Canada, as part of North America, is becoming one of the highest production cost areas in the world, and those who intend to survive commercially cannot ignore this ugly truth.

That goes right back to what Mr. Horner said this morning. Is that not due to the cost of labour in this country?

Dr. MACFARLANE: Certainly, among other factors.

Mr. FORBES: This should prove that labour costs are a large item in the manufacture of farm machinery in this country.

Dr. MACFARLANE: I suspect they are anywhere between 65 per cent to 70 per cent if you really went back and got all the components, back to the iron-ore mines. Something of that order, it might even be higher.

Mr. FORBES: I am glad to hear that you agree with us on that subject. Now, on page 2—

Mr. HORNER (*Acadia*): I thought I was to be second, after Mr. Muir.

Mr. FORBES: On page 2 of your statement this morning, you say:

If your committee would find the agricultural machinery companies operating contrary to the public interest, it would have to find evidence of conspiracy or collusion between the manufacturers in this field. No evidence has been presented in support of such a view. On the contrary, the courts in the United States, and independent economic analyses such as those presented in the outstanding works by Whitney and by Stocking and Watkins suggest vigorous competition.

How are we to know that the same conditions do not exist in Canada? In fact, owing to the price we have to pay for machinery, we are convinced that there must be some collusion somewhere. These are things we are trying to find out. Yet you said that these things are not borne out in Canada or the United States. I submit that by these facts they are borne out.

Dr. MACFARLANE: I have reviewed about 60 or 70 years of literature and half a dozen federal trade commission inquiries in the United States, as well

as many court cases, and I summarized the findings in terms that the charges have not—certainly if we go from 1918, when I think International was convicted under the anti-trust laws—but I would say that since that period—and that is why I referred to the 20's the 30's and the 40's. This does not mean that it does not exist. I do not know. I wish I could help you find the means of locating a combine, but I can't. But with respect to Allis-Chalmers you were talking about electrical equipment, while I was talking about agricultural machinery.

Mr. FORBES: Well, electrical equipment is a large item on farm machinery; you have starters, batteries, generators, ignition parts, and so on; it forms a large part in agricultural machinery.

Dr. MACFARLANE: I quite agree. When I prepared this statement I reviewed everything I could find. I did not find that clipping from the *Hamilton Spectator*, otherwise I would have a paragraph put in my statement limiting it somewhat. Your implication was that Allis-Chalmers was doing something illegal, which meant conspiracy or collusion. There have been many inquiries in connection with unfair trade practices which have resulted in not turning up much in the way of evidence; but there has been a good deal of positive evidence about pretty rough competition in this industry.

Mr. FORBES: It was not only Allis-Chalmers, but a number of other companies who were involved in the same thing. Without going into detail it named 12 to 15 companies involved in this collusion.

Dr. MACFARLANE: Yes, that is right, I remember it. I did not realize that Allis-Chalmers was one of the companies in that conviction.

Mr. CLANCY: In your brief you made the statement that the Canadian working man was 50 per cent less efficient than the American. That is something I cannot accept. Perhaps it was 32 per cent less efficient, or whatever it was. Then you said that you did not believe in feather-bedding, with the unions looking after redundant trades. Then you turned around and reversed your position on the right to work. We would like to know just exactly where you stand on the thing. I think your statement about the Canadian working man is wrong. I think he can do anything he wants to do. And I do not think that feather-bedding is too heavy. The unions themselves are tackling the subject. Then you turn around and reverse your position on the right to work, where you say there must be some denial. Your brief is not based on generalities, so you might as well keep on.

Dr. MACFARLANE: Let me say that the figure on the differential in productivity between Canada and the United States is based on one of the royal commission reports. I suggested acceptance of it, although I warned the committee that the authors themselves are not too satisfied with the figures, give or take several percentage points. And I am not surprised that the research shows lower productivity for Canadian industry. Now, with regard to the other question, I think I can clarify it for you.

Mr. CLANCY: When I use the term feather-bedding, I mean the retention by unions in negotiations of redundant trades, which we know has gone on. We know, too, that unions today are moving forward to do away with that type of negotiating.

Dr. MACFARLANE: The unions are forced to give up redundant trades because of changing techniques and changing productive processes, and changes in the whole definition of jobs, which occur from year to year. In this case I do not worry about what was called feather-bedding. I think it was a railway term. There are not "a second fireman" on machines at International.

Mr. CLANCY: It was you who made the statement, not I.

Dr. MACFARLANE: I am not concerned. I think there is progress in most industry. Where you give a labour union high legal rights or power, they tend to go towards practices which may not be in the general interest.

Mr. CLANCY: In other words, towards more redundancy of trades in a job. Do you not agree with me that unions are moving forward now, and gradually getting out of that type of thing?

Dr. MACFARLANE: Surely they are; and I do not like that word "redundant".

Mr. CLANCY: There are redundant trades. After all, if you work in a certain plant and you see that a certain trade is disappearing, you are not going to be paid to sit around for eight hours a day and do nothing.

Dr. MACFARLANE: The workers are not doing that. They are being trained for another job. I like the illustration given by Mr. Muir much better. He referred to seniority rights. I do not want to deprive people of seniority rights, even though it may not be in the interest of the buyer of farm machinery.

Mr. CLANCY: My last question is on this right to work. You qualified your answer on the right to work and you said that there has to be different categories. Why?

Dr. MACFARLANE: Because the people of this great country have ordained labour legislation which gives unions rights, and protects their right to restrict the right to work.

Mr. CLANCY: In other words, you agree that the labour union decides who works in Canada, and not the people?

Dr. MACFARLANE: The labour union has a certain power over who has the right to work in a given situation.

Mr. CLANCY: And there is no appeal from the decision of the labour union?

Dr. MACFARLANE: There may be an appeal to the courts.

Mr. CLANCY: There is no appeal to the courts. You know that.

Dr. MACFARLANE: I do not know it.

Mr. CLANCY: Let us put it into the courts and let them appeal.

Dr. MACFARLANE: That is fine. I agree that the courts should deal with it.

Mr. HORNER (*Acadia*): My question is along a somewhat different line. Dr. MacFarlane made reference to free trade and the removal of tariffs; and in the last sentence of the statement he gave us this morning he wonders if the committee will have something to say with respect to means of strengthening the Canadian sector of the North American industry. I find this whole subject quite interesting. My first question is this: before world war II, Canada exported farm implements to Australia, New Zealand, the Argentine, the United Kingdom, and South Africa. On the other hand—and please correct me if I am wrong—today our exports are going to the United States, and that is it. Why, in your view, do you think this has come about?

Dr. MACFARLANE: Mr. Chairman, I would answer Mr. Horner in the terms of the statement that Canada lost her export market overseas very largely during the period of dollar shortage when the British had to devalue; and there was a period of nine or ten years when dollars were not available for purchase, when the United Kingdom and other countries in the sterling area would not provide dollars for the purchase of these products. The market went then. It was not picked up when the dollar shortage was alleviated, for the reason that some of these companies moved some of their operations to the sterling area to the United Kingdom and to South Africa, and there has been a great expansion of production in those countries. I think that this, more than anything else, means that our exports have been diverted from the sterling areas around the world in general, and from the European continent to the United States.

Mr. HORNER (*Acadia*): Do you know of anything that exists? As the John Deere Company suggests, Argentina has now imposed some sort of control whereby if you want to import any machinery into Argentina, the whole product cannot go in. It must be assembled or partly manufactured in that country. This would be in some respects trade restriction. Do you know of any other country where this situation exists today, I mean a country where Canada used to trade?

Dr. MACFARLANE: Frankly, I do not know. I think that Australia did this with regard to their motor-car industry, but I am not positive.

Mr. HORNER (*Acadia*): I am talking about the farm implement industry, mainly, because that is what we are concerned with in Canada, but you do not know of any other country, and you do not think there are any others?

Dr. MACFARLANE: I do not know of any others.

Mr. HORNER (*Acadia*): Is it not true—and you deal with this in your main brief—that the tractor is the main component used on farms in Canada and on the North American continent today? I think that Massey-Ferguson said that their production was 45 per cent tractors.

Dr. MACFARLANE: About half the sales are for tractors.

Mr. HORNER (*Acadia*): Is it not true, also, that about 1917 the duty was removed from tractors coming into Canada valued at less than \$1400?

Dr. MACFARLANE: That is right.

Mr. HORNER (*Acadia*): And right about then, or at the same time, Henry Ford captured 80 per cent of the market with a tractor selling for less than \$1,000? Do you agree?

Dr. MACFARLANE: I would have to.

Mr. HORNER (*Acadia*): So this trend of Canada to import tractors and perhaps export other implements started quite a long while ago, and it has perhaps become intensified because of the greater mechanization of farms today?

Dr. MACFARLANE: I agree.

Mr. HORNER (*Acadia*): And, in fact, in 1935, the duty was removed from tractors?

Dr. MACFARLANE: That is correct.

Mr. HORNER (*Acadia*): The thing which amazes me—and I see from the book which you suggested we all read—I mean the book that was written by Mr. Phillips on the agricultural industry in Canada—I think we must bear in mind that in 1937, Cockshutt, it is recorded, met with difficulty in breaking into the American market; and in another brief which was also submitted to this committee, they again re-emphasized the difficulty in breaking into the United States market, because the farmers in that country prefer United States made products. This is what Cockshutt suggest. I have no knowledge of this. In reading from this book by Phillips at page 161 I see there is a statement on which I am wondering if you have any comment:

Americans are permitted to reap the benefits of government-guaranteed credit arrangements in Canada under the Farm Improvement Loans Act, but Canadians selling in the United States are deprived of this advantage.

What is he getting at? Are Canadian manufacturing companies not permitted every advantage that an American manufacturing company is in the United States?

Dr. MACFARLANE: I do not know what Mr. Phillips was getting at. I cannot imagine that under the American farm credit schemes that dealers

who are selling Canadian made machinery would have any barrier imposed on them. I do not know of any, so I cannot tell you what he is getting at in that quotation. I recall being worried about it when I first read it, but I have never cleared it up.

Mr. HORNER (*Acadia*): This is quite an important thing, when we consider we have companies such as Massey-Ferguson and International. Cockshutt, however, has not been as fortunate. They still claim they are having some difficulty in getting into that market. This is quite an important statement to the effect that Canadians selling in the United States are deprived of this advantage. I think that someone, either D.B.S., someone submitting a further brief, or even myself, should look into this and endeavour to find out what he means by that particular phrase.

I have one further question along this same line of production and volume of production. You have emphasized that the volume of production in Canadian plants is going down. I am not going to question your figures, although I believe you omitted some of the important factors. Do you not think, however, that world volume has perhaps increased to quite an extent? Massey-Ferguson, for instance, has a manufacturing company in Great Britain, International has built a plant in Scotland, and John Deere is manufacturing in two plants in Germany. Do you not think these companies, to some extent, are taking advantage of the cheaper costs over there?

Dr. MACFARLANE: I think that would be right. That would be one incentive which led them to expand production in the United Kingdom, on the European continent, and elsewhere. I attach some importance, however, to the fact that this was done in a period when there was a dollar shortage.

Mr. HORNER (*Acadia*): Has International not just recently built this plant in Scotland?

Dr. MACFARLANE: I think this is true.

Mr. HORNER (*Acadia*): As I understand it, the dollar shortage has gone.

Dr. MACFARLANE: Yes.

Mr. HORNER (*Acadia*): Then this would not be true in respect of International. I might point out that two years ago, I think, Massey bought Standard Tractors in Great Britain since the dollar shortage. Did North American farmers not actually provide the profits for these companies to establish these plants in the other countries and enable them to take advantage of lower production costs? The question I would ask is: are we in Canada and the United States reaping the benefit of these lower production costs? Do you have any knowledge of that?

Dr. MACFARLANE: No; I have no direct knowledge of that.

Mr. HORNER (*Acadia*): Last year we imported roughly 7,000 tractors into Canada from countries other than the United States; 6,426 from Great Britain alone which came in valued at \$1,525. I would readily agree that most tractors coming in from Great Britain would range in perhaps what would be classed as four-plow and down. However, we imported 21,851 tractors from the United States. I will readily agree that they would more than likely be the larger tractors, but not all of them, because Minneapolis, Case and Oliver all manufacture small tractors in the United States and bring them into Canada. After figuring out the average value it came to \$3,323. In purchasing tractors in Canada the farmers do not notice this difference. From these figures I suggest that the farmers in Canada and on the North American continent are not reaping the benefit of the lower production costs which the companies have developed in other countries because they were able to use the profits they made when selling machinery to us during the early 1950's and late 1940's. Have you any comment on that?

Dr. MACFARLANE: Essentially you are saying that the tractor imports from the United Kingdom are in the lower horsepower models. I would quite agree to that. In addition you have said that those from the United States are the larger tractors. With regard to the suggestion you leave, to the effect that we are not getting the benefit, I would have to have more information on the mark-ups which apply to tractor imports from the United Kingdom.

Mr. HORNER (*Acadia*): I have just taken the figures and my arithmetic shows that \$1,525 is the average price in respect of the United Kingdom and \$3,223 in respect of the United States.

Dr. MACFARLANE: I suspect these imported tractors from the United Kingdom are being sold for as much as the companies can get. If this leaves the Canadian farmer at some disadvantage, I expect that would be it.

Mr. HORNER (*Acadia*): This is the point I wanted to hear. In other words, we farmers in western Canada are charged all that the company thinks the market will bear.

Dr. MACFARLANE: I have said that three or four times.

Mr. HORNER (*Acadia*): I realize you have.

Mr. DANFORTH: Would you omit the word "western" and say "we farmers".

Mr. HORNER (*Acadia*): Yes. We farmers in Canada are charged all the market will bear. You agree with that. Actually we are reaping no benefit today from having free trade established, because we are not getting the advantages we thought we would out of it. I would not say wholly, but rather to some extent. I am free trader; do not ever doubt that. However, I do want the committee to investigate this possibility.

Mr. MILLIGAN: I do not quite agree with Mr. Horner's suggestion. Why would we be selling so many Fiat tractors brought in from Italy? I was speaking to a dealer who told me that his main sales have been in these tractors.

Mr. HORNER (*Acadia*): There were 470 tractors imported from Italy last year compared to 29,000.

The point I have been making is that the major farm machinery companies are making these tractors in Great Britain for less and are not selling them for less in Canada.

Mr. KORCHINSKI: On the first page of your statement you say "it is a blunt fact that capitalist economies have not provided fair shares to an important capital owing class—the farmer". In other words, if you give the farmer a greater return he would just charge more. Is that a fair assumption?

Dr. MACFARLANE: Let me attempt to clarify this. It has been stated that we can buy the British Ford tractor for \$1,000 less than a model made in Canada or in the United States. This is what I call competition. It looks as if Ford is on the way to going back to 80 per cent of the market again. So long as there is no restraint on Ford, then the farmer will get the benefit of the competitive situation. If the \$1,000 figure prevails, it will be a very strong force in bringing the American made tractors down into line. This is what I mean by competitive industry.

Mr. HORNER (*Acadia*): I think we agree that it is a competitive industry. The point is, however, that the North American farmers supplied the profit for Massey-Ferguson to buy and build into two manufacturing plants in the United Kingdom. We also supplied the profit for John Deere to build two manufacturing plants in Germany, supplied the profit for the plan built in France and in Italy, and for International to build in Scotland, and yet we are not reaping the benefit of this.

Mr. SOUTHAM: Mr. Chairman, I am sorry I was absent from the committee this afternoon for an hour or so. I had to be in the house at that time. In respect

of the question concerning the difference in productivity between labour in Canada and the United States, I am wondering whether or not the question has been brought up as to the relative population distribution in the North American continent whether or not this has had any effect on it. There were statistics given here to the effect that there is 25 or 30 per cent less productivity in Canada than in the comparable labour force in the United States. Has the population distribution any effect on this?

Dr. MACFARLANE: In answer to that question I would say that certainly the size of the market has a very large bearing on it. It may be one of the most important factors in the general statement made by Mr. Muir the other day to the effect that there is roughly 35 per cent less productivity in Canada in secondary industry. I think the size of the market is a major factor in the farm machinery industry. I suspect that farmers are getting the benefits of American productivity and that Canadian industry has to live up to it. I think in this sense the farmer is in an advantageous position in buying goods in such a market.

Mr. SOUTHAM: I am wondering if we are over-industrialized on the North American continent now in respect of farm machinery. If so, this would help to keep the cost of the products up.

Dr. MACFARLANE: I think this opens a very important area of the problem and one which is risky for me to get into, because I am not an industrial engineer. My suspicion would be that without saying the Canadian industry is over or under capitalized, I would say that it has not made enough investment in capital that have given it more productivity. Certainly it looks as if any industry that operates at half capacity is over capitalized. I would make the modest suggestion that we should find means of getting new investment in the Canadian industry in those areas in which we can and do specialize, in such things as hay balers and combines. If something could be done to enlarge the investment in Canadian plants with a view to greater efficiency, it would increase their ability to penetrate the United States market. Mr. Horner said that we produced the same products in Canada as in the United States. I do not think this is true. We produce combines and hay balers in Canada and tractors in the United States.

Mr. HORNER (*Acadia*): In some companies. The three big companies in North America are John Deere which produces all its combines in the United States, International which produces a lot of combines in the United States, and then J. I. Case is the third ranking one in the United States. They make all their own combines down there, too. I think it has to be looked at in this way.

Dr. MACFARLANE: I would accept this, and I would hope the committee might have someone work on the problem of whether it is possible to get a greater production of farm machinery in Canada. I think International is working in this way, in its Hamilton operation. A larger proportion of their output is being exported year-by-year, due to specialization in specific types of equipment in Hamilton, which they can ship to the United States market.

When I talk about increased productivity in this industry, I mean pursuing every possible opportunity to get this specialization which would give us, in Canada, the major production of some machines. I do not know whether or not John Deere is working in this direction, but I think they said that there is a substantial part of their Canadian production exported. Perhaps I have been over-intrigued with the continental industry.

Mr. HORNER (*Acadia*): I think one must consider this on a worldwide industry basis, now.

Dr. MACFARLANE: I would agree with you. This is something which intrigues me, and I think we should pursue it further. I hope the Canadian industry is sufficiently efficient to penetrate United States markets more than we have in the past. This is our only hope.

Mr. SOUTHAM: I was quite concerned with this statement in your summation, when you said the industry has operated at about one-half of its capacity since 1954. I think that gives room for thought.

Mr. HORNER (*Acadia*): I would like to put this statement on the record. In connection with this half-production, in 1949 there were over 17,000 employees while, in 1958, there were only 11,000. Then, in 1949, there were some 80 manufacturing plants in Canada, while today there are only about 70. My purpose in mentioning this is that I think you must consider this in its true perspective. You would not expect 11,000 workers today to put out what 17,000 put out in 1949.

Dr. MACFARLANE: I agree.

Mr. HORNER (*Acadia*): I think this is being over-emphasized.

The VICE-CHAIRMAN (*Mr. Smallwood*): Have you some questions, Mr. Pascoe?

Mr. PASCOE: Mr. Chairman, I indicated this morning that I wanted to ask some questions along the line of factory worker productivity, and I believe, since then, the members have exhausted that subject. However, I have one direct question.

I quote from page 17 of the brief:

They conclude that in agricultural implements, despite the downward trend in Canadian productivity in recent years, productivity per man hour on a value-added basis is shown as some 32 per cent below the United States...

That is a quotation which is not your own. You have taken it from another book. I would like to ask if you have anything in your brief that bears this out, or are you taking it as a direct statement from another book?

Dr. MACFARLANE: I have taken it as a direct statement from a very excellent source. This is from one of the volumes in the Gordon commission series, and they had to work in one of the most difficult areas. I give these people full marks for what they have done. This is more because of the backwardness—this is not the right word to use; we do not have the industrial statistics required to do as good a job as we would like to. Give us the statistics, and the economists will be able to do a better job on refining this. However, I accept this as a general picture of the situation which prevails.

Mr. PASCOE: There are no remarks in your own brief to bear this out.

Dr. MACFARLANE: That is right.

The VICE-CHAIRMAN (*Mr. Smallwood*): Have you some questions, Mr. Danforth?

Mr. DANFORTH: Yes, Mr. Chairman. I have some questions I would like to direct to the witness. However, first I would like to go on record in commending the witness for this very excellent presentation. I feel that if farmers have an opportunity to read this, they will be far better informed as to the problems they are facing in regard to the pricing of farm machinery.

My questions are merely for my own information, further to the information you have given here in the brief.

The first one concerns page 24, in connection with the market variables which influence the price of farm machinery. You include the price of steel in here, and you say that the outlay of steel is one of the major costs of producing farm machinery. Now, it is quite apparent that you have gone into

this very thoroughly, and I was wondering what percentage—using any machine you would care to use as an example—you would say that the increase in price should be in any one year, normally, due to the increase in the price of steel? I ask this because I know of an instance when steel went up \$1.50 per ton and, at the same time, the price of a self-propelled combine went up \$450. At that time, they told me the increase was due to the increase in the price of steel. I am not familiar enough with all the ramifications to know just what an increase in the price of \$1.50 a ton should mean to the increase in the price of a piece of machinery. However, I do know that many farmers question the fact that an increase of \$1.50 per ton means an increase of \$450 on a self-propelling combine.

Dr. MACFARLANE: I think they would be right in questioning it.

Mr. DANFORTH: Then, could I have your opinion as to how much the increase in the price of steel would directly affect the increase in the price of an implement.

Dr. MACFARLANE: The price of steel has gone up, roughly, in the same terms as the price of agricultural machinery, and that was shown in a supplementary statement that was distributed to you this morning.

Mr. DANFORTH: Yes, I have it.

Dr. MACFARLANE: So, you have a whole complex of costs entering, and I have listed some of them here, with steel going up a little less than farm machinery prices, and labour going up a good deal more, and rubber going up a little more. Pig-iron, to the extent it is used, is less, and so on. You have asked a very difficult question.

Mr. DANFORTH: Your data, which is very complete, sir, gives the end result.

Dr. MACFARLANE: Yes.

Mr. DANFORTH: My question is based on the fact that a farmer has said the price of farm machinery goes up in any one year by 10 per cent, because of the increase in the price of steel. Now, we know that steel does not go up to that degree in any one year, and I am wondering what, in your estimation, would be a normal increase in the price of farm machinery as compared to an increase in the price of steel.

Dr. MACFARLANE: Well, I can answer, perhaps not too helpfully, by—

Mr. DANFORTH: Would you feel, knowing the gradual increase in the price of steel, that a company would be justified in putting the price of a self-propelled combine up 10 per cent due to an increase in steel?

Dr. MACFARLANE: I would have grave doubts. I think steel accounts for something in the order of 20 or 25 per cent of the factory value of shipments from the agricultural machinery industry.

I do not like the idea of identifying price increases with costs, in any event, because I take the position these companies will go out and get every penny they can get. They will judge by the market more than by the costs. I do not agree when someone says that the price of automobiles go up because of the price of steel. Certainly, costs must be taken into consideration, but the cost of automobiles going up is due to the fact that it is profitable for the companies to put them up. I think the demand for the product is much more important than the cost, even to the point of saying that you will be getting misleading results if you try to relate back to costs on these things. I think there is this complex of costs on the one hand, and of demand on the other, and of these two, demand is far more important.

Mr. DANFORTH: Then, supplementary: Would you agree with the statement made here by more than one witness—taking any basic machine as an

example—that a knowledge of the cost of labour for a machine and the material involved in the machine would not have too much bearing on the end result, the price to the farmer, and that that information would be of very little value to this committee?

Dr. MACFARLANE: I take that point of view, sir.

Mr. DANFORTH: Because of the fact there are so many other factors contributing to the cost of the machine?

Dr. MACFARLANE: Yes. I was making my general statement in terms of the whole industry, and it is even more true if you get down to the individual implement.

Mr. DANFORTH: Then you would agree with the statement of these witnesses that any specific details, to that degree, would help us very little in determining the price of the finished implement?

Dr. MACFARLANE: I agree.

Mr. DANFORTH: Then, there is another point which I would like expanded further, for my own personal satisfaction, and it deals with competition and merger. I thought that if the shares of the market fell into fewer hands, they would have more of a chance to control the market. You speak of competition through merger, and my question is directly because of the fact you state that in 1922 there were three major companies handling different classes of farm machinery, and now there are eight. I would think the fact that there are eight now would mean it was very profitable and that the other five machinery companies have gone into it to take advantage of it. Yet, your premise is that through merger and less outlets, there is a greater competition. Would you clarify that?

Dr. MACFARLANE: Yes, I will expand on this. The possibility of competition, through merger, is suggested by the fact that when you are selling to farmers, if you are selling on the basis of a full line, you have a very strong advantage, and, therefore, with additional full line companies there is greater competition. When you had three full-line companies, the market was dominated by them and the competition, so far as full lines was concerned, was between the three. These full-line companies had a real advantage, because of their full lines, and if you can expand that competition from three to eight, by getting additional full-line firms, you have increased competition in the industry. I put this in here—and I was amused by it—since it is general to identify a lack of competition with mergers. But mergers in this case resulted in more full-line companies, competition increased.

Mr. DANFORTH: Am I to understand that my interpretation of merger was incorrect? My idea of merger is that two full-line companies, (a) full-line company and (b) full-line company merged, whereas your idea is a merger of a number of companies, partially producing, in order that a full-line company would be the end result.

Dr. MACFARLANE: This is my interpretation, and I think the history of the industry would bear it out.

The mergers we are referring to, when we move from three to eight, were mergers of partial line companies into full-line companies, and not mergers of full-line companies at all.

Mr. DANFORTH: I have another question—and I am just going through your brief here and there. Another thing which interests me is where you say that it is not generally conceded now that patents are a restrictive device for a monopolistic control, and you state, in your findings, that no more than two or three per cent are protected by patents or royalty, and your premise is based upon that. The only reason I question this is the fact that I firmly believe that the control of these two or three per cent may have a definite

bearing on monopolistic control, and I use as an example, this suit between Ferguson and Ford over the three-point hitch. Would a patent such as that not have a very definite bearing on price-fixing and control of the market?

Dr. MACFARLANE: I agree. The reason I put this statement in was that I was as much surprised as you were that while there may be some very important things in this two or three per cent which may still be protected by patents, the fact that the industry is as free of effective patents was a very striking thing to me. I thought before I got into this show that patents were very important, and yet here is International, which has the most of any in the world, and they have released about 95, or possibly 98 per cent of them. I was surprised to find this, and I thought that your committee, and those who read these proceedings, would be interested in this fact.

Mr. DANFORTH: I have one other general question, and then I will pass, for the time being. This is a question in which we all have been interested. As a result of your investigation—and it has been quite thorough—I would like to ask, sir, if in your own personal mind, you feel that there is any possibility of a combination between major companies for price-fixing? I am asking only for a general statement. Do you feel that such a combination could exist?

Dr. MACFARLANE: I feel that such a combination could exist, and I feel much more strongly that no such combination does exist. I judge the firms in this industry, so far as pricing is concerned, that they are set not only at arm's length, but much further, that there is no suggestion of it. I know you brought up the question, or someone else did, in connection with Allis-Chalmers. I did not like what I heard, and I do not want to absolve anyone. However, I have talked to people in the farm equipment institute, as well as industrial people. Also, I have made my own observations, especially observations on what happened with shares of markets and so on, and there is no reason for me to believe that any combination has existed because, where these combinations have existed, you can trace some pattern in pricing, or shares of the market, or in some other way which you cannot pin down in this industry:

Mr. DANFORTH: Could I say, then, that on the basis of your extensive investigation, such a combination is possible, but not probable?

Dr. MACFARLANE: Such a combination is possible and highly improbable.

Mr. FORBES: Then, is it your opinion that it would cost Massey-Ferguson almost an identical amount to manufacture a combine, as it would cost Cockshutt?

Dr. MACFARLANE: No.

Mr. FORBES: Then why is there not a differential in the price?

Dr. MACFARLANE: Because it is determined by the market, and not by costs.

Mr. FORBES: In other words, you believe the companies will charge all the farmers will pay?

Dr. MACFARLANE: I have said that sixteen times already. This is my contention. They charge what the traffic will bear.

Mr. PASCOE: Dr. MacFarlane has been talking about competition between companies. Would you express your views on the suggestion of nationalizing these companies?

Dr. MACFARLANE: I suspect that with nationalization, you would lose some of the dynamic inventive and innovational qualities the industry has had, although I am not totally opposed to it. I reserve nationalization for industry where collusion and conspiracy has been proven, and where it is clear the

national interest has not been served. Then, I say, "All right, let us nationalize." However, up until that time, I am all for as much competition as you can get.

Mr. HORNER (*Acadia*): I have a supplementary on this. Do you feel that the farm machinery industry should be no more nationalized than the grain storage industry in western Canada? The government there pays grain storage to large elevator companies, whereas, if it nationalized this, that money could be saved.

Dr. MACFARLANE: There is less reason for nationalizing the farm machinery and equipment industry than there is for nationalizing grain storage, for the simple reason you have already set the price for grain storage, and nationalization is only one step further in that same pattern.

Mr. MCINTOSH: You made a remark in connection with nationalization; would you say the same thing about standardization?

Dr. MACFARLANE: You will observe I have stayed away from things I know nothing about, and one is engineering. I get the impression that standardization is proceeding, but I think it is proceeding too slowly. I realize what the machine companies have told you, that to standardize is to put some brake or impediment in the way of innovation, but I wish the industry itself would move faster towards standardization, and I hope we shall see that. I hope they do that outside of pressure or threat of nationalization, or even government pressure. They have already made significant improvements in this area.

Mr. MCINTOSH: You feel it is desirable?

Dr. MACFARLANE: Yes.

Mr. MILLIGAN: I certainly appreciate this brief because I feel Doctor MacFarlane, in preparing it, has given us more factual information on the economic position of the industry, and of agriculture, than we have had in any other brief. In fact, I would like to say this brief could be of great help to members of the committee in preparing our report.

Now, Doctor MacFarlane, I noticed you were present during some of our previous hearings, and I would like to know if your brief has been prepared from information you received from listening to the briefs submitted by the machine companies and labour organizations?

Dr. MACFARLANE: In answer to Mr. Milligan I would say this work started last December and was pretty well along before these hearings commenced. Nonetheless, my work has definitely been affected by what I heard and read in the other briefs.

Mr. MILLIGAN: On page 50 you have a chart showing profits before taxes, and as I see it you have secondary industries with much greater profits than the agricultural industry. Do you feel that, in general, the profits of the agricultural industry have not been as great as other secondary industries?

Dr. MACFARLANE: Yes. I think in the data presented with respect to the United States sector this would be true, and I believe if we pursued further the data available through Canadian income tax you would also find the same to be true particularly—but let us stop at that. I think this would be true.

Mr. MILLIGAN: I feel our questioning has been very broad, and we are missing an opportunity to get some first hand information from an independent source which has given a great deal of study both to the agricultural position and to the position of industry. Would I be right in assuming that throughout your brief you indicate the problem we are facing today is more the economic position of agriculture, and we might have to bring the whole problem of agriculture and the economic position of agriculture up in line rather than attempt to bring the prices of farm machinery down, so that farmers will be in a better position to pay the prices for farm machinery?

Dr. MACFARLANE: I feel very strongly in agreement with the position you state, and at the same time I recognize the real difficulty about doing anything very substantial on the farm income problem. I make reference to it in both statements, and I say if you are going to leave it in a kind of free economy context then we have to get very substantial adjustments of people leaving agriculture, of reduction in the number of farms, and the increased capitalization of farms. If you can get these fast enough you would have a pick-up in farm income. At the same time I admire the steps the government has taken, and its concern about the position about agriculture. Perhaps you are not asking me this, but my personal view is that still more aggressive action can be taken on the income problem. I should not have said that, because I really do not want to be examined on it as, if I were, we would probably be here until midnight.

Mr. FORBES: If the government were to increase farm income, according to your brief the machine companies would continue to increase their prices and the farmers would gain nothing at all.

Dr. MACFARLANE: The machine companies might increase their prices. They would find the market much more profitable if farm incomes went up, but I have a strong feeling that not all the farm income increases would go into increased farm machinery costs. In fact I hope we get a situation in agriculture where agriculture will move up rather faster than the rest of the economy.

Mr. HORNER (*Acadia*): I have just one brief supplementary question to that. You agree that farm income must also increase in the United States in order to improve the agricultural implement industry?

Dr. MACFARLANE: Well, Mr. Horner, I have said the American sector of the industry is not too badly off, though profit-wise it is not so well off. Its output, however, is much higher in terms of its capacity, but I do not want to get on to paying my respects to farm income support programs in the United States.

Mr. HORNER (*Acadia*): The farm implement industry is a North American industry and, in fact, is a world-wide industry. We can no longer look upon it as purely Canadian, and from a purely Canadian viewpoint. Therefore, the position of farmers all over the world would have to be improved tremendously in order to improve the farm implement industry. Is that a proper assumption?

Dr. MACFARLANE: Yes, that is a proper assumption.

Mr. HORNER (*Acadia*): A thought has just crossed my mind which I should like to clarify before proceeding. Would this be a fair question, Doctor MacFarlane? Are you the same person who appeared as chairman of the agricultural seminar at the Liberal convention?

Dr. MACFARLANE: No. I think the name is wrong. I was invited to the Queens meetings which were, I think, sponsored by the Liberal party. I am not sure about that, but I did appear there.

Mr. HORNER (*Acadia*): Were you chairman?

Dr. MACFARLANE: No.

Mr. HORNER (*Acadia*): We have had coloured briefs before, and I wanted this put in proper perspective.

Dr. MACFARLANE: There is no political colour in this.

Mr. HORNER (*Acadia*): When discussing cost components, the John Deere company made the statement that the greatest price increase appears to be in those products which have a relatively greater amount of labour in them. Generally, would you agree with that submission made by the John Deere company to this committee?

Dr. MACFARLANE: I am afraid, Mr. Horner, this would take an engineering knowledge that I just have not got.

Mr. HORNER (*Acadia*): You would not even give a view?

Dr. MACFARLANE: I do not think I could give a useful one, and for that reason I had better not give any.

Mr. HORNER (*Acadia*): On page 8 of your brief you say four industries in Canada earned more than over \$5 million worth of sales. Where did you get that information?

Dr. MACFARLANE: I believe from the most recent agricultural implement industry report.

Mr. HORNER (*Acadia*): I have it before me, and it says on page 15 that five implement industries sold more than \$5 million worth of goods.

Dr. MACFARLANE: Is that on page 8 of my statement?

Mr. HORNER (*Acadia*): Yes, page 8 of your brief.

Dr. MACFARLANE: I shall stand corrected and ask the chairman if I may have permission to correct the brief I filed, if it is wrong.

Mr. HORNER (*Acadia*): I might say that in 1957 there were only four, but in 1958 there were five.

At page 30 of your brief you talk about the "downward sloping individual demand curves". This tends to convey to me that farmers' purchases of machinery really set in for the first time from 1947 to 1952, and from that time on we have had a downward curve in the demand for farm machine company products, because the initial big purchasing drive was over. Does this hold true? Do I interpret your remarks correctly?

Dr. MACFARLANE: I think I could clarify this. My intention in talking about a downward sloping demand curve for an individual firm is to describe a situation that does not meet the economist's standard or criterion of competition, and I state somewhere that there are three requirements, an upward rising costs curve, a horizontal demand curve for the individual farm, and I have forgotten what the other was. This does not bear on the conclusions you are ready to draw. This is merely a definition of what an economist means by a competitive industry.

Mr. HORNER (*Acadia*): I am glad you have given me your view on this. Now, on page 63 you deal with capital investment on farms, and you say that for 1959 the total for all of Canada was \$20 million. Am I right?

Dr. MACFARLANE: \$20 billion.

Mr. HORNER (*Acadia*): You have livestock and machinery listed in this, and I notice there is a slight gain in machinery for all of Canadian dollar value from 1951 to 1959. Is that right?

Dr. MACFARLANE: Yes, that is correct.

Mr. HORNER (*Acadia*): And livestock held relatively constant, with a slight gain?

Dr. MACFARLANE: That is right.

Mr. HORNER (*Acadia*): Even taking into consideration the high prices for livestock in 1951, and the power prices in 1959?

Dr. MACFARLANE: Yes.

Mr. HORNER (*Acadia*): This would tend to illustrate that livestock numbers are substantially up, to take care of the loss in value?

Dr. MACFARLANE: No. I think if you want to get aggregate capital investment in the industry we should be on page 62. Page 63 deals with it on a per farm basis.

Mr. HORNER (*Acadia*): But I think the same holds true.

Dr. MACFARLANE: It holds generally the same way. I just wanted to clarify it.

Mr. HORNER (*Acadia*): This would be a proper assumption to make from your tables?

Dr. MACFARLANE: Yes, I would agree with that.

Mr. HORNER (*Acadia*): On page 62 you are saying the average farm today has a capital investment of \$20,000.

Dr. MACFARLANE: Yes.

Mr. HORNER (*Acadia*): And in 1951 it had a capital investment of \$15,000?

Dr. MACFARLANE: Exactly.

Mr. HORNER (*Acadia*): In other words, the farmer's capital investment has been going up. Would it be correct to assume that?

Dr. MACFARLANE: Yes, that is correct. It is going up for two reasons, one being the inflationary trends, and the second being increases in real amounts of capital—more livestock and more machinery.

Mr. HORNER (*Acadia*): I have one other question. You have suggested moderate profits but, according to your table on page 48, the profits of the John Deere company seem to me to be rather high for the year 1959. According to your table they made profits before taxes of \$101 million on gross sales of \$551 million, which is pretty near 20 per cent. Would you not say that this is a little bit better than moderate profits?

Dr. MACFARLANE: I would say that if one particular industry makes a high profit, this does not characterize the whole industry. I do not know to what extent—but this is mainly on the United States operations and to some extent on operations in other countries. Of course, this is consolidated. I would never deny that this company has made the highest profit out of the four I have listed, in terms of equities.

Mr. HORNER (*Acadia*): This is more than moderate profits, I think.

Dr. MACFARLANE: I think this is right.

Mr. HORNER (*Acadia*): In this same table you include International sales. Are you including trucks in that figure?

Dr. MACFARLANE: I include trucks because they include trucks. This is a consolidated sheet.

Mr. HORNER (*Acadia*): International also made steel stock racks for their trucks. These would be included in this table?

Dr. MACFARLANE: They used to make refrigerators, but they do not do so any more.

Mr. HORNER (*Acadia*): They quit.

Dr. MACFARLANE: Yes, they quit, because of competition.

Mr. HORNER (*Acadia*): I will forego other questions right now if someone else wishes to go ahead.

Mr. SOUTHAM: Here again I may be out of order as I was unavoidably absent for a half hour or so. If this question was asked already, you can stop me. I think the national farmers union, in their testimony, referred to the Kefauver report of 1958 on prices in industry. A criterion which developed out of that inquiry referred to "administered prices" in the automobile industry. When we put these questions to witnesses, in the case of manufacturers of machines, they denied that this principle or criterion was being applied. What is your opinion of it?

Dr. MACFARLANE: May I say, Mr. Southam, that I am very glad you raised this, and I think I can assist the committee in some small respect here. An administered price, so far as the economist used the term—and the national farmers union was quoting it in its proper context—is a price in any industry where there are not erratic fluctuations dependent on supply and demand—the kind of thing which you have in agriculture, or that you certainly had in agriculture before we had supports and everything else—and you still have it. In an industry with thousands of firms and rapid fluctuations in prices almost day by day if not hour by hour, it is certainly a competitive price and not an administered price. Then, when you get into an industry with half a dozen dominating firms, you do not find these rapid fluctuations in supply in response to demand. In the case of an industry, I take it the published price books are good for perhaps six months or a year. In my thinking, this would have to fall under the category of an administered price. When I say that, I do not mean it has anything to do with collusion between companies or a combine at all. It is merely stating a fact that an industry is made up of a small number of firms where you do not have an opportunity for erratic fluctuations in price, and you call that, or your economist calls it, an administered price. If the machine companies deny they are administering, I think they are denying any implications that there is anything like a combine; but with an administered price it can be or should be or almost always is outside entirely of any context of a price combine.

Mr. SOUTHAM: Is this in relation to the principle you espoused here a few moments ago, that you were referring to factors affecting prices other than the basic cost of steel, transportation, and so on. You more or less interpreted that by saying the companies were inclined to load it with all that the traffic could bear. Is there any relation here to that?

Dr. MACFARLANE: I would not say there is any relationship between that kind of person trying to get everything he can get and what is called an administered price.

Mr. SOUTHAM: There is one other question. It may be that this has been discussed while I was absent. We have talked about, in relation to farm machinery, the question of planned obsolescence. I realize that in order to have some progress in farm machinery, the same as in everything else, you cannot continue making the same unit year after year; but a finger has been pointed by the farmers union, that the companies had planned obsolescence, which would work in a lot of instances to the detriment of the farmer. What is your observation in relation to that?

Dr. MACFARLANE: I would say when they put fancy tinplate on something, there must be some kind of inspiration, and you can call it planned obsolescence if you wish. There is some hope, by getting the tinplate on, that you are going to attract somebody, and that the model will be out of date when you have that little bit of tinplate in a different place two years from now. Therefore you would think there is something like planned obsolescence.

The denial of this is in the fact that farm machines are used for a longer period as time goes by. Tractors now last three or four years longer than they did before world war II. Therefore, if there is any kind of obsolescence it does not show up in terms of the length of productive life of these machines. It is being extended and at a pretty fast rate. For this reason, while I suggest that there is in the minds of manufacturers some ideas of planned obsolescence, in the same way that you have it in the motor car industry, I would say that, because of the longer life of farm machinery, planned obsolescence has no bearing on the productive work done by a tractor. This is going on and expanding and increasing as the years go by.

Mr. SOUTHAM: As you say, we did find very strong evidence of that in recent years. I remember this in the case of the automobile which was costing \$3,000 and which went up to \$4,000 and \$5,000 and changes were made by a longer wheelbase, more tail fins and the use of various gadgets. As a result, the automobile industry priced these cars out of the market. Consequently, the market was infiltrated through the importation of European cars. This had an adverse effect on the American automobile industry. I wonder if that same principle has been injected into the farm machinery industry. If so, it would mean that the farmer was paying part of this cost.

Dr. MACFARLANE: I think there have been attempts in that direction, but I do not attach much importance to them.

Mr. MCINTOSH: You said that in your opinion the retail price asked for any one particular piece of farm machinery had no bearing whatsoever on the cost of it. Was that a correct statement?

Dr. MACFARLANE: That is a little more extreme than I put it. To the extent that prices are made up of cost factors on the one hand and demand factors on the other hand, the demand factors are far more important than the cost factors. This is another way of saying that the machinery companies would try to maximize profits over some target period.

Mr. MCINTOSH: You have arrived at that period from your extensive study of this problem, I presume. I was wondering if in your study you were ever consulted by any of the companies from whom we have had briefs here?

Dr. MACFARLANE: I have talked to lots of them. I have not talked to any of them about any single statement which goes into this brief.

Mr. MCINTOSH: Have you provided any material, sir, for Massey-Harris?

Dr. MACFARLANE: I have.

Mr. MCINTOSH: What part of that material did you supply?

Dr. MACFARLANE: It would be hard to say. The Massey-Ferguson brief is 95 per cent the work of the officers of that company, and 5 per cent my inspiration, but not my material.

Mr. MCINTOSH: What do you mean by your "inspiration"?

Dr. MACFARLANE: Holding their hand, guiding their hand, on the preparation of the statement for this committee. I would not and did not—and Massey-Ferguson would not—talk to me about anything that was going in here.

Mr. MCINTOSH: In view of all the figures that were in that brief, would your study of that brief—presume you have seen it—be the basis, possibly, for your making the statement that these machine companies stand what the traffic will bear?

Dr. MACFARLANE: That view which I have, that the machine companies will price these machines to get what the traffic can bear, has nothing to do with any contacts I have had with the farm machinery industry. It has nothing to do with the industry itself. It is, I take it, a basic principle in our kind of economy, that anybody will price their product to get the most they can. This has nothing to do with one industry. It is a very general rule.

Mr. MCINTOSH: I presume you were here when they were presenting their brief. You saw the graphs which some of these companies presented to us. I think the intention of the witness at that time was to show us that the increase in farm machinery prices had not been as great as the increase in their cost factor over a certain period of years, that if it were based on cost, which we presume it has been, the retail price to the farmer should have gone up considerably more than it has.

Dr. MACFARLANE: Well, anybody may have presented that kind of data, but I do not think I could find that. I gave these supplementary statements this morning, this table of rolling mills, rubber and so on. I think that the price of farm machinery has risen pretty much in line with the production components, including labour; but if it has, this is coincidental, and it has meant that the best they could do in the market yielded them a price which happened to bear a certain relationship to the cost factor.

Mr. McINTOSH: If I can remember correctly, in one brief they said the labour costs had increased 98 per cent, the cost of raw materials had increased—does anyone remember the figures in that brief—by 57 per cent—and the retail price had only increased by a much lower cost factor.

Dr. MACFARLANE: This can be true for an individual implement. I do not see how it can be true for industry prices.

Mr. McINTOSH: It was for one firm.

Dr. MACFARLANE: I could not speak to it. I am sorry. I make a general statement and that is the one which I have filed with the committee this morning.

The VICE-CHAIRMAN (*Mr. Smallwood*): We have been sitting now for over two hours, and I see by a statement a few minutes ago that we have covered some of Mr. MacFarlane's inspirations in the Massey-Ferguson brief. You have spent quite a while, today, considering this, so I expect we should adjourn within the next few minutes.

Mr. HORNER (*Acadia*): On page 67 you interlink the relations between farm income and farm sales. Have you any knowledge of the realized net income statement which D.B.S. put out? You realize how they arrive at the net income statement?

Dr. MACFARLANE: I do.

Mr. HORNER (*Acadia*): Before arriving at the net income statement, they produce a realized net income statement. Do you not think that a realized net income statement would have been a better one to use, rather than the plain net income—because after all a person does not gain any purchasing power really from a paper gain which could come about by the changes in value of inventory—say, for capital, or something, which is held over. Do you realize what I am getting at?

Dr. MACFARLANE: I do.

Mr. HORNER (*Acadia*): You agree that realized net income would perhaps have been a better table to use in the comparison?

Dr. MACFARLANE: I think it is pretty much a toss-up. I am not going to agree. The two are not too far apart during the years.

Mr. HORNER (*Acadia*): It might be interesting for you to look at them and see how far apart they are.

The VICE-CHAIRMAN (*Mr. Smallwood*): Thank you, Dr. MacFarlane, for your presentation. Our next meeting will be at 9.30 on Monday morning next, when we will have the Cockshutt company.

I. PREFACE

1. The real course of the history of the world in contrast to the records of wars, of intrigues, of the pomp of courts, of the adventures of kings, and of diplomatic blunders is concerned with the progress and setbacks of the masses of the human family. This history which relates the story of the intellectual, social, and constitutional progress is very largely concerned with the fact that the great majority of all men over all time have been bound in drudgery to the land. Only in the past one hundred years with adaptation of the machine to agriculture has the heavy burden of manual toil been taken from the shoulders of the farmer. In advanced countries, where productivity gains in agriculture have far outrun population growth, the proportion of the working force required to meet the needs for food and fibre has declined from 70 to 80 per cent of the total labour force one hundred years ago to a level of 15 per cent or less today. This in itself made possible the rise of the great industrialized nations.

2. But in the course of achieving great advances in productivity while financial returns to farmers have risen, roughly doubling over each of the past five generations, they have persistently lagged behind those of workers in non-agricultural pursuits. In addition, returns to farmers have been subject to much wider cyclical sweeps. It is a blunt fact that capitalist economies have not provided "fair shares" to an important capital owning class—the farmer. This explains why the economic problems of the farmer have so frequently become

political problems. I believe that it is proper that the farmers' economic difficulties have become political issues. Governments frustrated by the failure of direct attacks on the farm income problem unavoidably turn to examining the possibility of indirect efforts to improve farm incomes. Thus the House of Commons Committee on Agriculture and Colonization is currently examining the prices of farm machinery. This, too, is proper. It is hoped that this modest submission which is concerned with the relation between the economic organization of the agricultural machinery industry and the progress of agriculture will be of some assistance to the Committee.

3. The paper deals at length with the horrible realities of the fact that agriculture is a declining industry. Workers in such industries are, under an enterprise system, necessarily subjected to the rigours of being forced through sweeping changes—and these occur in the context of secular decline in incomes. Such circumstances represent grave problems not only for the farmers involved, but for their elected representatives.

4. The present paper follows in the tradition established by two earlier Canadian economic studies of the agricultural machinery industry.¹ To a very considerable extent the present work brings up to the current period the analysis undertaken in these earlier and valuable studies. The extent to which it departs in subject or emphasis from the approach of those studies reflects the author's views of the particular interests of the Committee as revealed in its 1960 hearings. However, the present paper is concerned only with the economic aspects of the problem.

II. INTRODUCTION

A. General Historical Background

5. To examine the position and problems of the Canadian farm machinery industry over the post-war period it is necessary briefly to review historical developments that bear particularly on the structure of the industry in this period. The reference to historical considerations is no more than a recognition of the fact that in its present position every industry necessarily reflects its historic origins and development. These matters have been developed at length in the two publications referred to earlier so that the present review may be very brief.

6. The industrial revolution of the late 18th and of the 19th centuries represented the means by which very large numbers of workers shifted out of agricultural employment and took up work in factories and in commercial pursuits. It would follow then that an agricultural revolution preceded the industrial revolution—and *this was the sequence*. This process began with the introduction of new and improved crops, with cultural practices, and with changes in the economic organization of the farm industry. The rapid substitution of the horse for human labour was an important factor. It was possible to effect a vast transfer of workers from farms to factories only with large gains in the productivity of agricultural workers. Thus the stimulus to replace hand work by the horse and machine in farming. This arose just as much from the desire to achieve greater efficiency and profits from farming, as it was forced by the attraction of work opportunities in manufacturing industries and in commerce.

¹ J. D. Woods & Gordon Limited, *The Canadian Agricultural Machinery Industry*, Royal Commission on Canada's Economic Prospects, Ottawa, 1956, The Queen's Printer; and W. G. Phillips, *The Agricultural Implement Industry in Canada*, Toronto, 1956, the University of Toronto Press.

7. While hundreds of patents on agricultural machinery had been taken out in the preceding 50 years, it is generally agreed that the modern farm machinery industry had its beginning in the 1840's with large scale production based on two inventions of the previous decade. Here we refer to the mechanical reaper of Cyrus McCormick and to the steel mouldboard plow of John Deere. The following 50 years were characterized not only by an almost continuous burst of inventions and by the development of large scale efficient plants, but by almost ceaseless patent conflicts, generally described as patent wars. While there were many companies in the field most of them had of necessity to operate largely as patent licencees. But in the last two decades of the 19th century with a sharp decline in farm incomes most of the firms in the industry failed and a small number of companies emerged as leaders in the field—their strength depending largely on their ability to finance research and development. However, consolidation of the industry was clearly aided by the marketing advantages of firms which could offer a wide range of farm implements and which were in a position to pursue sales aggressively. These developments coincided, of course, with the mature agricultural development of the vast wheat areas of the Great Plains. The 40 to 50 years prior to 1929 are described as a period of broad expansion during which the production of farm machinery became one of the leading industries of North America.¹

B. Canadian Background

8. Throughout the 1840's, during which commercial agriculture had its beginnings in Canada, and for two decades following, Eastern Canada was largely isolated from the United States because of the limitation of transportation facilities. Thus, there developed in Canada an indigenous farm implement industry. This was aided by the imposition of 10 to 12½ per cent tariffs in 1847 in United Canada. It is stated that "by the mid-sixties, Canadian firms were virtually in possession of the Canadian market . . ."²

9. However, this control of the Canadian market depended very largely on leasing of patents owned by individuals and companies in the United States. The decades of the 1850's with the Crimean War and the 1860's with the American Civil War provided strong encouragement for the Canadian farm machinery industry both by expanding the demand for agricultural exports and by restraining the force of competition from American manufacturers. This was aided by a tariff increase to 20 per cent in 1856. While there was no strong agreed view in the industry favouring further protection, duties were raised to 25 per cent in 1879 and further to 35 per cent in 1883. These tariff changes reflected rather the determination of the government to guarantee the domestic market to Canadian secondary manufacturing industries whether they needed a tariff or not. (See Phillips p. 42) The first important American response to high Canadian tariffs came in 1900 when the Deering Company established a plant in Hamilton, Ontario which became the location of the present large Canadian operations of the International Harvester Company.

10. With opening of the Canadian West in the 1880's it became evident that competition from the United States in the great Prairie farm machinery market would become an important factor. This was due to the fact that unlike Canada, the American industry was able to move west with the farming industry. This was in large part attributable to the fact that Chicago, in the heart of the American agricultural region, became an important steel centre before the turn of the 20th century. Thus in that country there has been a strong tendency for steel using industries to agglomerate in the Chicago area. The issue of steel using industries locating in Western Canada has, of course,

¹ See J. D. Woods and Gordon Limited, *op. cit.*, pp. 2-3.

² W. G. Phillips, *op. cit.*, p. 10.

been raised many times. But only in recent years when an economic fuel became available through natural gas has one of the great barriers been removed. The other, availability of raw materials for the steel industry, remains.

11. The first census in 1861 listed 46 agricultural implement companies in Canada with combined sales of \$413,000. However, the expansion of the next decade was rapid and by 1871 there were 252 in operation with sales of 2.7 million dollars. Beginning about 1885 a move toward mergers of the large number of independent companies began. Two of the largest, A. Harris, Son & Company, and the Massey Manufacturing Company merged in 1891 giving them about one-half of the agricultural machinery output in Canada. The Cockshutt Plow Company merged with Frost and Wood in 1909 and in 1912 purchased the Brantford Carriage Limited and Adams Wagon Company. Massey, International and Cockshutt clearly became the "Big Three" of the industry. However, in 1911 John Deere acquired a plant in Welland, Ontario, but in comparative terms this remains a fairly small operation. As in the United States the merger movement of this period had the purpose of giving the opportunity to sell full lines or nearly full lines of agricultural machinery. It is interesting that at the present time there are only about 70 agricultural machinery companies operating in Canada, only four of them are of importance in terms of volume of output, having annual sales in excess of five million dollars. Most of the smaller companies are producing specialized types of equipment such as rod weeders, land rollers, spray equipment, dairy equipment, etc.

12. With the drastic decline of farm income in the 1930's the market for new agricultural machinery both in Canada and in export sales all but disappeared. Thus, the Woods-Gordon report indicates that in 1933 production of Canadian agricultural machinery amounted to only 12 per cent of that of 1928. Agricultural incomes recovered slowly during the 1930's, with the result that the agricultural machinery industry remained in a seriously depressed condition. During the war with the rationing of materials and control of manpower, the industry was denied an opportunity to expand output freely even though the market existed. However, during that period the industry did get substantial work on government contracts and was able to rehabilitate its equipment and buildings, thus getting into a stronger position to meet the pent-up demands at the end of the war. The present paper gives particular attention to this post-war period. The most important wartime development for the industry was the removal of all tariffs on agricultural machinery in 1944.

C. Canadian Exports

13. It is interesting that in the year 1887 two of the large Canadian farm machinery producers undertook to develop export markets for their products. Distribution and service facilities were established in the United Kingdom, in many other countries of the British Empire, and in most of the continental European countries, including Russia. Apparently this decision was undertaken in an effort to secure a volume of production with which it would be possible to realize economies of large scale operations. It is interesting that this move to secure an export market came at a time when the Canadian farm machinery industry had a high protective tariff which almost guaranteed the entire Canadian market to domestic manufacturers.

14. The exports of Canadian agricultural machines in the first two or three decades after 1887 were not particularly large; however it does appear that these sales were profitable and came to occupy an important place in the economy of the Canadian industry.

15. A major factor in permitting successful exploitation of European and other markets abroad rested in the rapid industrialization of these countries. This industrialization on the one hand was depriving agriculture of the labour required for food production and on the other was resulting in increased costs of agricultural labour.

16. The pattern of exports of Canadian agricultural machinery would naturally change in 1913 when the United States removed all tariffs on farm machinery. Canadian based firms were given a limited opportunity to integrate their operations on a North American basis. While this fact opened up a vast market for Canadian based manufacturing operations, it was very difficult for Canadian companies to compete in the United States with the well established full line American based companies. By 1920 Canadian exports to the United States reached 3.4 million dollars or 29 per cent of all exports. Only over the post-World War II period have exports to the United States become of great importance. The removal of the last duties on agricultural machinery entering Canada in 1944 virtually forced the industry on both sides of the border to integrate their operations into the realities of a continental market. However, the burst of post-war exports to the United States was in part attributable to the fact that one Canadian manufacturer had a lead over all machinery companies in having a good self-propelled combine. These exports reached a point of 106 million dollars in 1951 and since have levelled off at 70 to 90 million dollars. While exports to the United States were expanding after World War II, Canadian exports to other countries were sharply reduced. This arose from the phenomenal recovery of European industry and from trade restrictions which accompanied the dollar shortage. Confronted with these circumstances, North American companies expanded production abroad.

III. THE CANADIAN AGRICULTURAL MACHINERY INDUSTRY, 1947-1958

A. General Review

17. The striking growth of Canadian secondary manufacturing industry over the post-war period is set out in Table I. The data respecting the performance of the agricultural implements industry over these years may convey to Committee members as much of a shock as they did to the writer. The expansion of output of agricultural machinery over this period is only about one-third as great as that for other secondary manufacturing industries. To account for this very slow growth is clearly a task for the economist, and a difficult task. We proceed to that job in this section of our presentation.

18. The basic statistics for the agricultural machinery industry are presented in Table II. (Warning should be given that the data on gross selling value of products over this period of years is not strictly comparable since the Dominion Bureau of Statistics changed its method of deriving this figure. However, this does not detract from the general usefulness of these data.) The dollar values in the Table should be considered in the context of the inflationary forces which have operated in the Canadian economy over the years recorded. Further, as noted earlier, the physical volume of output has declined by 41 per cent since 1949. The data also reveal the decline in sales after 1952, this being related largely to the decline in net farm income. However, since 1954 there has been a measure of stability with respect to total production. This stability may be expected to continue because of the necessity of replacing equipment purchased

TABLE I
SECONDARY INDUSTRY, PHYSICAL VOLUME OF OUTPUT, 1935-1959
1949=100

	Agricultural Implements	Primary Iron and Steel	Iron and Steel Prod.	Motor Vehicles	Electrical Apparatus	Petroleum and Coal
1935.....	19.7	27.6	29.2	48.9	22.9	37.8

SOURCE: *The Agricultural Implements Industry*, D.B.S., Various Numbers.

after the end of the war. The industry will also, in the view of many economists, continue to have a stable to rising character because of the many opportunities which farmers still have to profitably invest in farm machinery.

19. In keeping with the 41 per cent decline in output since 1949, numbers of production workers have been decreased by 40 per cent, while the number of salaried workers has been decreased by 17 per cent. No similar adjustment in outlays on wages and salaries is evident since earnings per worker in both of these categories rose sharply over the period since 1949. Before proceeding from this general review of the agricultural machinery industry, attention is drawn to Table IIA which sets out several series of data relating to the industry. These cover the retail prices of agricultural machinery, indexes of important purchased components and of related or comparable items, as well as an index of hourly earnings of agricultural machinery production workers. These will be referred to in the following sections of this statement.

B. An Integrated North American Industry

The idea that integration of manufacturing and sales operations on a North American basis was encouraged or "forced" by the Canadian removal of tariffs on farm machinery in 1944 has been introduced.

TABLE IIA
PRICES AND OTHER FACTORS RELEVANT TO THE AGRICULTURAL
MACHINERY INDUSTRY, 1947-60

Year	Retail Price Index Farm Machinery	Average Hourly Earnings of Agricultural Machinery Canada	Wholesale Price Indexes			
			Rolling Mill Products	Rubber and its Products	Pig Iron	Hardware
	1949=100	Current \$	1949=100	1949=100	1949=100	1949=100

SOURCE: Dominion Bureau of Statistics.

21. The extent to which the agricultural machinery industry has become fully oriented in an economic sense to the continental significance of its market is reflected in the accompanying Figures I and II. The first of these shows that over the period since 1947 some 60 per cent of all Canadian production of agricultural machinery has been exported. The second Figure reveals that over the period since 1947 more than three-fourths of sales of agricultural machinery in Canada is represented by imports. Here obviously is a situation of a highly developed state of integration of the industry on a continental basis. The extent of integration of this industry on a continental basis is indicated by the fact that almost all of the tractors used on Canadian farms are imported, while a large proportion of the combines produced in Canada is exported. The same is true of balers, of mowing machines, of drills and of cultivators.

22. One of the major difficulties which prevents the more complete integration involving full specialization within plants lies in the fact that the

major production facilities in Canada are located in the Toronto-Hamilton area. Factories located in this area face serious transportation difficulties or costs in selling products beyond the Michigan-Indian border, or south of the Ohio River. It was estimated by Woods-Gordon that Canadian based factories had a transportation differential which favoured them in selling in only 26 per cent of the combined Canada-United States market in 1950-51 (p. 21). At the present time because of freight rate increases, the proportion of this total market which may be more advantageously served from the Canadian based plants has shrunk to about 15 per cent.

23. While the Canadian based factories are at a clear disadvantage so far as transportation costs are involved in serving by far the largest part of the continental market, these plants do have an apparent advantage in terms of labour costs. Hourly earnings in the United States agricultural machinery industry are about 27 per cent higher than those applicable to Canada. But the lower wages in Canada are more than offset by lower productivity of workers. This statement is based on Fullerton and Hampstead, which concludes that productivity of workers in the American farm machinery is clearly higher than Canada. They conclude that "in agricultural implements, despite the down trend in Canadian productivity in recent years, productivity per man hour on a value added basis is shown as some 32 per cent below the United States..."¹ This comparatively large differential would appear to reflect the fact that some Canadian production facilities are less specialized and efficient than those of the United States. These authors warn their readers that while the data they present are the best that can be secured on the basis of available basic statistics on the industry, that they cannot be considered to be particularly reliable, but they are useful, general guides. In summary, we might state that real labour costs in the two countries are about comparable. This leaves the Canadian based industry with a grave and increasingly difficult transportation disadvantage.

24. There are clear and substantial advantages to Canadian farmers in the tariff free situation which prevails for agricultural machinery. Not only do they secure free access to machinery produced for the very large American market, but they have access to Canadian produced machinery on more favourable terms than would otherwise prevail since the Canadian based plants can realize scale economies due, in turn, to their having access to the American market.

25. One of the most significant facts of Canada's post-war economic history is that the agricultural machinery industry has survived and grown, even though slowly, without the benefit of tariff protection. This does not guarantee the farmer machinery prices which bear a discernable relation to the prices of the products he sells. But it does assure him of machinery prices more favourable than would apply in a tariff situation where Canadian manufacturers were limited to the relatively small Canadian market.

26. When the economist is asked to propose measures which would restore competitive pricing to segments of the economy where monopolistic or non-competitive pricing is thought to prevail, his first answer runs in terms of giving access in the domestic market to the supplies of the producers of all countries. In its action in 1944 in removing all tariffs from agricultural machinery the Canadian Parliament did exactly this. To the credit of the United States, or rather to the credit of the political influence of American farmers, the United States took similar action in 1913. This action would go a long way in preventing non-competitive pricing practices.

¹ *Canadian Secondary Manufacturing Industry*, The Royal Commission on Canada's Economic Prospects, Ottawa, The Queen's Printer, 1957, p. 159.

27. In the agricultural machinery industry, rather than being confronted with the domestic industry "folding" in the view of the removal of tariffs, we observe rather that the industry has survived—not in a flourishing condition, but its survival is of very great significance to our country and to our farm industry burdened as it is by tariff barriers. The volume, *Canadian Commercial Policy*, prepared for the Royal Commission on Canada's Economic Prospects, assessed the cost of the tariff on Canadian consumers at approximately one billion dollars in 1956. This was in terms of an economy which at that time produced a gross national product of 30.6 billion dollars and a disposable income of 20.2 billion dollars.

28. Adjusting to the free trade situation has not been easy for the agricultural machinery industry. It has required geographical or regional specialization of production. Thus Canada produces very few farm tractors. On the other hand Canada has had a very large export of combines. What is suggested is that the free trade situation has led to production specialization which permits realizing the economies of large-scale production for various types of machines.

29. It is very interesting that the Royal Commission examining the Canadian automotive industry has been presented with the challenge of considering the economics of organizing the automotive industry in North America on exactly the same terms as those which apply in the agricultural machinery industry. In the latter, the customer is charged the same price in Canada as in the United States, transportation differentials considered. In the case of the automotive industry the differentials in the price of low priced standard cars in 1955 was 11 to 22 per cent.¹ Some of this is, of course, accounted for by differences in taxes. It is worth noting that in recent years imports of agricultural machinery came from many countries, and in significant quantities from four. Here is an illustration of comparative advantage at work. We observe that the Canadian farmer is given the benefit not only of the mass production techniques of the United States, but of the striking industrial achievements of Western European countries in the post-war period.

30. The benefits which farmers derive from free trade in farm machinery is illustrated by retail cost comparisons between Canada and the United States on other items. In 1955 corresponding electric ranges were priced from 12 to 54 per cent higher in Canada; automatic washers were from nine to 33 per cent higher in Canada; refrigerators were from four to 49 per cent higher; and television sets from one to 36 per cent higher.²

C. Pricing Policies in a Non-Competitive Industry

31. The economist's definition of competition requires, among other things, a large number of sellers—the kind of situation that exists in agriculture, and to a smaller extent in such business undertakings as the corner grocery store. In the economist's view the competitive situation is advantageous because its wholesome welfare implications stand out clearly. His analytical apparatus is adapted to such situations. When he is confronted with non-competitive situations he enters something of a guessing game or at least an area of study where consideration of appropriate strategy of business conduct becomes important. And even though the individual economist may (and sometimes does) excel in strategic situations, his machinery or formal analytical methods in this area are not particularly sharp.

32. This frank bearing of the economist's breast is, in effect, no more than stating the position credited by the National Farmers Union in its brief to this

¹ J. H. Young, *Canadian Commercial Policy*, Royal Commission on Canada's Economic Prospects, Ottawa, The Queen's Printer, p. 187.

² Young, *op. cit.*, p. 213-5.

Committee, to Dr. Gardiner Means of the U.S. Federal Trade Commission. He is reported to have stated "that while administered prices (those that do not fluctuate readily in response to supply and demand in the market) have become an essential part of our modern economy, we do not know enough about how they actually operate to be able to make good national policy in such economic fields as inflation, full employment and enforcement of competition." (p. 10)

33. Dr. Means, who is the recognized authority in the analysis of pricing policies in non-competitive industries has stated many times that in this area there is no unique answer to output and price policy. Actually the economist has formulated dozens of analytical models to help secure understanding of price and output policy in such industries. These models generally lack any substantial approach to reality due to the types of assumptions that must be made in order that any solution can emerge. And it is always extremely difficult to determine whether in any given industry or in any given firm the actual conduct of its affairs coincides approximately with any of the models that have been developed. Furthermore, as noted, no consideration of price and output policy in the non-competitive field is free of considerations of strategy. This much economists do agree. By strategy is meant for instance, the idea that firm A, one of the fairly small number of competitors in an industry, does not take a price and output decision simply by observing or guessing at the policies operating in firms B, C, D. . . . Rather A must take its own decision with regard to price and output in terms of an estimate of how firms B, C, D . . . might react to or might respond to any of the possible positions that might be adopted by firm A.

34. The individual agricultural machinery firm appears to determine its prices on individual machines by very complex and arbitrary procedures of testing for projected costs on the one hand and testing the prospective reception of the machine in the market on the other hand. This latter step is mainly concerned with assessing or appraising the competitive position of rival's comparable machines.

35. The procedures employed by the manufacturing industry in the United States are described by Professor W. A. Cromarty of the Michigan State University and it may be useful to quote this entire part of his report:

Production planning for machinery manufacturers tends to follow a pattern which is described briefly as follows: Long-range market forecasts, which represent average annual industry sales for the next decade or so, are prepared for each major implement. These estimates form a basis for long-range planning commitments and are largely used for tooling and facility planning.

Estimates for the forthcoming year of industry and company sales are made for each major implement. The latter estimates are probably the most crucial to the company since materials purchasing and tooling are planned on this basis. Adjustments in annual planned production may be made by reviewing the relation between current production and current sales. Although this may be done as often as monthly, longer term adjustments are preferred.

Production schedules are planned so as to have new implements in dealer hands just prior to the season when they are used on the farm. This requires planning in advance of any peak which may be reached for sales. The seasonal use of many farm machines often permits farmers to postpone decisions on purchasing until shortly before the machine is needed. They may even postpone purchases until the following year if crop prospects are not good and manufacturers must attempt to adjust production to such seasonal requirements. Many farm imple-

ments are used for only a few days per year and the required production volume to fill total demand is thus low.

Manufacturers attempt to adjust to this in two ways. Production schedules may be planned so that a very few types of machines are produced in large numbers for very short periods of time, to be followed by other types of machines. Such planning leads to efficient use of men and materials.

"The alternative is to not produce particular machines which have low-volume sales and to buy the complete machine or many of the constituent parts from smaller "short-line" companies who specialize in few machines.

Two methods of production are generally employed. The parts of more complicated farm machines, such as tractors, combines, etc. are produced for immediate assembly with repair parts being produced only in the quantities estimated to be necessary. For less complicated tillage implements, parts are manufactured for assembly at some later date, and in fact may be shipped to dealers in an unassembled or partially assembled form.

Production restrictions as outlined above, as well as those due to decreased demand and consequently lower sales volume, are important factors in pricing farm machinery. In addition, transportation charges, material prices, administrative and selling expenses, factory overhead, sales taxes, direct labor costs, and margins of retailers and manufacturers all contribute to the level of machinery prices.

Separating the effects of each of these charges is difficult. For instance, materials prices are generally overstated by manufacturers and labor costs underestimated due to their accounting methods. As raw materials are processed by subsequent departments in a company, labor costs are added to the original cost to give a new materials price. Therefore, the labour cost involved in processing is submerged in the transference.

Pricing policies in the farm machinery industry cannot be said to follow principles outlined in theoretical competitive economics except in a very indirect manner. In general, the method of arriving at prices of implements follows a three-step pattern. A first estimate of price is made on the basis of costs of materials, labor, and past profit. The first revision is made by comparing this figure with the prices of competitive implements. A final revision is made based on technological improvements and the level of sales.

"Costs used as a basis of selling are based on the estimated prices of materials during the coming season. This includes any adjustments in wages liable to become effective during the coming year. Factory overhead expenses are based on past experience and the expected volume of production.¹

36. Professor Cromarty, dealing with the importance of what he describes as market variables in influencing the price of farm machinery states the following:

The major market variables for the machinery sector include the price of steel, the level of industrial wages, and manufacturers shipment of machinery. The outlay on steel is one of the major costs of producing farm machinery and it is to be expected that machinery prices will be governed by variations in the price of steel. This applies to industrial wage rates too.²

¹ *The Demand for Farm Machinery and Tractors*, Michigan State University Technical Bulletin, 275, 1959, p. 29-31.

² Cromarty, *op. cit.*, p. 37.

37. A manufacturer may feel, like many farmers, that he should secure costs of production, and a going rate of return on capital. But he has learned, as the farmer has, that there is no assurance that he can get cost of production. To illustrate the grave limitations which attach to ideas that the price of the product should cover costs I can do no better than quote in full an editorial which I wrote for the *Macdonald Farm Journal* in March, 1958, as follows:

Perhaps the hardest among the perennials—should we say among the perennial weeds—is the idea that farmers should secure their cost of production. Of course any one would agree that they should secure prices which are equal to their costs. This would seem to be the most elementary expression of equity or justice.

The difficulty with the cost of production idea is that the mechanics of its calculation render the determination of any defensible single cost figure almost impossible. These calculations involve logical difficulties which no one has yet solved. But they also must face up to the fact that our type of economy does not operate to guarantee anyone cost of production. Granted, some groups in the economy are in the very favoured position so that they can extract from the purchasers full cost and then some. But the idea that any producer is entitled to cost of production runs strongly counter to the basic ideas of our competitive pricing system.

In the first place, costs of production of farm products derive in part from the price of the product. This is particularly true of those portions of cost which reflect land values or land rent, management, and even returns to labour. Thus, in a market in which the price of milk is favourable, land rents and land values tend to be high, and returns to labour and management tend to be high. What is particularly important here is that these costs reflect the level of prices to farmers, and in this sense are determined by prices.

Perhaps the greatest difficulty that is associated with the use of costs in price negotiation is represented in the fact that the costs of 'management' are not only important but difficult to handle. One might ask, 'What is the cost of management in producing milk for processing purposes?' It may be one dollar-per hundred pounds; it may be fifty cents; or it may be zero.

Farm cost studies, which are repeatedly made despite the logical difficulties which they involve, show a very wide range of costs as between farmers. Thus cost figures on one hundred dairy farms might vary from \$2.25 per hundredweight to \$5 per hundredweight. If costs are to be used as one factor in bargaining on prices one would ask immediately: whose costs?

The answer to this question is sometimes that the average cost should be used. But why should it? Why should one-half of the farm producers secure a price which fails to meet their costs? In establishing prices where a large number of individual producers are involved, control agencies have in the past used the idea that price should be set to cover the costs of 80 per cent of the producers. But why 80?

One might ask how labour costs are handled. Farm workers typically do not work for wages. Should a cost calculation use fifty cents an hour, or one dollar an hour, or just what figure?

The general rule by which production of any product is determined is that the price is set very largely by what consumers will bear. Granted, because of advertising and other such influences consumer preferences, or the strength of consumer demand, may not represent rational conduct,

but nonetheless it does represent market conduct. Perhaps the best that farmers or other producers can do is adjust to the forces in the market represented by demand. At any given time Canadian consumers might be willing to purchase 250 million pounds of evaporated milk at sixteen cents a can, but they would purchase only 150 million pounds at twenty cents per can. If, as suggested, this is the overriding force in determining where price will be, the best that producers can do is to adjust to it. This is rough, but it is the way of the market. And if this is the way of the market, then marketing boards and other such agencies are pretty much limited to assisting toward more efficient production and toward more efficient marketing.

The general impression one gets from the press is that farm production is inefficient and production in the processing and marketing field is efficient. Nothing could be further from the truth. While we have to face the overriding importance of consumer demand, it does not mean that we should look for improvements in efficiency only in farm production. We have to look at processing and marketing too.

38. While the foregoing statement relates to agricultural production it is not without an important bearing on any type of production. If one were writing with respect to the manufacturing industry, one would stress the fact that perhaps half of the costs incurred by the manufacturing company would have no bearing whatever on the price or output. Manufacturing companies have learned that once costs become fixed, they are sunk, and there is little or nothing that can be done about them. If the market allows the firm a sufficient return to cover these or more than cover them, well and good, but there is no way of requiring the market to remunerate firms for their fixed costs.

39. Financial statements of any type of company frequently show large "write-offs". These represent an accounting recognition of past "mistakes"; or to put the issue more fairly they represent the difference between a market projection made before the now fixed costs were incurred and the actual direction which the market has taken. In summarizing the whole burden of this discussion of fixed costs, we would assert that these have no bearing on current prices of farm machinery; on the other hand direct or variable costs do have such a bearing because it is still possible for the firm to change its outlays on these variable costs which are typically made up of wages, salaries, material purchased, etc.

40. In competitive industries prices are made automatically and confront the individual producer as a stark fact. In non-competitive industries the individual producer can choose the level at which to price an individual article. However, this freedom is very strongly circumscribed by the pricing policies of other firms. If one views the history of the agricultural machinery industry over 50 years, one would conclude that the freedom to establish prices at any level determined by the individual producer is a freedom to price your firm into a declining share or an expanding share of the market. Citing a University of Chicago study, we observe that by a burst of innovation genius and aggressive pricing the Ford Motor Company was able by 1923 to command 80 per cent of the U.S. tractor market. But this lasted for a very short period of years, and in 1929 Ford left the tractor market entirely.¹ All companies have had a very uneven experience in the amount of the market for any machine that they could hold over any period of years. It may be presumed that Ford did not choose to cut its share in the market or to leave the market. Rather, one would

¹ Conant, Michael, "Competition in the Farm Machinery Industry", *Journal of Business of the University of Chicago*, 26, 1953, p. 35.

judge that other manufacturers secured advantages in terms of research and development, in terms of costs, and in terms of assessing the nature of the market. These advantages were expressed in products and in pricing policies which allowed them to gain an increasing share in the market and presumably greater profits. This leads us to conclude that in a dynamic economy, even with a relatively small number of firms competing on a full-line basis, the important factors of research and development and of internal management have an extremely important bearing on the success of the individual company.

41. The demand for agricultural machinery is highly inelastic. Elasticity is a measure of response of amount taken in a given market to change in price. Dr. Zvi Griliches, in a recent study, shows the short-run elasticity of demand for tractors to be -0.25 over the period 1921-1927, excluding the war years.¹ Dr. Simon N. Whitney supports the proposition that the price elasticity of demand for farmers machinery is low, and cites a doctoral thesis in support of his view.² Professor Phillips (*op. cit.*) is less certain. However, he does conclude "it is, in fact, true that the same factors which account for high income elasticity of demand for implements likewise account for low price elasticity. Stocks of implements accumulated during high income periods, may make farmers quite indifferent to price changes in low income years. The greater productivity resulting from machinery improvements may be expected to mitigate the effect of price increases in recovery years, as should the increasing price of farm labour during those years." (p. 101-2).

42. Income elasticity as referred to by Phillips is the responsiveness of agricultural machinery purchases or demand to changes in the farmers' income. There is no disagreement on the high income elasticity in the literature on the subject. The relationship between these two elasticities as they bear on the farmer will be considered later. However, Dean V. W. Bladen of the University of Toronto reviewing the situation in the depression period, remarks that "it is doubtful, however, whether at any price at which they (Massey-Harris, International Harvester, and Cockshutt Plow) could operate that they could have sold machinery in the face of the decline in farm income".³ This is another way of stating the low price elasticity of demand and for agricultural machinery, and the high income elasticity of demand.

43. The problem of differential pricing in different countries by a single firm is not one which need cause concern. If a buyer's market existed in country A and a seller's market existed in country B, one would expect the same product to sell at different prices. All this means is that prices are to a large extent market oriented. At the same time one would expect the forces of competition among the 20 to 30 important agricultural machinery companies which operate on an international basis to dampen down any considerable price differentials. The literature on the industry leads one to feel that this type of competition exists.

D. The Question of Monopoly

44. Traditional or classic economics was concerned almost entirely with competitive conditions. The most important conditions required for the competitive situation are: (1) a large number of sellers; (2) each firm is operating under conditions of increasing unit cost; and (3) the demand curve for the individual firm must be horizontal indicating that price of the product is entirely independent of the output of the firm. Analysis conducted within this competitive framework yields a unique solution to price and output.

¹ "The Demand for a Durable Input: Farm Tractors in the United States, 1921-57", In Harberger, Arnold, *The Demand for Durable Goods*, University of Chicago Press, 1960, p. 205.

² *Antitrust Policy*, New York, 20th Century Fund, 1958, p. 252.

³ *In Monopoly and Competition and the Regulation*, London, MacMillan, 1954, p. 6.

45. In the latter part of the 19th century, and particularly because of the work of Professor Alfred Marshall of Cambridge, it became clear that a considerable part of the industrial complex of the United Kingdom operated under conditions which did not fit the assumptions imposed in classical economics. With the advance of technology and the growth of size of individual firms it was evident that the firms in many industries operated under conditions of decreasing rather than increasing costs, and had downward sloping individual demand curves. While Marshall made a considerable contribution to understanding these situations, particularly by introducing the idea of external economies, most pricing and output problems remained without a determinate solution.

46. Then in the late 1920's a burst of interest in the economics of non-competitive situations occurred and the names of Robertson, Clapham, Pigou, Sraffa, Shove, Mrs. Joan Robinson, and Edward Chamberlain became household words in the vocabulary of every student of economics. While the work of these analysts in the late 1920's and the early 1930's resulted in considerable advance in handling some problems involving the downward sloping demand curve for the firm, product differentiation, and the dependence of costs on demand, this whole decade of work has been described as little more than interesting exercises in geometry. Such is the nature of progress in economics.

47. Criticism of this work led economists to a new emphasis on defining institutional rather than analytical concepts. The result was the emergence of the idea of "workable competition". "Competition is workable in the sense (1) that it is preferable to the best alternative 'competitive' arrangement practically attainable; (2) that such market control as sellers can exert is slight and, under the particular circumstances does more good than harm."¹ The idea of workable competition was developed as a guide to courts in trying anti-trust cases and has been very useful.

48. Not only to advance analytical ideas, but again as assistance to the courts, economists devised a number of tests of monopolistic practices, which again have been used. These include (1) identical pricing; (2) price leadership; (3) sustained high level profits; (4) market sharing; (5) patent suppression; (6) basing point pricing; (7) an index of concentration. The agricultural machinery industry has been tested by all these measures. The only positive finding in the literature relates to price leadership. Quoting from Whitney who wrote in 1954: "The Federal Trade Commission found for the period before 1938 that International and Deere were definitely the price leaders . . . Such leadership by International and Deere was never invariable, and in recent years this price leadership seems to be no longer customary at all."² Justice Sanford of the United States Supreme Court, in a 1927 opinion in a case against the International Harvester Company, stated "price leadership was a natural, not a conspiratorial phenomena."³ This position is widely accepted.

49. Dr. Whitney, Chief Economist for the Federal Trade Commission of the United States, summarizes his study of monopoly practices in the agricultural machinery industry in the following terms: "In brief the influence of the antitrust laws on this industry has been relatively slight compared with the dynamic effect of technological competition, which has resulted in considerable fluctuations in the shares of the market held by different companies and at the same time has led to mechanical improvements which have been among

¹ Stocking, George W., and Watkins, Myron W., *Monopoly and Free Enterprise*, Baltimore, Lord Baltimore Press, 1952, p. 97-8.

² Whitney, *op. cit.*, p. 251.

³ *Idem*, p. 233.

the principal contributors to the tremendous advance in agricultural production."¹ He asserts that his findings with respect to the agricultural machinery industry bear out the much quoted statement of Professor Joseph A. Schumpeter of Harvard University in one of the greatest books of this generation.

As soon as we go into details and inquire into the individual items in which progress was most conspicuous, the trail leads not to the doors of those firms that work under conditions of comparatively free competition but precisely to the doors of the large concerns—which, as in the case of agricultural machinery, also account for much of the progress in the competitive sector—and a shocking suspicion dawns upon us that big business may have had more to do with creating that standard of life than with keeping it down.²

50. Whitney cites as one of the best proofs of the comparative rivalry that exists in agricultural machinery, the increase in the number of full-line companies. In 1922 there were three, in 1948 there were eight. He reports that "the author of the most thorough economic analysis of the industry in recent years became so impressed with the fact that mergers had created rather than repressed competition that he adopted the title 'Competition Through Merger'".³

51. Referring to the dynamic quality of this industry, Mr. Whitney states that the grain binder was perhaps a product whose release from monopoly control the government was most anxious to secure its original antitrust suit; "but by the 1930's the combine had replaced the reaper, the binder and thresher alike. In 1918 International had 65 per cent of the grain binder sales and in 1937, 67 per cent of the small number still made; but its share of the 1937 market for combines, which had made the binder almost obsolete, was only 19 per cent."⁴

52. Mr. Michael Conant, addressing himself to the relationship between standardization and technological innovation makes the following statement:

In the farm-machinery industry there have been some definite efforts to avoid product differentiation. One of the leading functions of trade associations in the industry has been the standardization of products. The marketing of many sizes and styles of a given machine has been considered by the full-line firms to add more to costs than to revenues. Standardization policies have resulted in interchangeable linkage of machines of one firm to tractors of other firms, a mechanical feature demanded by farmers. It is doubtful that standardization policies have had great significance in farm-machinery marketing, since machines such as tractors, combines, corn-pickers, and pick-up balers, which make up a large minority of total sales, have been subject to such rapidly changing technology that standardization of them would be impossible.⁵

53. International Harvester was a pioneer in farm tractor production and by 1911 was the country's largest producer. It was followed by Rumely and by Hart Parr. "In 1917 Henry Ford introduced the first lightweight tractor, which sold for less than \$1,000. The successful acquisition by Ford Motor Company of 80 per cent of total tractor sales by 1923 demonstrated the interrelation of technology and price as weapons of market rivalry."⁶

¹ Whitney, *op. cit.*, p. 256.

² *Capitalism, Socialism, and Democracy*, Harper, New York, 3rd Ed., 1950, p. 82.

³ Whitney, *op. cit.*, p. 236.

⁴ *Idem*, p. 234.

⁵ *Competition in the Farm Machinery Industry*, *Journal of Business of the University of Chicago*, 26, 1953, p. 29.

⁶ Whitney, *op. cit.*, p. 35.

54. Cyrus McCormick ruefully admitted that the low price of the Ford tractor gave it the leading position in the tractor industry and helped to set the type for all tractors of that day.

55. Conant goes on to say: "Just as Ford became the largest tractor seller by a striking innovation, so it lost its market share by failing to make continuous improvements on the Fordson." (p. 35) Ford lost its share of the tractor market to a very considerable extent by the introduction by the International Harvester Company of the Farmall, the first all purpose tractor ever produced—a tractor not only designed to pull tillage and haying machines, but designed to pull cultivating tools through a growing field. This innovation meant that the horse could be replaced by the tractor for all types of field work and the increased use of the tractor made it a profitable acquisition in terms of cost. The next significant development in the tractor came by Allis-Chalmers in 1929. This same company introduced rubber tired tractors in 1934, and these were adapted the following year by other full-line firms. In the course of these developments Allis-Chalmers more than trebled its tractor sales. Conant states that the next major tractor development was in June, 1939, when the Ferguson principle was first marketed on a tractor in the United States. With Ferguson's invention of hydraulic controls this machine found immediate demand and in 1943, 30 per cent of all tractors sold in the United States of less than 30 horsepower were Ferguson manufactured.

56. The experience cited above with respect to tractors involving four firms in a competition spurred not only by price, but equally by innovation is suggestive of forces that are still operating in this industry today.

57. In the United States there are over one thousand manufacturers of agricultural machinery and in Canada about 70. As late as 1948 the eight full-line companies held 73.6 per cent of the domestic American market. This fact is revealed in Table III, which shows the changing importance of individual full-line firms over the previous 26 years. That there is lots of room for relatively small firms which do not qualify as full-line manufacturers is revealed in the fact that between 1940 and 1948 the share of the tractor market of seven identical full-line manufacturers dropped from 88 per cent to 72 per cent; and from 65 per cent to 50 per cent for other implements. These data are based on United States census tabulations. (Whitney, p. 237).

TABLE III

FARM MACHINERY: ESTIMATED SHARE OF FULL-LINE PRODUCERS IN DOMESTIC DOLLAR SALES, 1922-48¹

(per cent)

Dearborn Motors Corp.....	—	1.7	1.0	10.1

¹ From Whitney, *op.cit.*, p. 235.

58. Whitney also says: "The record of the industry in production and innovation has been outstanding, and on the whole profits have been moderate. Criticisms stem from those who object to an oligopoly structure in any industry". (p. 256) Anyone who examines Whitney's analysis of some 20 industries in terms of whether or not monopolistic practices interfere with the public weal will understand that he is no apologist for big business or for monopolistic abuses.

59. The role of patents as a restrictive device in the agricultural machinery industry may easily be exaggerated. For instance, Whitney (p. 244) states that out of 1,233 patents held by International Harvester in the year 1946, 1,193 had been released to other agricultural machinery producers. Freedom of entry into the parts business is indicated by the fact that out of the hundreds of thousands of parts for agricultural machinery which are currently stocked and sold, no more than two to three per cent are protected either by patent or by royalty. In this sense there is almost free access to the parts manufacturing business. While this disposes of the argument that any particular agricultural machinery manufacturer has a monopoly with respect to parts, it does not get parts to the farmer at much lower prices. One would judge that the engineering, tooling, production, and distribution of parts by firms outside the industry cannot be achieved at prices to farmers generally as low as those charged by the manufacturers who have a responsibility to supply parts for at least a ten year period.

60. It is interesting that the United States Supreme Court in a 1927 decision respecting the charge of monopolistic practices brought against the International Harvester stated the following:

The law . . . does not make the mere size of a corporation, however impressive, or the existence of unexerted power on its part, an offence, when unaccompanied by unlawful conduct in the exercise of power . . . the fact that competitors may see proper, in the exercise of their own judgement, to follow the prices of another manufacturer does not establish any suppression of competition nor show any sinister domination.¹

61. This finding by the United States Supreme Court draws a sharp distinction between mere size of a corporation as evidence of an undesirable monopoly power, on the one hand, and the use of practices within the trade that may be considered clearly against the public interest. Thus the Supreme Court is stating in effect that until conspiracy or collusion is proven an individual firm cannot be convicted under antitrust legislation. This seems to be the situation that prevails in Canada, if the writer might advance a highly unprofessional view. Commenting on Canadian anti-combines legislation, Mr. D. Gordon Blair, an Ottawa lawyer, states:

Under modern conditions, it is plain that competition does not depend for its existence upon a large number of small competing units. The big three in the automobile industry may compete much more vigorously than any number of retail druggists in a community. It is recognized that competition can be expressed in many forms besides simple price rivalry among suppliers of identical commodities. There is the competition of substitutes, the competition of innovations and the competition of service, all of which have given strength and vigor to our economy, and in all of which price competition itself finds in part its modern expression. The competition it is the present policy of the law to defend and protect embraces all possible varieties.²

² *Combines, Control, or Competition? The Canadian Bar Review*, 31, 10, December, 1953, p. 1114.

E. Labour Productivity in the Agricultural Machinery Industry

62. The following statement, particularly in its economic definition and formulation, will depend to a major extent on a recent book which represents contributions by seven of the most outstanding labour economists and of the Secretary of Labour of the United States.¹ In this work the term productivity is defined as the ratio of output to any or all of the inputs used in production.

63. In this volume Professor Albert Rees of the University of Chicago states:

It is now generally well realized that output per man-hour does not necessarily reflect the contribution of production workers to changes in efficiency. It can rise because production workers work harder or are more skilled. However, it can also rise because more capital or more non-production workers are used per production worker. It can rise because of the improved quality of purchased materials or because of an increase in the ratio of purchased materials to final output. And, most likely of all, it can rise because of technological change.

Depending on its source, a gain in output per man-hour may or may not imply that real wages should rise. In general, we expect that in the sectors of the economy where output per man-hour rises least rapidly, wages will outstrip this measure of productivity, so that they will stay roughly in line with wages for workers of equal skill elsewhere in the economy. Where output per man-hour rises most rapidly, we expect wages to lag behind it. Some of the productivity gain will go into lower relative prices, and thus be shared with the consumers of the product.²

64. These points are made here not only because of their bearing on the statistical analysis which follows, but also to clarify the economist's position in the face of contrary views frequently expressed by organized labour in wage bargaining.

65. Dr. John W. Kendrick states in the same volume that the most commonly used measure is output per man hour. He writes that such a "partial productivity ratio does not indicate changes in the efficiency of the particular input, nor (sic) of the productive process generally" (p. 40). A partial productivity ratio in this sense represents a residual productivity to a single factor after other factors have been credited with productivity corresponding to their prices in the market. Kendrick states that "economies in the use of an input may result from increasing efficiency of production generally, or it may reflect changing proportions of inputs (resulting from changes in technology or the relative prices of the inputs). In the latter case, the use of one input per unit of output may be reduced merely because the use of another input is increased. For example, installation of new automated equipment may reduce the need for machine tenders and other production workers per unit of output, but the requirements for maintenance workers may go up as does the value of equipment used in constant prices. In other words, maintenance workers and capital have been substituted for production workers" (p. 40).

66. Partial productivity measures have general validity when labour costs represent a high proportion of value added in the production process. Their validity drops as the labour factor becomes less important in the production process. In the agricultural machinery industry in Canada over recent years the earnings of production workers have accounted for about 20 per cent of

¹ Myers, Charles A. (Ed.), *Wages, Prices, Profits, and Productivity*, The American Assembly Columbia University, New York, 1959.

² Myers, *op. cit.*, p. 21.

the value of final product. For this reason it is impossible to assert that the results arising from a partial imputation of output has any particular validity.

67. According to Dr. Kendrick (p. 40), increases in total productivity reflect primarily (1) technological progress; (2) economies of scale; and (3) more efficient rates of utilization of capacity. But he notes again at this point that changes in partial productivity ratios reflect factor substitutions in addition to the three variables listed. He goes on to state that the main element in the advance of productivity is technological innovation and points out that "research and development outlays have increased steadily in relation to sales for some decades, and so have the number of scientists and engineers as a proportion of the labour force" (p. 41). This would certainly be true of the agricultural machinery industry.

68. Respecting partial productivity measures he states that "unfortunately, these measures are popularly called indexes of 'labour productivity' but despite the connotation, they do not measure the efficiency of labour in the sense of the effort or skill of this factor alone. In fact, changes in labour efficiency as such have probably had a minor influence on changes in productivity" (p. 41).

69. Dr. Kendrick goes on "since World War II there has been a distinct decline in the production workers as a proportion of all employees or persons engaged in manufacturing. Since output results from the efforts of all persons engaged, output per production-worker has an upward bias as an efficiency measure" (p. 42).

70. In the case of Canada it is impossible satisfactorily to work through even a partial imputation of labour productivity for the reason that we do not have data on capital assets used in the industry—these being needed if we were to perform this task. If we assume value of capital invested in the agricultural machinery industry in Canada today is 125 million dollars (it was 103 million dollars in 1929 and 58 million in 1939, the last data available) then with ten per cent before taxes as the cost of capital and an annual depreciation rate of $7\frac{1}{2}$ per cent, the annual capital charge for using these resources would be approximately 21 million dollars. In addition to this it requires about 12 million dollars to cover the cost of salaries. Out of a 60 million dollars value added figure we would make an imputation of about 27 million dollars as the contribution of production workers. This exceeds somewhat the total wage payments in the industry.

71. The foregoing paragraph represents a very rough illustration of what is involved in imputing labour productivity in this industry based on the present level of output. It is not suggested that the figures have any real quantitative significance. But they serve the purpose of showing that it is necessary to take account of capital cost, and thus not impute to labour the share properly ascribable to capital. This is frequently done when partial productivity measures are used.

72. Figure III presents data which accounts for the distribution of the industry's gross selling value between the factors that are employed. These data are presented as three year averages for 1947-49 and 1956-58—this being done to overcome the discrepancies which would arise in using annual data. There is considerable variability from year to year in these data. The only significant difference in shares over the period has been in salaries and in overhead and profit. The former has risen, very likely due to the increase in the numbers of engineers and technicians employed as the industry moved toward automation and as it expanded its research programme. Further, as Dr. Kendrick noted,

automation requires a substitution of salaried control and managerial employees for production workers. The other category, overhead (taxes, interest, depreciation, etc.) and profits declined as a share of gross industry output over the period.

FIGURE III: THE AGRICULTURAL MACHINERY INDUSTRY, SHARES IN TOTAL OUTPUT, 1947—49 AND 1956—58

73. Over the period since 1947 the output of the industry has declined severely, with output in recent years running at about one-half of the level of 1949. This fact is shown in Figure IV. Over the same period, as noted, the number of production workers declined by 40 per cent and salaried workers by 17 per cent.

74. Finally on the matter of labour productivity, as we have already noted (p. 17), productivity in the Canadian agricultural machinery industry was computed for the Royal Commission on Canada's Economic Prospects at 32 per cent less than that of workers in the United States industry. This more than offsets the wage differential of 27 per cent favouring American workers. It would seem apparent that the Canadian industry has lagged behind that of the United States in modernizing manufacturing facilities. Increased labour productivity would seem urgently required if the Canadian industry is to maintain and expand its share of the American market for farm machinery.

FIGURE IV: CANADIAN AGRICULTURAL MACHINERY INDUSTRY, PHYSICAL VOLUME OF OUTPUT, AND NUMBERS OF WORKERS. 1947 — 1958

F. Marketing and Distribution

75. For an analysis of one of the most important aspects of the production and sale of agricultural machinery, we are virtually without data. We refer, of course, to the marketing and distribution aspects of the industry. In view of the interest in this subject, your Committee might very well consider recommending that the Dominion Bureau of Statistics collect information on this subject.

76. One of the major changes that has occurred over the war and post-war years has been the shift from an agency or consignment basis of selling to a dealership basis. This change has involved a very substantial reduction in the number of retail outlets, and the corresponding increase in the services rendered by the dealer. This has been particularly notable with respect to the numbers of parts stocked by dealers and with respect to making available comprehensive repair service facilities. This has, of course, meant that farm machinery dealerships have become fairly highly capitalized businesses.

77. The only public information available on distribution costs to the knowledge of the present writer is that which was reported to this Committee by the Canadian Federation of Farm Equipment Dealers. This organization stated that the gross margin of the farm machinery dealer was 18.67 per cent (p. 19 of brief). While the matter is not clear, it seems that this figure may

not include freight charges paid by the dealer. If so, it would seem that the total distribution margin might approach 25 per cent.

78. However, such gross margins are generally calculated as the difference between the price, exfactory, and the suggested retail price. It is well known that by cash discounts, inflated trade-in values, and other pricing devices that marketing margins computed as above are not realized in today's buyers' market. To this extent the Dominion Bureau of Statistics index which shows a 101 per cent increase in the price of agricultural machinery since 1947 is somewhat unrealistic, since it is computed from data provided by manufacturers, in contrast to representing actual transactions. The United States Department of Agriculture in its retail prices series secures the data from dealers. In that country retail prices have increased by 21 per cent between 1952 and 1959; in Canada the corresponding increase is 27 per cent. The actual increases paid by farmers over this period of years in Canada may be considered to have been about comparable to those which occurred in the United States. The Canadian data tend to overstate actual price increases in Canada in the sense that trade-in machines have risen with the trend in agricultural machinery prices. Thus the net outlay to a farmer in the purchase of a new machine has not risen as much as is suggested by the index. Farmers also make an adjustment to the rising price of farm machinery by reconditioning and repairing used machinery. Thus Professor Cromarty in referring to periods of low farm income states that "the dealers interviewed said that the turnover of used machinery was faster. Also, less of it reached the scrap pile."¹

G. Profits

79. Respecting the profits of the American agricultural machinery industry, Whitney states: "From 1947 through 1952 (which most people in the industry would describe as their golden age) the return on net worth of large agricultural implement companies (ranging between ten and 12 in number) averaged 13.2 per cent and from 1953 to 1955, 7.5 per cent—as against a more stable 15.5 and 14.2 per cent for more than 1,500 manufacturing concerns."²

80. The Woods-Gordon report on the Canadian agricultural implements industry sets out in exhibit 4, page 41, The Sales, Capital and Surplus, Funded Debt, Profit Before Taxes, and Net Profit After Taxes for four major implement companies which have factories in Canada. These are on a consolidated basis for all the operations of the companies and do not refer to Canadian operations alone. These data covered selected years from 1939 to 1955. Table IV brings up to date the financial data presented in the Woods-Gordon Report. It is regrettable that comparable data are not available continuously since 1947. However, the tabulations for the Woods-Gordon Report were adapted for that Commission and it would have occasioned more time than was available to have the Companies prepare such a continuous series. As will be noted from the data in these tables, while sales as expressed in dollar terms have generally increased over the period since 1954 profits have shown a variable record. It should be noted further that the great expansion of sales by Massey-Ferguson over the period is largely accounted for by expansion of operations outside North America.

81. Perhaps a more useful view of profits is possible if comparisons are made between this industry and other secondary Canadian industries. The Dominion Bureau of Statistics presents such a series of data in the *Canadian Statistical Review*. These are summarized in Figure V. The upper line in this chart shows the dollar profits of all secondary industries in Canada after

¹ Cromarty, *op. cit.*, p. 35-36.

FIGURE V: PROFITS BEFORE TAXES, CANADIAN MANUFACTURING INDUSTRY AND FOUR AGRICULTURAL MACHINERY COMPANIES.

taxes, while the lower one represents the consolidated net profits of the four companies considered above. No particular observation is required of the interpretation of this chart.

IV. AGRICULTURAL MACHINERY IN THE CANADIAN FARM INDUSTRY

A. The Growth of Demand and Output in Agriculture

82. The role of agricultural machinery in the Canadian farm economy can be understood only against a knowledge of some background of the Canadian farm economy, and particularly of the difficulties which have been confronted by the industry over the post-war years.

83. The origin of the low income problem of Canadian agriculture lies very much in the slow growth of demand for farm products over the past decade or two. One of the most powerful influences at work in the economy has been the tremendous growth of aggregate incomes on a national level. This is measured in terms of the disposable income in the hands of householders and consumers which rose from 5,555 million dollars in 1941 to 11,849 million dollars in 1960. On a per capita basis, the increases in income have been from 438 dollars in 1941 to 881 dollars in 1949, increasing to 1,408 dollars in 1960.

84. While this phenomenal increase in incomes has been of greatest advantage to almost all industries in the Canadian economy, it has been of little assistance to agriculture. It has been proved many times that for every one per cent increase in disposable incomes, expenditures on food, measured at the farm gate, expand only by 0.2 per cent. The influence of the slow growth of the demand has been put very forcibly by Professor T. W. Schultz, of the University of Chicago, who has stated that if the increase in demand for farm products over the period 1940 to 1955 had been even half as fast as that apply-

ing to non-food products, there would be no surpluses in the United States today and incomes in agriculture would be much more comparable to those earned by workers in non-farm occupations.¹

85. The implications of the slow growth of demand for farm products has been strongly accentuated by the structure of the agricultural industry. By this is meant that this industry with several hundred thousand individual units and depending very largely on self-employed labour has not been able to place any significant restraint on output in the face of the slow growth of demand. While there have been important adjustments in the structure of the industry reflected in changes in the numbers and sizes of farms, in the capital structure of the industry, and in the labour force, the burst of productivity over the war and post-war years, higher than any major Canadian industry over the period 1945 to 1955, has meant that output has outrun demand. And the expanding production of farm products has fallen on inelastic demands, both of price and income, with a resulting weakness in farm prices. A further factor in accounting for the farm income situation is that the prices of some of the most important Canadian farm products are determined in world markets over which we have no control.

86. Another way to state the farm problem is to assert that Canadian agriculture almost continuously produces surpluses or barely avoids them. This chronic problem arises from the conflict created by the vast improvement in farm technology while demand for farm products grows slowly. Since the pre-war 1935-39 period, there has been almost a 50 per cent increase in agricultural production. But this increase has come about with a 40 per cent reduction in agricultural labour. The increased output is produced with little or no increase in land. This improvement in technology is strikingly illustrated in the fact that each worker in agriculture has at his command today about three times as much machinery as he had even twenty years ago—and much better machinery.

87. But development in agricultural machinery represents only one aspect of changing technology. Significant advances are represented in the introduction of rust-resistant wheats; valuable hay and pasture crops have been adapted to our north temperate climate; new hybrids and new machinery have adapted commercial corn grain production to parts of Canada. And these developments have been paralleled by greatly increased knowledge of the value of fertilizers and by striking advances in chemicals for controlling weeds, insect pests, and plant diseases. Taken together, these developments have considerably more than doubled the physical output per worker in the past 20 years—an achievement unequalled in any other major Canadian industry. A Gordon Commission research shows that, in terms of real value productivity, output per worker in agriculture increased by 80 per cent over the period 1945-1955. The gain by non-farm industry over the same period was about 20 per cent.² In the case of the United States, production per man hour in food grains has more than trebled since 1935-39 and doubled since 1947.³ Gains in productivity in Canada may be judged to be of the same general order. These rapid shifts, accompanied by the sharp decline in the labour force suggest that, far from being an intractable industry subject to little change, agriculture has the capacity on the production side for rapid change. This capacity remains with us and will be most important over the next generation.

² Wood, Wm. and Scott, A., *Output, Labour and Capital in the Canadian Economy*, Ottawa, The Queen's Printer, 1958, Appendix F, Ch. V.

³ *Changes in Farm Production and Efficiency*, U.S.D.A. Statistical Bulletin No. 233, 1960, p.42-3.

88. In contrast to these swift adjustments in farm production, the market for farm products, or the demand for food, advances only slightly faster than the number of mouths to be fed. While the 57 per cent increase in Canadian population over the past 20 years has been rapid, farm production has kept pace with demand, and for some products run ahead of it. The result: actual or threatened surpluses.

89. It is a fact that a large part of any increased income in the hands of the non-farm family goes to automobiles, deep-freezes, television, chamber music and fishing trips—and little to food. Thus, while the economic development and increasing wealth of industrialized countries provides rapidly expanding markets for these non-farm industries, this is not true for agriculture. To the farm industry, the major significance of these factors is in a general shift toward better quality and more highly priced agricultural products. Accompanying the slow growth of domestic demand, and important in accounting for the lagging incomes of Canadian agriculture, is the impact on our exports of the growth of agricultural protectionism in the United Kingdom and Western Europe, and dumping of agricultural surpluses by the United States government.

90. Not only are farmers confronted with markets which expand slowly in response to secular change in incomes, but they also face the inelasticity of response to change in price. The price elasticity of demand for farm products at the farm level is generally low. Low elasticity means that moderate changes in output give rise to wide sweeps in prices. This is a major factor in accounting for the instability or the erratic fluctuations in farm prices. It also means that the production of large crops falling on inelastic demands can be disposed of only at low prices. In the case of Canada, this factor more than any other has led to government action in agricultural marketing.

B. The Pricing System in Agriculture

91. We must ask the question: Can the free market satisfactorily cope with the situation involving rapid production or technical changes pressing on a slowly growing demand? We must answer this question in the negative. This is the conclusion of an authoritative research paper by John Brewster and Howard Parsons of the United States Department of Agriculture.¹ The free market assumes that factor inputs and product can be adjusted fairly quickly—lay off workers, close a plant, meet demands out of inventory.

92. While there has been a great mobility (out-migration) of farm workers and a vast change in the capital structure of the industry, they have not been sufficient to lead to farm prices yielding to labour and capital employed returns comparable with those of similar resources employed in alternative occupations. Nor (1) because of the nature of the economic organization of the industry (involving some half-million production units using self-employed labour to a very great extent) and (2) because of the biological processes implied in farm production, processes which often require years to run their course, it is not possible to render output sensitive to fluctuations in demand. Lord Keynes, addressing himself to the question of effectiveness of the private market in pricing raw products, states that this market so abhors a surplus that it would ruthlessly tear apart the structure of prices rather than admit a surplus.²

93. Let us summarize by stating what seems an obvious conclusion. The free market pricing system will not yield returns to labour and capital factors

¹ "Can Prices Allocate Resources in American Agriculture", *Journal of Farm Economics*, XXVIII, 1946, p. 938-960.

² "The Policy of Government Storage", *Economical Journal*, 48: 191, p. 451-2.

employed in agriculture returns comparable to those earned by similar resources in other industries. The reasons have been indicated: (1) a far from exhausted burst of technology; and (2) the slow growth of demand. To achieve comparable returns for production factors in agriculture, the exodus of people from the land and the retirement of land itself would have to be on such a vast scale that we would scarcely conceive its non-economic consequences.

C. Financial Returns in Agriculture

94. Financial returns to farmers which have seldom exceeded two-thirds those received by workers in other industries have drifted downward over the past ten years. They are now about 40 per cent as much per worker as those in non-agricultural employment. This presents a situation which is intolerable to farmers and clearly not consistent generally with Canadian standards. It has also reached a point where the hardships inflicted on many farm families should be a matter of greater national concern.

95. Over the period since 1947, as indicated in Table V, farmers have been confronted by an almost continuous and substantial increase in the cost of goods and services used in production and in prices they pay as consumers. On the other hand, farm prices have in no measure responded to the buoyant post-war conditions. Net farm incomes have generally drifted downward, particularly when measured in real terms.

* Return per unpaid family worker in the agricultural labour force after an allowance of five per cent interest on owned investment.

** Preliminary.

*** Will be adjusted upward by C.W.B. payments.

96. The cost-price squeeze about which we hear so much is measured roughly in terms of the fact that farm prices have declined about five per cent since 1949, while farm costs have increased more than one-third. The impact of rising farm costs has become more severe as purchased production components have become relatively more important in the farm industry. It is estimated that these have increased from less than 30 to more than 50 per cent of total costs over the period 1940-1960. This, as well as the deteriorating cost-price relationship, is reflected in farm incomes over the past ten years.

97. In contrast to the situation described for agriculture, the position of workers in the non-farm economy has generally been very satisfactory. Wages

and salaries, on a per worker basis, as indicated in Table VI, have increased by 104 per cent, and by 28 per cent in real terms. While the farm industry has been confronted with a reduction of one-third in the labour force over the decade, the number of workers in non-agricultural employment rose by 33 per cent.

98. Comparisons such as those presented are open to substantial criticism in that they tend to overstate the real income position of farm workers. For instance, the farmer generally faces neither time nor expense in getting to and from farm work. Farm products consumed in the home are valued at farm level and thus involve no marketing charges. Further, these prerequisites may

SOURCE: D.B.S.

tend to be undervalued. Housing costs are lower. The independence of the farmer and his family as self-employed workers adds to their real income. Allowance for such factors is sometimes arbitrarily made by estimating them to have a value equal to 15 to 20 per cent of farm income. However, even making generous allowance for these advantages, farm incomes are far below those of city workers.

99. One might well ask—how does the farm family exist on such low incomes? The answer is, in part, that it lives on capital. In the calculation of the labour and management returns to farmers in Table V an allowance has been made for interest on owned capital. This averages about 700 dollars per worker engaged in agriculture. While it may and frequently is used to support the farm family, it is clearly not a labour return. The answer is, in part, that the family lives by part-time work off the farm—work in the woods, in fishing, on roads and other public projects, on construction, and in factories. Data on the extent of such earnings are not yet available, but it is known that this is an increasingly important income source, particularly in Central Canada and the Maritimes. It may amount to as much as one-quarter to one-third of net farm incomes. In the United States it is about half as large as net income from farming.

100. The Prairie and the Maritime regions have suffered the greatest reduction in incomes over the post-war years. In the case of the Prairies, this is

related to the great drop in the price of grains and to difficulties in marketing grains which have been produced. For the Maritimes, it is largely a matter of marketing difficulties with major cash crops, apples and potatoes, which are subject to erratic fluctuations in prices and to a general decline in consumption per capita. There is also the important factor of the slow growth of population and incomes in the region. While the situation in Quebec, Ontario, and British Columbia as reflected by income changes over the post-war years is more favourable than in the regions already considered, the position of the farmer in these areas is far from satisfactory. However, they have been able to maintain net farm income expressed in current dollars more closely to 1949 levels. But, this income, expressed in real terms, has declined by some 20 per cent.

D. The Structure of Agriculture

101. Factors of production in the farm industry as in all industries have a degree of substitutability. Thus if we wish to consider the role of agricultural machinery in the Canadian farm economy, it is necessary to examine the major factors which are employed in the industry. Data to permit such an analysis over the period since 1941 are presented in Tables VII and VIII. It will be observed that over the 18 year period there has been a 17.8 per cent reduction in numbers of farms, the greatest decline being in the Maritime Provinces. In only one area, British Columbia, has there been an increase in number of farms over the 18 years, and even there the trend in numbers has been down since 1951.

102. There are available no data providing a distribution of farms by a capitalization criterion—we have only aggregate capitalization by Provinces. This valuable annual series is now available back to 1941. Based on these, on Census data, and on estimates we observe an increase in total capital of Canadian farms of 167 per cent from 1941 through 1959, and an increase in investments per farm of 225 per cent from 1941 through 1959. A considerable portion of this is of course not real, being identified with a doubling of price levels over that period.

103. While British Columbia experienced the greatest increase in capital values over the period this is in part associated with a 9.5 per cent increase in numbers of farms. Ontario and the Prairie region actually led the country in increased investment per farm. Quebec and the Maritimes experienced increases which fell below the national average. The relative decline in Maritime agriculture is strikingly revealed in the capital investment data.

104. With respect to machinery investment which we generally identify with progress in modern agriculture there was more than a trebling of capital investment per farm in all regions from 1941 to 1959. It is recognized that in view of technological developments in agriculture, investments running upward from \$50,000 per farm might well be required (depending on type of farm) to secure all the economies available to the family organized farm. While we have not the data to determine the proportion of farms meeting such a standard, we may conclude that a fair proportion of farms in the Prairies, Ontario and British Columbia meet these standards; and few in the Maritimes and Quebec.

105. Further structural aspects of Canadian agriculture are presented in Figure VI. The upper portion of this chart shows the relationship between the value of farm machinery and equipment and total farm capital over the period since 1941. What is particularly notable is the rapid rise in total capital values from 1945 through 1951. It will be observed in this connection that

increased investment in farm machinery accounted for very little of this rise. What was, in fact, occurring during that period was a boom in land values.

106. The rapid rise in the rate of substitution of machinery for land and labour apparently came to an end in 1955. Since that date, as shown in Figure V, the real investment in agricultural machinery per acre of improved land and per worker in Canadian agriculture has been declining. In other words, farmers have over the past five or six years been using less machinery per acre and per worker. In economic terms this should mean that investment in other resources is more profitable. However, as we indicate later, there is much evidence to suggest that this is not true. In fact, we show the contrary to be true. What these data imply is the pinch on real farm income over the

SOURCE: Derived from Table VII.

period. Few economists or other agricultural specialists would admit that the mechanization of agriculture has run its course. Thus we may expect investment per acre and per worker to resume the upward trend which was so clearly evident until 1955. This is at least suggested by experience in the United States where machinery investment per acre of improved land is more than double that of Canada. The forces which have operated to yield such results in the American economy may be thought of as latent in the Canadian economy.

107. Again bearing on the structural character of Canadian agriculture is the matter of the relationship between the sales of farm machinery and farm incomes. The basic data for examining this relationship are presented in Figure VII. This figure shows that over recent years purchases of farm machinery has amounted to some seven per cent of cash farm income and 17 per cent of net farm income. It is notable that purchases of machinery in dollar terms have been fairly constant in the face of declining net farm incomes. The relationship would stand out still more clearly if the net farm income figures were presented in real rather than current dollar terms. The data presented in Figure VII are consistent with those presented in Figure VI which relate to total farm investment, machinery investment, and investment in machinery per acre and per man.

FIGURE VI: INVESTMENT IN FARM MACHINERY AND EQUIPMENT. CANADA.
1941—1959.

108. The sensitivity of expenditures on farm machinery to changes in farm income is indicated in Table IX which relates these expenditures to changes in net farm income. The data presented below show this relationship during periods in which farm incomes were expanding and those in which they were contracting. In general these data bear out strongly the evidence presented earlier that the income elasticity for agricultural machinery purchases is high.

FIGURE VII: RELATION BETWEEN FARM INCOMES
AND SALES OF FARM MACHINERY, CANADA.
1947 ————— 1959.

While during the periods of contracting incomes there was two perverse relationships with respect to farm machinery purchases, one of these relates to the war period, and the other to the early post-war period; in the one case there was an acute shortage of farm machinery, and in the other very large unsatisfied post-war demand.

E. Use and Productivity of Agricultural Machinery

109. The current use of agricultural machinery on Canadian farms is indicated by the purchases of various types of farm implements and machinery over the post-war period. These data are presented in Table X. The Table shows that by far the largest single expenditure item has been on tractors; this was followed by harvesting machinery, very largely made up of combines; the only other important category of farm machinery purchases was in haying machinery. The extent to which mechanization has proceeded is indicated by the 1956 Census of Agriculture which reports that there were 500,000 tractors on 389,000 farms in Canada. The latter figure generally describes Canada's commercial agriculture.

TABLE IX

RELATION BETWEEN EXPENDITURES ON FARM MACHINERY AND NET FARM INCOME IN PERIODS OF EXPANSION AND CONTRACTION

Period	Net Farm Income	Expenditure on Hired Labour	Expenditure on Farm Machinery
Expansion			
1945-1948.....	+79	+20	+165
1950-1952.....	+57	+19	+ 15
1943-1944.....	+44	+ 4	+ 87

¹ Miscellaneous includes machines for preparing crops for market or use; spraying and dusting orchard or garden; farm wagons, trucks, and sleighs; water systems, pumps and septic tanks; dairy machinery and equipment; barn, poultry and other farm equipment.

110. The best measure of the net contribution which any factor of production makes is marginal productivity. This term is defined as the net return of over and above the cost of applying the service which is contributed by the last dollar of expenditure in the ownership and use of that factor. Before presenting marginal productivity measures it should be noted that to secure statistical estimates of these is a difficult task. The leading economist who measured marginal productivity on this continent is Professor Earl O. Heady of Iowa State University. While he has conducted many studies of marginal productivity over most of the United States, he summarizes his findings in the statement that marginal productivity per dollar of machine crop services on representative samples of farms in Montana is \$2.13; in Northern Iowa is 0.65¢; in Southern

Iowa is \$1.28; and in Alabama is \$1.07.¹ When one dollar invested yields a return over and above the cost of employing that dollar of investment at the levels indicated above this is then a very profitable investment. Studies of marginal productivity over the years have shown investment in machinery to be one of the most profitable that can be made. However, it must be stated that investment in livestock and feed, according to the many studies that have been carried out, generally yields even a higher return. On the other hand investment in labour generally yields a low return, and that in land and buildings yielded little more than the going rate of interest, if that much. But the general implication of these data stand out clearly—investment in agricultural machinery yields returns well above the cost of the investment. In this sense such expenditures represent a highly economic investment. Of course, in such a statement we must recognize that we are extrapolating American data into a Canadian situation—and into a very different situation so far as farm income and expenditure patterns are concerned. Nonetheless, the general trend of farm management studies in Canada supports the conclusion that in most situations further investment in farm machinery would add to net income.

111. All of these studies bear out the fact that mechanization in agriculture has resulted largely from the fact of very large increase in the value of human effort relative to other cost factors. This is reflected in the increase of 443 per cent in farm wages over the period 1941 through 1959. In contrast to these rapid increases in wages, farm machinery which is the most direct substitute for human labour has increased in price by 128 per cent over the same period. The impact of the rapidly increasing value of human effort compared to that of its direct substitute is reflected in the decline in the Canadian agricultural labour force from 1,200,000 in 1941 to 731,000 in 1959. The mechanization of agriculture deriving from this relatively great increase in the value of human effort has resulted in a remaking of the structure of the farm industry and, at the same time, released well over a million workers who have moved to more productive and higher jobs in the non-farm economy.

V. PROSPECTS AND PROJECTIONS

112. Three or four years ago the author of the present paper and Professor John D. Black of Harvard University prepared a projection of Canadian agriculture from 1955 to 1970.² The purpose of the study was to examine the demands which would be imposed on the Canadian farm industry by 1970 and to prepare an analysis of the ways in which these demands could be most economically met. The study was based on a projected increase of 38 per cent in the Canadian population over the 15 year period and an estimated increase in disposable income per capita of 39 per cent.

113. The work proceeded on a basis of estimating the income elasticity of demand for the major Canadian farm products. To summarize the work in a sentence or two, it was projected that the aggregate of domestic and export demands which would be imposed on the farm economy over this period would require a 39 per cent increase in the volume of agricultural production. The projected expansion of requirements for meats was more than 50 per cent, while that for wheat and potatoes was somewhat less than the indicated increase in population. For other products the projection ranged between the extremes indicated. It was concluded in that study that the 39 per cent increase in aggregate farm output required by 1970 would be met with a decline of 15 per cent in the numbers of farms and of 20 per cent in the agricultural labour force. After the passage of some five years since the work

¹ *Resource Returns, Productivity Coefficients in Selected Farming Areas of Iowa, Montana, and Alabama*, Iowa State University Research Bulletin, 425, 1960, p. 345.

² *The Development of Canadian Agriculture to 1970*, Macdonald College, McGill University, 1958.

was completed, the projections made in that study still look fairly reasonable. However, it must be admitted that some of the trends which were projected are occurring at a rate faster than was suggested in the study.

114. Essentially the work with Professor Black projected an increased commercialization of Canadian agriculture—by which is meant that a much larger proportion of the agricultural output of the country would come from moderately large to large-scale efficiently organized family farms. This still appears to be a reasonable prospect for Canadian agriculture, particularly if the growth rates which applied to the Canadian economy over the first ten or 12 post-war years may be expected to continue. It is expected that the Canadian economy will resume the growth rates applicable to that period.

115. The context in which adjustments in agriculture over the next 15 years may be expected to occur are provided in the statement by Professor E. O. Heady of Iowa State University to the 36th Annual United States Agricultural Outlook Conference held in November, 1958.¹

The need for adjustments within agriculture, and between agriculture and other sectors of economy, is now great and well known. It is extremely likely that adjustment pressures and needs will grow over the next decade, as the forces giving rise to adjustment also intensify in effect. The two major forces which cause need for adjustment arise both within the outside of agriculture. First, within agriculture, is the rapid outturn and rate of adoption of new technologies. These new technologies within agriculture, which have increased farm labor productivity by over 40 per cent since 1940, exert pressure towards three major types of adjustments within the farming industry: (1) They call for larger farms, particularly where they represent increased mechanization and allow the family to operate more acres or animals with the same labor force and/or have higher fixed costs and allow lower per unit costs only as the farm is expanded. (2) They allow the same labor force, particularly those representing biological improvements which increase yield per acre and animal, to produce a greater output; or they allow the same output to be produced with a smaller labor force. Since food demand increases mainly at the rate of population increase, and since technology and labor productivity in agriculture have been increasing at a much faster rate, these technologies mean mainly that the "within agriculture force" is causing labor to be squeezed out, or displaced from the industry. (3) They allow a growth in output at a rate greater than the growth in demand, and thus also, suggest a need for shrinking the magnitudes of inputs used.

115. A further statement which has a bearing on the kinds of adjustments which may be expected is provided in a statement to the same conference by Dr. Kenneth L. Bachman.² Dr. Bachman projects an increase of 87 per cent in investment per farm measured in constant dollars over the period to 1975 and suggests that investment in machinery and equipment will rise to even a greater extent. But with the continued rapid rate of decline in farm numbers, the demands on the farm machinery industry would not increase proportionately. It is interesting that he expects that the proportion of capital financed by credit rather than by farmers' savings will increase substantially in the future so as to make the types of adjustments which he projects economically feasible. Again we are suggesting that the types of adjustments projected by Dr. Bachman will likely occur in Canada.

¹ "Private Action to Facilitate Resource Adjustment", U.S.D.A. mimeo, 1958.

² "Prospective Changes in the Structure of Farming."

116. As the agricultural industry becomes more commercialized and as small-scale and subsistence farms become less important it is expected that the industry will produce incomes which will support the increased investments suggested above. However, as noted earlier such projections depend on restoring a growth rate in the Canadian economy which characterized the first ten to 12 years after World War II.

117. Our agricultural projections suggest that the demand for farm machinery over the next ten to 15 years will outstrip population growth. They suggest also that the farm industry will likely move from its present state of undergoing drastic changes to one of greater stability and more adequate financial returns. Such trends will aid the North American agricultural machinery industry by lending a measure of stability to it. But no assurance can be given that Canadian based manufacturing operations will participate fully in any stabilizing of the North American farm machinery industry.

APPENDIX "B"

INTERNATIONAL HARVESTER COMPANY
OF CANADA, LIMITED
HAMILTON, ONTARIO

MAY 26, 1961.

Mr. Clyde Lyons, Secretary,
Standing Committee,
Agriculture and Colonization,
House of Commons,
OTTAWA, Canada.

Dear Mr. Lyons:

On May 12, when we appeared as witnesses before your Committee, the Honourable Member, Mr. Korchinski, asked if we would file with your Committee the percentages of foundry costs for 1960 in comparison to the percentages shown in Report #5, page 298 of the 1937 Farm Implement Price Inquiry. Attached you will find this comparison for both our Grey Iron and Malleable Foundries.

We would like to point out that we have had increases in the Grey Iron from the 1937 Report to the 1960 figures of 3.7 times in material costs, 4.4 times in labour costs and 6.1 times in burden; and in the Malleable we have had increases of 3.6 times in material, 4.3 times in labour and 9.6 times in burden. We wish to point out the reasons for the increases in the percentage of burden from 1937 to 1960 figures.

Our various employee plans, such as pensions sickness and accident benefits, insurance, hospitalization, vacations and others, are considered part of the burden and this represented 5.6% of the burden in 1935 while in 1960 represented 22.3% of the burden.

In 1935 the foundries were not mechanized to any great extent which provided more labour, but between 1935 and 1950 there was some increased mechanization in the foundries which tended to decrease the labour costs and increases the burden. Also, the tonnage in our Grey Iron and Malleable Foundries during most of the ten year period up to 1935 was at peak capacity while in 1960 the tonnage out of both the Malleable and Grey Iron was greatly reduced, this having a great effect on the increase in burden.

Yours very truly,

W. E. JOLLEY.

MINUTES OF PROCEEDINGS

MONDAY, June 5, 1961.

(28)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Vice-Chairman, Mr. Clifford Smallwood, presided.

Members present: Messrs. Badanai, Campbell (*Lambton-Kent*), Danforth, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), Horner (*Jasper-Edson*), Howe, Kindt, Korchinski, McIntosh, Mandziuk, Milligan, Montgomery, Muir (*Lisgar*), Pascoe, Rapp, Smallwood, Southam, Thomas, and Tucker. (23)

In attendance: From *Cockshutt Farm Equipment Limited*: Messrs. R. C. Tees, President; J. D. V. Adams, Market Research Manager; Mr. M. H. McCurdy, Director of Engineering; G. E. Tinkess, Marketing Co-ordinator; E. R. Vaughan, Manager of Accounting; J. A. MacDonald, Canadian Sales Manager.

The Vice-Chairman introduced Mr. Tees who, in turn, introduced the delegation from *Cockshutt Farm Equipment Limited*.

Mr. Adams presented the brief on their behalf.

The Committee questioned the officials of *Cockshutt Farm Equipment Limited* on their brief.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING

(29)

The Committee reconvened at 2.40 p.m. The Vice-Chairman, Mr. Clifford Smallwood, presided.

Members present: Messrs. Boulanger, Clermont, Danforth, Doucett, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), Horner (*Jasper-Edson*), Howe, Korchinski, McIntosh, Mandziuk, Milligan, Muir (*Lisgar*), Pascoe, Rapp, Regnier, Ricard, Smallwood, Southam, Stefanson, Thomas, and Tucker. (25)

In attendance: Same as at morning sitting.

The questioning of the officials of *Cockshutt Farm Equipment Limited* was continued.

Agreed,—That the statement of consolidated earnings of *Cockshutt Farm Equipment Limited* for the years ending October 31, 1960 and 1959 and the Summary of Agreement dated July 13, 1960 between stockholders of N. K. Winston-Sanson Florida Corp. and *Cockshutt Farm Equipment Limited* be made an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix "A"*)

Agreed,—That graphs presented in conjunction with *Cockshutt Farm Equipment Limited* brief be made an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendices "B", "C", "D", "E", "F" and "G"*)

At 4.43 p.m. Mr. Boulanger drew attention to the lack of quorum. The Committee recessed for five minutes until a quorum was present again.

The questioning of the officials of Cockshutt Farm Equipment Limited was concluded.

The Vice-Chairman thanked the officials of Cockshutt Farm Equipment Limited for their appearance.

At 5.45 the Committee adjourned until Friday, June 9, at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

MONDAY, 9.40 a.m., June 5, 1961.

The VICE-CHAIRMAN (*Mr. Smallwood*): Gentlemen, the Clerk has informed me we have a quorum.

Before we start this morning, Mr. Muir and Mr. Horner have corrections to make in the minutes of proceedings and evidence of our previous meeting.

Mr. MUIR (*Lisgar*): Mr. Chairman, on page 1007 in minutes of proceedings and evidence No. 12 near the top of the page, I am shown as having said, —“their mark-up on farm implements has remained at 25 per cent”. I believe that should be 20 per cent. I think I have been misquoted.

Further down on the page there is a statement attributed to me which I think Mr. Argue made in answer to Mr. Coburn. On this page the following statement is attributed to Mr. Muir (*Lisgar*), but I am sure it was made by Mr. Argue:

These figures are D.B.S. figures, not your figures, so if somebody is proving the farm implement figures are wrong, it is really the dominion bureau of statistics figures which are wrong.

Mr. Argue is not here to confirm this, but I am sure he made that statement.

Mr. HORNER (*Acadia*): My corrections are in respect of the minutes of proceedings and evidence No. 12 at page 1045. In the 27th line, as it reads now, I am shown as making the following statement:

Has the C.C.I.L. ever considered going into the farm implement manufacturing business—

What I meant to say and what I thought I had said was:

Has the C.L.C. ever considered going into the farm implement manufacturing business—

At the bottom of the page, about the second line from the bottom, the words, “Has the C.C.I.L. ever thought of that?” appear. Again it should read “C.L.C.” I will admit it is a bit confusing, because I was using the two sets of letters.

On the following page, page 1046, at line 28, I was again suggesting to the C.L.C. that they may be the founders of a new manufacturing firm. In this line I am quoted as saying, “with some guidance from the C.C.I.L.”. It should be “C.L.C.”.

Mr. SOUTHAM: In the same proceedings at page 1045 I am misquoted. I think possibly it is my fault; I was speaking too fast. I was referring to a statement by Mr. Burt, wherein he agreed it was in the best interest that labour should sit down to discuss these problems with industry and government. I referred to a statement made by Mr. Knowles in Winnipeg at a time when the Prime Minister had appeared on the same platform. At that time it was my understanding Mr. Knowles had said that the only responsibility he had to labour was to see that they had higher wages, shorter hours and more fringe benefits. I am not so quoted in the statement.

Also, in referring to the Prime Minister's statement which he made on the same platform, I said he pointed out that it is the responsibility of labour

to help solve the problem. At the same time he also pointed over the shoulder of labour at industry and suggested they had an equal responsibility. In other words, he was referring to both segments of our industry. On this page I am not so quoted. I would like to make this correction.

The VICE-CHAIRMAN: Does that complete the corrections?

Today we are pleased to have with us the representatives from the Cockshutt Farm Equipment Limited. We welcome you here, gentlemen. At this time it is my pleasure to introduce to you Mr. R. C. Tees, the president of the company. Mr. Tees will introduce the other members of the delegation.

Mr. R. C. TEES (*President, Cockshutt Farm Equipment Limited*): Mr. Chairman and gentlemen, first of all I would like to say we come here with pleasure to assist in what we believe is an important and vital matter; that is, the idea of looking fully into an industry of such importance and significance to the country as the agricultural industry. We realize that this industry, like practically all other industries in Canada, faces a problem which involves the increased mechanization of industry against an expanding and, in some cases, world market.

The group we have brought here to assist in these proceedings surrounds me. First of all, however, I would like to make one point clear. In the brief which is placed before you, you will notice the different indentations of the margins. Through the kindness of this committee, we were given an extension of time to prepare some expansion material which is easily identifiable in the brief before you by the difference in the margins. The narrower margin is the explanatory and expanded information which has been added in the time made available to us. This perhaps will make it a little clearer to you.

On my right is Mr. M. H. McCurdy, director of engineering—a very important segment of our organization. On my left is Mr. J. D. V. Adams, who is the manager of our marketing research branch. Mr. Adams will present the brief on behalf of Cockshutt Farm Equipment Limited. Then we have Mr. E. R. Vaughan, of our accounting department. He will assist the committee in respect of information. Mr. G. E. Tinkess is our market co-ordinator, and Mr. J. A. MacDonald is our Canadian sales manager.

This is our delegation, and we hope we can be of assistance to you today, gentlemen.

Mr. THOMAS: Are these graphs mentioned here to be included in the record?

The VICE-CHAIRMAN: To which graphs are you referring?

Mr. THOMAS: The brief refers to certain graphs which will be presented.

The VICE-CHAIRMAN: I understand they can be reproduced if it is the wish of the committee.

Mr. THOMAS: I would ask that they be included in the record.

Agreed.

The VICE-CHAIRMAN: Thank you, Mr. Tees. I will now call on Mr. Adams to read the Cockshutt brief to you.

Mr. J. D. V. ADAMS (*Market Research Manager, Cockshutt Farm Equipment Limited*): Mr. Chairman and members of the committee,

BRIEF TO THE STANDING COMMITTEE ON AGRICULTURE
AND COLONIZATION
HOUSE OF COMMONS, CANADA
on

THE PRICES OF FARM MACHINERY

Cockshutt Farm Equipment Limited is pleased to submit a brief to the parliamentary committee on farm implement prices. We hope herein to explain to the committee our views, as a company which produces farm equipment exclusively in Canada, and which sells principally in the Canadian market.

This company does not share the view that the price of farm machinery to the Canadian farmer is unduly high.

The term "high prices" by nature implies exploitation of some group of consumers. Exploitation, gentlemen, is synonymous with excessive profits. May we refer you at this time to the audited profit and loss statement of the farm implement division of our company for the past 10 years, as presented here. These are found at the bottom of the first page of our brief, as follows:

*Audited profit and losses in Cockshutt's farm equipment business and their estimated relationship to retail sales is shown hereunder:

	Net Profit/Loss for Year	% to Retail Volume
1951	\$2,094,000.	4.0
1952	2,717,000.	3.8
1953	781,000.	1.3
1954	<u>2,005,000.</u>	<u>5.6</u>
1955	<u>445,000.</u>	<u>1.2</u>
1956	164,000.	.4
1957	<u>28,000.</u>	<u>.1</u>
1958	<u>89,000.</u>	<u>.3</u>
1959	1,528,000.	3.8
1960	<u>1,215,000.</u>	<u>2.9</u>
Total for ten-year period	<u>\$5,932,000.</u>	<u>1.3</u>

As we study these together may I observe with you that in 4 of the last 10 years, the company suffered sizeable losses.

Should shareholder investment be defined as the sum of capital stock and surplus, reserves for inventories and contingencies, and retained earnings, the ten year average profit represents only a 2.85% return on investment. You, gentlemen, know better than I that many other investments, including your own Government bonds, provide over 5% returns—with a fraction of the risk involved in the seasonal manufacture and selling of farm machinery.

Here, gentlemen, we have a graphic representation of the percentage of return on investment, and the ten-year average. It goes from 11.7 in 1951 to 11.9 in 1952, 3.4 in 1953, a loss of 9.4 in 1954, another loss of 2.1 in 1955, a small gain of 0.8 in 1956, followed by two more losses of 0.1 and 0.5 in 1957-58. In 1959 it is 7.6 and in 1960, 5.6. The ten-year average is only 2.85 return on investment.

GRAPH I. Return on Investment Over Past Ten Years

Now choosing return on manual sales as a measuring stick, we have attempted to calculate for your convenience what this return would be on retail or farmer sales dollars. You will observe that earnings amounted to only 1.3% of retail sales over the ten year period.

As Cockshutt is essentially a manufacturer and wholesaler of farm equipment, we generally measure the return as a percentage of the Cockshutt selling price to dealers and distributors. Would you please note with me this return as a percent to Cockshutt selling price over the years.

Would you please note that this is a return of the Cockshutt selling price, rather than retail selling price.

Graph II. % Profit on Cockshutt Sales to Dealers and Distributors.

Year	Percent
1951	5.3%
1952	5.1%
1953	1.8%
1954	—a loss of 7.5%
1955	— a loss of 1.7%
19566%
1957	— a loss of .1%
1958	— a loss of .3%
1959	5.0%
1960	3.9%

You will note that the percentage profit, on Cockshutt sales to dealers and distributors were as follows:

In 1951 it was 5.3 per cent; 1952, 5.1 per cent; in 1953, as with the return on investment, we begin to drop, and it was 1.8 per cent; in 1954 a loss of 7.5 per cent; in 1955, a loss of 1.7 per cent; in 1956, a gain of .6 per cent on sales; 1957, there was a loss of .1 per cent; in 1958, another loss, in the amount of .3 per cent; in 1959, a gain of 5 per cent, and in 1960 a profit on sales of 3.9 per cent.

On this basis the average ten year return amounts to only 1.8 per cent of Cockshutt dealer and distributor sales.

These earnings have been such that no dividends have been declared for the last six years.

I do not wish to belabour the point for it is self-evident. My only desire is to convey to you the simple fact that Cockshutt's profits have been very low, and measured any way you will—by return on investment or return on sales they are unsatisfactory.

Gentlemen, with profits as those disclosed to you, and having a close association with the farmer, our customer, we can and do appreciate the stringency of his competitive position.

In selling a large portion of his produce in world markets, the farmer must meet or better the prices offered by all countries and recently formed trading blocs.

We also recognize his operating costs have risen.

As we go about our business of providing farm machinery, we are very much aware of the cost-price squeeze affecting much of Canadian agriculture.

We also recognize the desirability of bringing to this distressed segment of the economy some measure of relief.

But it must be borne in mind that the farm machinery industry in this country also sells its products in world-wide competition. The price which Canadian farmers pay for machinery is not dictated solely by domestic issues, such as factory cost increases. Rather, Canadian produced farm machinery has to be sold competitively in the Canadian market with the produce of the

extensive American industry, and with overseas imports. The prevailing prices are those dictated by farm machinery prices the world over.

In business today, gentlemen of the committee, you know world-wide price competition is not idle talk.

I should like to cite an example of what I mean from our own industry. Within the last four years, the 27-33 H.P. tractor market has been taken over by small foreign diesels. Last year the dominion bureau of statistics reported over 5,000 of these units were sold in Canada. This quantity amounted to over 20 per cent of the total number of tractors sold in this country of all makes and sizes. At this time the majority of the major farm equipment companies either manufacture or buy this tractor in another country, for resale in Canada.

At Cockshutt we designed and costed a diesel unit of this class for manufacture in Canada—only to find it was more economical to purchase a model in Italy.

May I draw to your attention the hourly wages paid in manufacturing in foreign competitive countries. *Graph No. III* shows the hourly wage rates paid in foreign competitive manufacturing.

You will note, from the graph, that in the case of Japan, it is 25 cents an hour; Italy, 51 cents an hour; Belgium, 60 cents an hour; West Germany, 67 cents an hour; United Kingdom, 80 cents an hour; Norway, 86 cents an hour; France, the same, 86 cents an hour, and, in Canada, \$1.90 per hour. You will note that Canada's rate is only exceeded by that of the United States, at \$2.25 an hour. These are wage rates, excluding fringe benefits paid in foreign competitive manufacturing.

Mr. DANFORTH: Will you indicate the year?

Mr. McINTOSH: And, the authority?

Mr. ADAMS: Yes. This is quoted from an article taken from the *Financial Post*, and I believe it is August 20, 1960—wages in foreign manufacturing.

Mr. FORBES: What is your authority for your Canadian rate? Is that your factory rate or somebody else's?

Mr. ADAMS: Our factory rate is very close to this. If you would wait a minute, I will tell you the exact rate.

Mr. FORBES: I am sorry to interrupt you, but we have not the graph in our brief here, in order to indicate that later reference.

Mr. ADAMS: I apologize for that. Our problem was that, as we made them big enough to see in the hall, we could not reproduce them down to a satisfactory size, as our camera was not large enough.

Mr. FORBES: Did I understand you to say that the Canadian rate is exclusive of fringe benefits, or includes them?

Mr. ADAMS: It is exclusive of fringe benefits.

To answer your first question, this was taken from the August 20th edition of the *Financial Post*, 1960—Average Wage Rates in Nine Countries.

Our own wage rate, gentlemen, in 1960, excluding fringe benefits, was \$2.09. In 1959 it was \$1.94.

Mr. HORNER (*Acadia*): This is all manufacturing; not only agricultural implements, but all manufacturing?

Mr. ADAMS: This is all manufacturing; the rates I am quoting are farm implement division rates. For the six month period in 1961 it is \$2.17 per hour.

Mr. TUCKER: Is the \$2.17 Cockshutt's rate of pay?

Mr. ADAMS: Yes.

What does this mean to us? This is the foreign picture of wage rates, and the magnitude and rapid increase in imports of foreign farm equipment is

clearly visible in graph IV. Imports increased \$75.5 million between 1958 and 1959—and this is taken from the *Trade of Canada*, volume No. 1. We believe this trend is continuing.

I submit to you, this is price competition in the extreme when manufacture has to be abandoned by the industry in this country. The farmer benefits from this world-wide competition.

We can sympathize with farm spokesmen when they point out as they did in the *Western Producer* on November 3rd, and I quote: "Canadian farmers are asking only that agriculture receive a measure of the consideration which federal governments over the years have given to eastern industries".

But we would seriously question whether, among those industries to which the farmers refer, the agricultural machinery industry could possibly be included.

Production of farm machinery in Canada takes place under circumstances which, in many Canadian secondary industries, might well mean the disappearance of exclusively Canadian producers. Farmers deplore the tariff protection accorded to manufacturing industry, but farm machinery production in Canada has had no tariff protection for 16 years. This is a circumstance almost unique in Canadian secondary industry, and one which places Canadian enterprises in this field at an obvious disadvantage as compared with other secondary industries in Canada.

For instance, electrical manufacturers receive from 15 to 22½ per cent tariff protection on many of their products.

Imported automobiles, other than those receiving British preferential treatment, are subject to 17½ per cent duty. Wearing apparel is dutiable at 25 per cent. Furniture manufacturers receive protection at the rate of 15 to 25 per cent depending upon the classification of the exporting country.

Nor does the farm machinery industry receive the "subsidies" so often decried by farmers when they discuss Canadian manufacturing. In fact, the legislative enactments which bear upon this industry's operation have effects, which more frequently than not, are quite the opposite of encouragement to the industry. Legislative regulations, for example, impose on the industry the costly requirement of carrying repair parts for every farm machinery for a ten-year period after its production has been discontinued.

That this is a financial burden on the companies there can be no denying! At Cockshutt we carry approximately 50,000 parts with an average annual turnover of less than "1"—in fact about "½".

Mr. MUIR (*Lisgar*): What does that "1" and "½" represent? Is that a percentage?

Mr. ADAMS: That is turnover of parts.

Mr. MUIR (*Lisgar*): Once?

Mr. ADAMS: Once a year, or less than once a year.

The quantities required of many of these parts are so small that economical production runs are not possible. To this high cost of manufacture of course must be added that of handling and warehousing for extended periods.

Another legislative enactment, allows the farm equipment companies to use machinery in their plants which is imported duty free, only for the production of farm implements. While this is a concession which the industry appreciates, it nevertheless carries with it a costly restriction against taking on outside work for these machines during the recurring slack seasons which the industry experiences.

Financing of sales is another case in point. The liberal terms of credit under which farm machinery is sold today, and the resulting credit load carried by the selling concerns, in financing both dealers and ultimate buyers, are without parallel in any comparable industry.

While the company supposedly charges a standard rate for farmer credit, competition is so keen that it is necessary to accept many interest free notes. This has the net effect of reducing the actual interest earned to less than 3 per cent of the money loaned.

As an exclusively Canadian producer, we would also point out to the committee, that the provisions of the Farm Improvement Loan Act, while they afford valuable assistance in financing the final sales of farm machinery, are applicable without distinction, to the financing of both domestically-produced and imported goods. This feature is of undoubted benefit to the farmer, but its net effect on the producers of farm machinery in Canada is open to serious question.

Even the matter of crop seasons holds advantages for Canadian farmers, at least in western Canada. The heavy selling season for harvesting machinery is some weeks later in western Canada than in the principal grain growing areas of the United States—a fact which provides the large American companies based in the Chicago and Milwaukee areas with the opportunity of clearing their fall stocks in Canada at sacrifice prices, if they deem it necessary. Sellers of Canadian produced machinery must either meet these prices or forfeit sales entirely.

Now, concerning retail list prices, we would stress that any suggestion which would link the prices which farmers actually pay for equipment with the prices contained in the lists put out in the industry, is erroneous and dangerously misleading. For larger machines at least, the acceptance of farmers' trade-ins as partial payment is now standard practice. Thus the presence of vigorous price competition in the industry is apt to be obscured from the outside observer, since most effective reductions below list price are contained in the trade-in allowances. From our own point of view we do not consider this a particularly desirable form of competition, nevertheless, it is one which has developed.

It might be claimed that Canadian-produced farm machinery could be sold in the United States without difficulty. This is not so now, and never has been. American farmers have traditionally shown a tenacious preference for American machines over those of exclusively Canadian producers, even though the latter be competitive in price and quality. In spite of the fact that there has been no American tariff on farm machinery since 1913, no Canadian producer has ever secured substantial sales in the United States without first acquiring substantial productive facilities in that country. In our own case, we attempted to circumvent this necessity through selling arrangements with the national farm machinery cooperative in the United States after the war. Despite some early success, these have all but broken down in the depressed markets of recent years.

Turning to Graph V you will observe that our percentage of sales in the United States and export markets has dropped substantially in recent years, and is continuing its downward trend.

Among the domestic issues which have contributed to higher costs and prices are sizeable increases in labour, material, freight and taxation. These factors by their nature have affected all manufacturers in the farm equipment industry. Furthermore, they are for the most part beyond the control of our company.

Turning to Graph VI let us observe the relationship among average hourly earnings, average steel costs, farm machinery prices and farm income for the years 1950-1959. Regarding the first of these—labour costs, the dominion bureau of statistics reports that in the manufacture of Iron and Steel products, (in which category is included farm implements), average hourly wages have in-

creased 73.3 per cent from 1950 to 1959. Furthermore, wages have risen since that time, and are expected to continue their upward trend.

Have these gains been inflationary or has productivity kept pace with wage increases?

Recently the U.S. Bureau of Labour reported—the average gain in productivity of production workers in manufacturing was only 3.7 per cent per year. I presume their study would apply throughout North America.

Where then does this leave the implement industry, which must provide so many different tools for the farmer with associated small volumes of each? Much of even this 3.7 per cent per annum increase in productivity is denied the farm machinery manufacturer; for small volumes prohibit costly automation. The wide discrepancy between productivity gains and wage increases must result in only one thing then—higher costs and through necessity higher farm machinery prices.

Regarding material costs, which are an extremely high percentage of the factory costs of farm machinery, a selection of several types of our major material—steel—shows a rise in price of 55.8 per cent in the ten years from 1950 to 1959. This increase in cost has to be absorbed or included in the value of the machine.

Freight rates for carload lots of agricultural implements from Brantford, Ontario to Regina, Saskatchewan rose from \$1.99 per cwt. in January of 1951 to \$2.89 per cwt. in January of 1960—an increase of .90 cents per cwt. or 45.2 per cent.

Property and business tax on our main plant kept pace with this staggering rate of rise, measuring a 75 per cent increase for the years 1954 to 1960.

Gentlemen you can see that while farm machinery prices have increased, this increase is not out of proportion with increased costs. What may be out of proportion is the much smaller increase in gross farm income from the years 1950 to 1959, or in net farm income, which was actually a decrease.

It is evident that costs of manufacture have increased considerably. At the same time Cockshutt has had to meet increasingly intensive world-wide competition.

For the foregoing reasons, far from agreeing that machinery prices are unduly high, we would contend that Canadian agriculture receives the benefits of world-wide price competition in farm machinery, and that these are re-enforced by a number of domestic enactments and circumstances in the market, which, though of assistance to agriculture, may already be taking a serious toll in terms of the volume of farm machinery manufactured in this country.

While genuinely concerned with the present problems of agriculture, we cannot accept the contention that they are attributable to the prices which farmers pay for machinery. Canada's farm equipment manufacturers are also caught in a serious cost-price squeeze resulting from rising costs and competitive pressure on price. From the national point of view, the question of what this will mean to the future of farm machinery production in Canada can surely not be overlooked.

In spite of this, we are not recommending the re-imposition of the tariff on farm machinery, advantageous as that would be to the industry. We recognize the realities of our situation, and are prepared to continue competing on the basis of prices set by world competition. Nevertheless, we do feel strongly that some assistance might be considered for Canadian producers of farm machines. Specifically, we would recommend the following measures of relief to the Canadian farm machine industry for consideration of the committee:—

- (a) Income tax relief on domestic sales for Canadian farm machine manufacturers.

- (b) Amendment of the Farm Improvement Loan Act to provide for some financial encouragement to farmers to purchase Canadian-made machines.
- (c) That harvesting machines imported into western Canada, after a certain fixed date—say June 15th, be subjected to a dumping duty.

We feel that further study along this line is warranted, and if so, the impetus for it might well come from the parliamentary committee on farm implement prices, to which this is respectfully submitted.

The VICE-CHAIRMAN: Gentlemen, we have just heard the brief presented by Mr. Adams. I am sure the committee will agree with me that Mr. Adams was very thorough in presenting to us this brief and we wish to express our thanks to him. The committee is open for questions and Mr. McIntosh has the floor.

Mr. MCINTOSH: Mr. Chairman, I have been trying to get a definition of the term "farm implement" or "agricultural implement". I wonder if Mr. Adams could give his definition of the term "agricultural or farm implement", as used on pages 1 and 15 of this brief.

Mr. ADAMS: Mr. Chairman, as far as farm implements are concerned here, our company manufactures tractors, combines, and many other implements. We consider ourselves a full-line company in farm machinery. There are a number of implements that we do buy and market through our Cockshutt organization but we do manufacture tractors, combines, rakes, mowers, plows, and so on.

Mr. HORNER (*Acadia*): What about truck boxes?

Mr. ADAMS: That is not considered a portion of our farm implement division.

Mr. MCINTOSH: Maybe I did not make my question clear enough. I have been having difficulty with the Department of National Revenue in regard to the term "farm implement" or "agricultural implement", and I cannot get them to accept the commonly used definition as used in legal or standard dictionaries or in any publication referring to "agricultural implement". I am trying to strengthen my case with them. I would like your firm—it does not matter whether it is yourself or some other of these gentlemen—to give me a definition of what they understand an agricultural implement to be.

Maybe to assist you I could give you the legal dictionary definition which is this: A farm implement is defined as "a thing of necessary use in any trade". The word "necessary" is defined as "those things to the doing of a thing which are reasonably required". Our ready reference dictionary says: an implement is defined as "a means or agent for accomplishing a purpose".

The VICE-CHAIRMAN: Gentlemen, I do not think the gentlemen have an answer for you to that question. So I will have to call on Mr. Muir.

Mr. MUIR (*Lisgar*): Before I start my questions, I would like to ask a supplementary question to Mr. McIntosh's. Would you consider a combine cab part of a farm implement?

Mr. ADAMS: A combine cab would be a part of an implement. Our company does not manufacture then.

Mr. MUIR (*Lisgar*): I understand at the present time they are manufactured, and I am wondering what would be your answer to that, as to whether it is part of a farm implement.

Mr. ADAMS: When it is attached as original equipment on a combine, our opinion would be it would be part of a farm implement.

Mr. MUIR (*Lisgar*): It is just when it is brought in separately that it is an implement?

Mr. ADAMS: We would have no knowledge because we do not manufacture them.

Mr. MUIR (*Lisgar*): Do you build snowblowers?

Mr. ADAMS: No, we do not, sir.

Mr. MUIR (*Lisgar*): My first question is on page 2, return on investment over the past 10 years. Would you agree that your earnings on retail sales would appear to be somewhat lower than that of the other manufacturers and industries?

Mr. ADAMS: Mr. Muir, these are our earnings, our percentage of sales and investments. I am not informed enough to speak on those of other companies.

Mr. MUIR (*Lisgar*): I think that other witnesses gave roughly the average figure of 3 per cent on the retail sales.

Mr. HORNER (*Acadia*): One company did.

Mr. MUIR (*Lisgar*): Turning to page 5, how much of your factory efficiency or lack of it is due to automation or perhaps lower man-hour output?

Mr. ADAMS: Very little of our factory—in fact I hazard to guess none of our factories—is what you could consider as automated in the true sense of the word, as employing transfer machines and so on. So automation has not come to our company in that sense, and I doubt very much if it has to come to very many others in the industry.

Mr. MUIR (*Lisgar*): Then you would consider your man-hour productivity perhaps low, would you not?

Mr. ADAMS: We have made attempts to improve it through improved methods. I am thinking of the welding techniques. We have intensively attempted to improve this thing, and have spent considerable sums of money at various times in streamlining the flow of materials and attempting to improve the output per man-hour.

Mr. KORCHINSKI: I have a supplementary question to that. I was wondering whether you had any incentives for workers such as piece workers?

Mr. ADAMS: Mr. Korchinski, that is right, we do have incentives. I would say, calculated on a dollar basis, that about 45 per cent of our production workers are on incentive.

Mr. MUIR (*Lisgar*): When the Canadian labour congress was here before us they presented conclusions that came from the royal commission on Canada's economic prospects in which they pointed out that Canadian wages were 25 per cent lower than those in the United States, while productivity in secondary industry was 35 to 45 per cent. They said that did not apply to the farm machinery industry, but I believe Fullerton and Hampson did say, in the report to the royal commission, that it was 32 per cent below that of the United States. The labour group repudiated the idea that there was any less efficiency or lower man-hour production in Canada than in the United States. Would you agree with that statement?

Mr. ADAMS: I can quote from the Canada 1960 year book which does say that the increase in productivity per man in recent years has been greater in agriculture than in any other Canadian industry, and they say that it was 48 per cent between the years 1946 and 1957. They say that in manufacturing the increase was about 40 per cent.

Mr. MUIR (*Lisgar*): The increase in productivity was about 40 per cent?

Mr. ADAMS: That is what they say. We would seriously question whether this type of thing has happened in the agricultural machinery industry for the reason that our volume is very small, which almost prohibits costly automation, and secondly that we make so many different machines that we are also unable to automate to any large extent for that reason.

Mr. MILLIGAN: Particularly different lines of machines.

Mr. ADAMS: And small volumes of each.

Mr. MUIR (*Lisgar*): May I continue my questioning?

The VICE-CHAIRMAN: If you do not take too much time.

Mr. MUIR (*Lisgar*): I would like to go on with one or two more. The next one has to do with the tariff-free situation farm machinery is in. Would you not agree that not having a tariff on farm implements is an advantage, that it does open up large markets for you in the United States? I mean it does open a potential market, although it has to be farmed or worked upon. Would you not agree that it is mutually advantageous?

Mr. ADAMS: Mr. Muir, our own experience has been that we have been unable to make a great deal of progress in the United States, as we tried to point out. Conceivably, there is a very large market there.

Mr. MUIR (*Lisgar*): I have a number of questions, but I will let them go.

The VICE-CHAIRMAN: I have about twelve names down here.

Mr. HORNER (*Acadia*): I am concerned, Mr. Adams, with your world pattern of trade. You suggested on the graph that 24 per cent of your production was exported. Was this last year or in 1959?

Mr. ADAMS: In 1959 our percentage of sales to the United States was 26.6 per cent. In export it was 5.3 per cent, as opposed to, say, 1954 when our percentage of sales in the United States was 24.8, and in export it was 24.1 per cent.

Mr. HORNER (*Acadia*): In other words, back in 1954, all your exports were going to the United States, whereas today there are only 5 per cent of your exports going to the United States. Am I interpreting the figures correctly?

Mr. ADAMS: I am sorry; it is the other way around. The exports in 1954 to all other parts of the world other than the United States were 24 per cent. In 1959 they are only 5.3 per cent. Our total sales outside Canada in 1954 were 48.9 per cent, whereas in 1959 they are only 31.9 per cent.

Mr. HORNER (*Acadia*): If I understood you correctly, 31 per cent of your sales are export. I do not want to belabour this, but I want to get the figures clearly.

Mr. ADAMS: That is correct. Say 32 per cent, rounding it off.

Mr. HORNER (*Acadia*): 32 per cent of your sales are export, and a very big proportion of that goes to the United States?

Mr. ADAMS: That is right.

Mr. HORNER (*Acadia*): To which other countries do you export? Have you any idea? Australia would be one, I suppose.

Mr. ADAMS: We have exported to Australia, South Africa, South America, Mexico, Morocco and Burma.

Mr. HORNER (*Acadia*): But a smaller amount to these other countries?

Mr. ADAMS: That is correct—of recent years.

Mr. HORNER (*Acadia*): Your export, even to those countries has fallen, has it?

Mr. ADAMS: Most decidedly. It is the place where it is falling.

Mr. HORNER (*Acadia*): What per cent of your sales in Canada here are towards C.C.I.L.? Have you any idea of it?

Mr. ADAMS: Our percentage to C.C.I.L. is quite small. It is only about 8 per cent

Mr. HORNER (*Acadia*): 8 per cent of your production or your total sales?

Mr. ADAMS: Yes.

Mr. HORNER (*Acadia*): If it is 8 per cent, that leaves roughly 60 per cent of your production to your own dealers. Am I right in this?

Mr. ADAMS: That is right. That is 8 per cent of the Canadian sales.

Mr. HORNER (*Acadia*): Of the Canadian sales. That would tend to make it a little bit smaller under world-wide sales, would it not; but then it is relatively close. To clear this up in my own mind, the Cockshutt Farm Implement Company is the owner of, or has the large substantial ownership in the Brantford Coach Manufacturing Company?

Mr. ADAMS: The Brantford Coach and Body Company?

Mr. HORNER (*Acadia*): Yes?

Mr. ADAMS: It is a wholly owned subsidiary of Cockshutt.

Mr. HORNER (*Acadia*): None of these figures you have given the committee today includes this subsidiary—which is coach and body manufacturing?

Mr. ADAMS: That is correct. These are farm implement division figures.

Mr. HORNER (*Acadia*): In the publication issued by Mr. Phillips, on the agricultural implement industry in Canada, issued about 1956, he stated as follows—and I wonder if you could give me some idea as to what he means by this statement:

The Americans are permitted to reap the benefits of government guaranteed credit arrangements in Canada under the Capital Assets Farm Improvement Loans Act, but Canadians selling in the United States are deprived of this advantage.

Have the United States got provisions or legislation similar to the Farm Improvement Loans Act, and are Canadian manufacturing companies permitted to take advantage of it?

Mr. ADAMS: We are not entirely versed on how the selling arrangements or the terms of credit work in the United States. However, it is our belief that there are no such arrangements as we have in Canada under the Farm Improvement Loans Act.

Mr. HORNER (*Acadia*): Do you not think it would have benefited your argument or your recommendation, if you could have given the committee some information along those lines? It would have substantiated or otherwise your argument towards amending the Farm Improvement Loans Act.

Mr. ADAMS: We would be very pleased, Mr. Horner, to find out and forward to the committee the selling arrangements in the United States.

Mr. HORNER (*Acadia*): Thank you.

Mr. DANFORTH: I have four questions of a general nature which will require short answers. May I begin by a general statement. I think I express the feeling of the committee when I say that, although numerous questions may be asked today, that should in no way detract from the credit which should go to this company both in regard to the composition of this brief and its presentation. Under the general terms of the machine company, due to the number of farm machines that you produce or offer for sale, is it true to infer that this company can be classified as a company which represents a full line of agricultural machinery?

Mr. ADAMS: We consider ourselves a full-line company.

Mr. DANFORTH: Yes, under the general classification you are considered a full-line company. Then do you feel, as a company which is classified as such, it puts you in a better competitive position to take a larger part of the market, due to the fact that you do have a full line of production, against the company that is putting out a specified machine and using that as its sole source of revenue?

Mr. ADAMS: Yes, we do. For one thing, from the simple point of maintaining a dealer organization.

Mr. DANFORTH: Since you are one of the few machine companies we are dealing with, which is strictly Canadian in its manufacture, do you feel you would be in a better position to sell a line of equipment, at even lower prices to the farmer, if you had international production facilities?

Mr. ADAMS: We have no experience with that; but under the broad scope of the question, we would think that there would be certain advantages, definitely.

Mr. DANFORTH: May I say my questions are not trick questions; they are of a general nature and should be taken as such. I note that in four years, as illustrated by your graphs, the company showed a definite loss in the farm implement division. Is it possible that that loss could be due, not so much to loss of sales or increased competition, but to major retooling and model change-overs in those four years which would incur tremendously increased expense?

Mr. ADAMS: No, this would not be the case.

Mr. DANFORTH: This is based on definite sales alone. Is that true?

Mr. ADAMS: I would like to give some idea of the sales figures. Our sales either declined or stayed much the same with increased costs in the years of those losses.

Mr. DANFORTH: Could those increased costs be attributed to model change-overs and increased retooling expenses?

Mr. ADAMS: No.

Mr. DANFORTH: On page 15 I note your three suggestions for consideration by the committee, and we appreciate them very much. Has the economics branch of your company made any calculations as to whether, if these three could be implemented, they would reflect any reduction in the costs of agricultural implements to the farmer, or would they simply be benefits to put the company itself on a better or a firmer economic basis in Canada?

Mr. ADAMS: I would like, if I may sir, to talk on the first of these recommendations. It is an income tax relief on domestic sales for Canadian farm machinery manufacturers. We envisaged this, also, as income tax relief for the farmer on Canadian-made machines. It might be termed, for instance, an investment allowance, where the farmer could, on Canadian produced machines, value his machinery at greater than cost, as is done in some other industries, to enable him to have a more advantageous write-off on his machine. In this instance, we feel this would do the farmer a great deal of good, and it would also help ourselves.

Mr. DANFORTH: Could you comment to the same degree on the other two?

Mr. ADAMS: The amendment to the Farm Improvement Loans Act which we have suggested here is put in because we are not aware that any other government finances imported goods on an outright basis, as our government does under the Farm Improvement Loans Act. The adoption of this suggestion would benefit ourselves, but if it did that, it would increase our volume and certainly improve our costs of manufacture. That may also in turn benefit the farmer.

Mr. DANFORTH: Would item (c) not cause any increase in the price of farm machinery to the farmers?

Mr. ADAMS: I do not know if it would cause an increase. It could well cause a shift in the manufacture, and thereby enable us to produce longer runs, with its associated economies.

Mr. DANFORTH: You speak of a shift. What do you mean by that?

Mr. ADAMS: If there were import duties after a certain date, this would prevent other manufacturers, as we say, clearing their fall stocks at sacrifice prices, at our expense.

Mr. DANFORTH: I just do not understand that. Would it not be possible, regardless of what date duties were put on the importation of farm machinery, for other companies to circumvent that by increased shipments prior to that participation?

Mr. ADAMS: Oh yes, it would be; but, of course, this would not be economical for them. It would mean greater volume that could be left in inventory.

Mr. HORNER (*Acadia*): I have a supplementary question. You suggest that American companies are selling at sacrifice prices in the fall of the year. Are they selling to their dealers, or to the farmers at the sacrifice prices? In other words, what evidence do you have to substantiate that statement?

Mr. ADAMS: I think we have no categorical evidence whereby we can say this, but we know that it is going on. You must understand that this is a very difficult thing to substantiate. I shall be frank with you in saying that we do not have "transactionary" evidence of this kind.

Mr. HORNER (*Acadia*): Do they sell to their dealers, in your belief, or to the farmers?

Mr. ADAMS: Some of the companies sell to dealers. We believe they have their selling arrangements; and they may sell to dealers or they may go right to the farmer.

Mr. MANDZIUK: I have a supplementary question. Could you prepare a graph which would show these larger imports of farm machinery from the United States? You mentioned the date of June 15. I wonder if you have any data on that statement?

Mr. ADAMS: No, we do not have it.

Mr. MANDZIUK: I mean data which would substantiate your statement that they are really dumping what is left.

Mr. ADAMS: Our only measure has been the feel of the market in respect to this thing.

Mr. HORNER (*Jasper-Edson*): We have had substantial evidence before the committee that the pricing of farm machinery was in the nature of all the market would bear, and that demand was a major factor in the pricing of farm machinery. Does your company agree with that proposition; in other words, that of the two factors, the cost factor and the demand factor, the demand factor was the important one, and the cost had little bearing on it?

Mr. ADAMS: There is a great deal of competitive pressure on the price. This, we believe, is indicated by the margins of profit that we have shown you today. Of course, costs have something to do with it. You must recover your costs in order to remain in business. On the other hand, competitive pressure of price on a world-wide basis has even more effect on price.

Mr. HORNER (*Jasper-Edson*): I have one more question: with regard to freight costs and transportation, does your company transport any of their tractors to western Canada by truck, or are they all shipped by rail?

Mr. ADAMS: Mr. Horner, it is all done by railroad.

Mr. HORNER (*Jasper-Edson*): Do you have any agreed charges with the railways for the transportation of your goods, or are you paying on them commodity rates, or have you ever applied to the railways for agreed charges through the fact that you are transporting all your goods by railway?

Mr. ADAMS: We do not have any special treatment.

Mr. HORNER (*Jasper-Edson*): Have you ever made an approach to the railways?

Mr. ADAMS: Our traffic department is continually in contact with them. Whether or not there has been an approach made, I would not know. I asked our traffic people for a copy of the rates from Brantford to Regina on a carload of agricultural implements, and those were the figures I quoted in the brief.

Mr. HORNER (*Jasper-Edson*): I appreciate that. On the other hand, some of the American companies are now shipping tractors into western Canada, for example, by these semi-trailer deals, and they claim they are getting substantial saving in freight rates or in transportation costs by moving those tractors to the market in western Canada in that fashion. Do you not think that your company, as a Canadian company, should be investigating the possibility of moving their tractors to western Canada along similar lines, so that once you have that competitive factor you can go to the railways and say: "Will you not meet the competition if you want to continue to haul our tractors?" I suggest that here is a place where you might make a saving.

Mr. ADAMS: The gentlemen who are with me tell me that we are checking on that type of thing. However, we shall certainly be pleased to check it again.

Mr. HORNER (*Jasper-Edson*): Thank you.

Mr. MUIR (*Lisgar*): I wonder if Cockshutt uses the seaway as far as the Lakehead for their shipping?

Mr. ADAMS: No, we do not, with the exception of some products we import, which come into Montreal and Hamilton.

Mr. MUIR (*Lisgar*): Is there not possibility that you could lower your transportation costs? I know it would involve re-loading and warehousing at the Lakehead, perhaps, but I would imagine there would be a substantial saving over the railways.

Mr. HORNER (*Acadia*): Particularly on shipments to Manitoba.

Mr. MUIR (*Lisgar*): Yes, particularly our shipments going to Manitoba. I do not think I have received an answer.

Mr. ADAMS: Your answer would be that this is constantly under review—I mean this question of freight rates—and we will certainly look into the matter.

Mr. MUIR (*Lisgar*): I should think that in the case of Manitoba shipments you could ship them to the Lakehead by water, and then from the Lakehead on by rail. I think there would be a substantial saving.

Mr. ADAMS: We appreciate your suggestion.

Mr. MUIR (*Lisgar*): As long as it is passed on to the farmer, of course.

Mr. MANDZIUK: Fat chance of them doing that!

Mr. PASCOE: At page 13 of your brief you say that freight rates increased in the period from 1951 to 1960 by 45.2 per cent. Would Mr. Adams indicate in what year the greatest increases occurred?

Mr. ADAMS: I can quote you the January figures for each of the years from 1951 to 1960. In 1951 it was \$1.99; in 1952 it was \$2.23; in 1953 it was \$2.42; in 1954 it was \$2.53; in 1955 it was \$2.53; in 1956 it was \$2.36; in 1957 it was \$2.72; in 1958 it was \$2.72; in 1959 it was \$3.17, and in 1960 it was \$2.89.

The VICE-CHAIRMAN: Gentlemen, I see it is just about two minutes before the house sits. This would be a good time to break off until 2.30 this afternoon in the same room, when the floor will be held by Mr. Milligan.

AFTERNOON SITTING

MONDAY, June 5, 1961

The VICE-CHAIRMAN: Gentlemen, I see we have a quorum.

I have a list of approximately ten or eleven members who have questions to ask.

As we will be here for some considerable length of time and, as it is rather warm in here, if any member—and this relates to the witnesses, as well—wishes to take his coat off, he has leave to do so.

Mr. Milligan has the floor.

Mr. MILLIGAN: Mr. Chairman, I, too, like one of the other members, would like to congratulate the Cockshutt people on this brief. I was looking forward to it, and I am not disappointed. I believe you have brought out some very good points in this brief which we should be considering.

I was quite concerned in this connection. A couple of weeks ago I was down to one of the distributors at Cyrville and I noticed a number of Italian tractors on the floor with "Cockshutt" across them. The distributor told me that his biggest sales were in connection with these tractors made in Italy. My question is: Do you find it more profitable to purchase this foreign equipment and wholesale it, than to manufacture your own, or can you not produce the tractor the same as it is?

Mr. ADAMS: I stated in the brief that we designed and costed a small diesel tractor in this class which, granted, utilized much of the tooling of our present small gas tractor. However, with our best effort we could not make one as economical as an imported Italian tractor.

Mr. MILLIGAN: Are you importing any other line of machinery from that same source, besides tractors?

Mr. ADAMS: No.

Mr. G. E. TINKESS (*Marketing Coordinator, Cockshutt Farm Equipment Limited*): We are importing a hay baler.

Mr. ADAMS: But that is not from Italy.

Mr. TINKESS: It is from France.

Mr. ADAMS: We are not importing any other machines at this time from Fiat, in Italy. However, we are importing a baler, as Mr. Tinkess pointed out, from France. This will not be our main line of balers, but a supplementary baler of a new type—low density baling. This is something new which we plan on introducing. We are giving this French baler a try.

Mr. MILLIGAN: Is there another factor there, in that you could retail it for less money than you could produce one in Canada?

Mr. ADAMS: For instance, we could not produce and sell a similar make to this tractor competitively, without importing it from Italy. Therefore, I would have to agree with you.

Mr. MILLIGAN: I think you mentioned about a lesser turnover in parts of 1 per cent, which would make it much more costly. Do you think that this trend which you are adopting of importing machinery is going to cut down to a much lesser degree the percentage of parts, and is that not going to increase the price of parts for machinery due to the fact that you are producing less—and, as I say, if this trend of importing machinery continues.

Mr. ADAMS: Of course, those parts used on imported units are not manufactured by our company; they are imported parts, and by that very nature, the manufacturing profit goes to another country.

Mr. MILLIGAN: I am thinking of the parts for the machine that you are manufacturing in Canada.

Mr. ADAMS: We still make—

Mr. MILLIGAN: But if there was less turnover, are they not going to cost more? I know you mentioned 1 per cent.

Mr. ADAMS: A turnover of only one. The average turnover of these 50,000 parts is less than one.

Mr. MILLIGAN: I was just thinking of the Cockshutt machinery I have. If you do not sell as many parts as you are today, is it not going to be more costly for me to buy a part for my equipment, if this trend continues?

Mr. ADAMS: If you have more and more parts which are not fast-moving, of course these have an effect on fast-moving parts, and ultimately the part will cost more. In this costing of a part, you must look at the whole panorama. You must look at the 50,000 parts we make and sell, and not just the fast-moving ones that these "will fit" people will make. We must make and carry them all, and it costs money to carry the slow-moving ones, as well as the fast-moving ones.

Mr. MILLIGAN: How many years has your old Smiths Falls plant been closed down?

Mr. ADAMS: It was closed in 1955.

Mr. MILLIGAN: Then you just have your distribution in the other plant there, for repair parts?

Mr. ADAMS: At Smiths Falls?

Mr. MILLIGAN: Yes.

Mr. ADAMS: We have a branch in Smiths Falls, yes.

Mr. MILLIGAN: Why did that plant close? Was it because of foreign machinery, or competition?

Mr. ADAMS: I suppose you could say that. We did not have sufficient volume to fill that plant, and we retrenched our manufacturing facilities and moved it to Brantford.

Mr. MILLIGAN: Would you have any idea how many people were employed at that plant when it was in full production?

Mr. TINKESS: Approximately 500.

Mr. MILLIGAN: I know it covered nearly a block. I have been informed it was being torn down because of the taxes being too high.

You mentioned the National Farm Machinery Company in the United States, to which you were supplying machinery. Why did your sales nearly disappear down there? Was it due to some policy the Americans have of controlling products made in Canada from being sold in another market?

Mr. ADAMS: I do not think they have any policy or they probably would not have begun marketing our products. I suppose you could say that it did not turn out to be a very effective way of merchandising farm machinery.

Mr. HORNER (*Acadia*): Are you talking about the National Farm Cooperatives of the United States not being an effective way of marketing farm machinery?

Mr. ADAMS: I was answering a question as to why their volume has slipped so drastically, and it would lead us to believe that there is something the matter in this method of distribution of farm machinery. I believe we had seven cooperatives at one time but now there is only one in operation in the United States.

Mr. MILLIGAN: I asked that question because in paragraph (b) of your summing up you mention the Farm Improvement Loans Act, and I think your suggestion is a splendid one. All of us have been told to buy Canadian, and I think we should practice that. I was wondering, was the United States

doing something along the same principle, since you referred in the brief to the fact that the sales dropped in the United States.

The VICE-CHAIRMAN: Have you many more questions, Mr. Milligan?

Mr. MILLIGAN: I have just one more.

Mr. ADAMS: I might add another point Mr. McCurdy has just drawn to my attention. The market changed considerably from that of a sellers' market to a buyers' market after the piled up post-war demand had been satisfied, and at that time the co-op faded as a merchandizer of farm machinery.

Mr. KORCHINSKI: I have a question relating to graph number V.

Mr. FORBES: Just a minute, Mr. Chairman. This morning when you introduced the witness I did not quite get the position Mr. Adams holds with the company, and that might make some difference. Mr. Adams, what position do you hold?

Mr. ADAMS: Market research manager.

Mr. FORBES: That is the same thing as a general manager?

Mr. ADAMS: No, it is not.

Mr. KORCHINSKI: My question has to do with graph number V. It shows that in 1954 your total exports and world sales were 49.9 per cent of all sales; and your exports to the United States were 24.8 per cent. Then I notice in your statement of profit that Cockshutt took a loss of 7.5 per cent in that year. From that I almost deduce the more exports you have the greater your losses are going to be. Would you care to comment on that?

Mr. ADAMS: I should like to consult the total sales figures for that year. In 1954 our sales in Canada dropped from \$26 million in 1953 to \$13 million in 1954. We must not miss the point that Cockshutt is essentially a Canadian manufacturer and relies for the greater part of its livelihood on Canada.

Mr. KORCHINSKI: But you do have quite a potential market in the United States. You have a fairly steady curve on the graph indicating that in the United States you have a potential market for roughly 25 per cent of all your sales. Could you indicate in what part of the United States this market is located? Is it in the eastern half of the United States or in the western half?

Mr. ADAMS: Principally in the northern half, which would tie in with the grain growing areas very similar to our own in western Canadian provinces.

Mr. KORCHINSKI: And where are your major sales made in Canada? I presume it is in the west?

Mr. ADAMS: The greatest percentage of them is in the west.

Mr. KORCHINSKI: And for that market you only have a plant in Brantford?

Mr. ADAMS: That is right.

Mr. KORCHINSKI: That your is your only operation in Canada?

Mr. ADAMS: At this time, it is the only one.

Mr. KORCHINSKI: Since the greatest proportion of your sales is in the west could you tell me would that be one of the considerations you might give to trying to build a plant closer to the market and thereby save transportation costs?

Mr. ADAMS: This is a problem of weighing the economics, of taking the raw materials to one place or another, or shipping the finished goods from one place to another. It is also a problem of capital investment.

Our company was founded some 122 years ago. It was situated in Brantford and since that time we have invested a good deal in it as a capital going factory. This is a problem should we want to go closer to the market. A third

factor is that there is a considerable trained labour pool in Brantford which has a knowledge of the making of farm machinery. Essentially it is a problem in economics. I am sure if there were a great advantage in it, and were it feasible, we should certainly be considering it.

Mr. KORCHINSKI: From where does your greatest competition come, from the manufacturers in the United States or from other manufacturers throughout the world?

Mr. ADAMS: That depends a great deal on the product. In combines it would certainly be other American manufacturers and Canadian manufacturers. In the business of the small diesel it would certainly be European manufacturers, and so I would say the whole situation is one of world-wide competition, depending on the product and the time.

Mr. KORCHINSKI: I think Massey-Ferguson indicated that something like 45 per cent of their sales was in tractors and I would imagine that would be something similar in your business?

Mr. ADAMS: I believe our largest proportion of sales dollarwise would be in harvester combines. About half of our sales would be in harvester combines and a third in tractors.

Mr. KORCHINSKI: If there is going to be a trend towards dieselization it will be cheaper to build diesel tractors. I cannot see why it will not be cheaper to build a harvester combine, though perhaps the cost of transportation will enter into it and therefore you will find there is nothing saved. Eventually you will reach a point where it will become too expensive for you to operate in Canada and you will have to branch out into other areas and other countries, much as we would dislike that. You would have to go elsewhere if you wanted to stay in business.

I notice in the *Financial Post* of October 15 that in order to increase its sales to the United States Cockshutt has gone into some land venture in Florida. I believe this is a subsidiary of your company, and I wonder how you relate that to increasing sales in your company?

Mr. ADAMS: I would like our president, Mr. Tees, to explain that to you.

Mr. TEES: I am perhaps better informed on that question. First of all, I would like to say that Cockshutt, like practically every other manufacturing company and many other types of businesses in Canada and other parts of the world, is faced with the problem of expanding or getting larger in order to exist. If you will observe the other competitive companies in the manufacturing field, you will find that the trend, the fashion, the economic necessity is this one of expansion. Expansion is necessary in order to buy facilities for engineering to keep up the complexity of the compound nature of the product. This requires capital. Capital is difficult to raise and expensive to raise. This Florida land transaction is essentially a method, and we believe a rather novel or good one, for the purpose of raising capital.

I think it will help the interpretation when I explain to you that the Florida land company is a wholly-owned subsidiary of Cockshutt; all of the shares of that company were purchased by Cockshutt. The payments made for those shares are shares of Cockshutt Farm Equipment Limited, but those shares of Cockshutt Farm Equipment Limited are in escrow, and unless the Florida subsidiary produces sufficient cash to pay approximately \$29 a share, the stock will never be released from escrow.

The effect of this is really an underwriting of stock on a contingency basis. If successful, we get the capital and they get the stock; if it is a failure, the stock is not released and returns to the treasury of Cockshutt. They have five years to do this. If it is successful, it will be an extremely economical method compared to investment underwriting techniques which vary in cost from a

small amount to quite a large amount, and particularly in not too popular industries with a large price ticket. This will be an extremely economical method of raising substantial sums for the purpose of this necessarily revolutionary expansion which is almost essential to stay alive and which, if successful, will make Cockshutt a stronger company, able to produce more efficiently. Companies that produce for efficiency usually put the end product in the hands of the consumer more cheaply. So it travels the full circle. We believe in the strength of the company and in the end use product being more efficient and more economical for the consumer. I hope this explanation was not too long-winded.

Mr. KORCHINSKI: That was very good.

The VICE-CHAIRMAN: For clarification I would say that this is explained on pages 12 and 13 of your annual report.

Mr. TEES: In order to assist you later, you may get a summary of that in our last statement which we prepare for our own shareholders.

Mr. KORCHINSKI: So that in essence this deal is more of a finance arrangement within the company, or, in other words, the method by which you will be able to provide finances, rather than with the intention of promoting sales? This is the question I originally put.

Mr. TEES: It is a method of increasing the capital of the company.

Mr. McINTOSH: Mr. Chairman, first may I draw the witness' attention to page 1 of the brief where it says:

May we refer you at this time to the audited profit and loss statement of the farm implement division of our company for the past ten years?

What other divisions are there, or what do you call divisions?

Mr. TEES: There is Brantford Coach and Body Limited, which is a wholly-owned subsidiary of the company, and this Florida land company, also a wholly-owned subsidiary of the company. I do not believe there is any other subsidiary of significance.

Mr. McINTOSH: Does this farm implement division include tractors?

Mr. TEES: Definitely.

Mr. McINTOSH: How about Bellevue Realty Corporation?

Mr. ADAMS: Bellevue is essentially a sales branch.

Mr. McINTOSH: How about Cockshutt Farm Equipment Incorporated at Bellevue, Ohio?

Mr. ADAMS: That is the same thing.

Mr. McINTOSH: From your consolidated balance sheet it appears you have two million shares at nominal value. What is the book value of those shares and are they on the market?

Mr. ADAMS: On page 15 appears the consolidated ten-year summary of financial data and in the lower statement, the third column from the right, you will find the book value per share between the years 1951 and 1960.

Mr. McINTOSH: Are these shares on the market?

Mr. TEES: They are listed on four exchanges in the world.

Mr. McINTOSH: On page 6 of your brief you say:

At Cockshutt we designed and costed a diesel unit of this class for manufacture in Canada—only to find it was more economical to purchase a model in Italy.

First might I ask whether the tractor manufactured in Italy was comparable in all respects to the tractor you have designed and costed here in Canada?

Mr. ADAMS: Yes, it is.

Mr. McINTOSH: Would you care to give an explanation as to why you found it was cheaper, in view of the fact that a great deal more transportation is involved in bringing the tractor from Italy?

Mr. M. H. McCURDY (*Director of Engineering, Cockshutt Farm Equipment Limited*): The only reason I can give for that is actually the lower labour costs in Italy. We costed it out very carefully some time ago, using an English engine, and we fought our hearts out to get that tractor made in Canada, because we wanted to try to make it in Brantford, and we could not make it economically.

Mr. McINTOSH: Some of the witnesses before us said that the actual labour content in any one machine had not increased over the past ten or 15 years—or very little, due to automation recently. Would you care to say how much cheaper you found it was to produce this tractor in England than it was in Canada, on labour charges only?

Mr. McCURDY: I cannot answer that question. I do not remember all the figures. It was nearly two years ago that I worked it out, and I do not remember them all.

Mr. McINTOSH: At the top of page 8 you say:

Nor does the farm machinery industry receive the “subsidies” so often decried by farmers when they discuss Canadian manufacturing.

Would you tell me what subsidies you are referring to?

Mr. ADAMS: Those received by other secondary industries over and above tariffs.

Mr. McINTOSH: Such as what?

Mr. ADAMS: For instance, these investment allowances which I understand shipbuilding companies have.

Mr. McINTOSH: In the same paragraph here you also say:

Legislative regulations, for example, impose on the industry the costly requirement of carrying repair parts for every farm machine for a ten-year period after its production has been discontinued.

In your opinion, is this too long, or do you think it should be reduced, or do you think farmers are entitled to be able to get repair parts for a machine which is ten years old.

Mr. ADAMS: This is provincial legislation in the province of Saskatchewan and other provinces. Actually, sometimes as a moral responsibility we have carried those parts for even longer than ten years—I mean as long as 20 to 25 years—to supply our customers, to satisfy them in service. I do not know if it is an unreasonable length of time. Certainly, in the case of many parts of which you never sell very many, it is a long time.

Mr. MUIR (*Lisgar*): Could I ask a supplementary question on that? Do you not feel that this very thing gives you over-all assistance in selling your product, the fact that you carry these parts? Does that assist you, when the customer knows he will be able to get the required part in ten years, when other manufacturers are doing the same thing?

Mr. ADAMS: Certainly it is good business to carry parts and service the customer. We firmly believe in this.

Mr. MUIR (*Lisgar*): May I get some further clarification on that and ask one more question? Would you agree that the reason for your percentage of sales over the comparable machine sold by C.C.I.L. is because of the better dealer setup, with more availability of parts?

Mr. ADAMS: I believe we have better coverage and do more servicing than, say, C.C.I.L.

Mr. MUIR (*Lisgar*): Thank you.

Mr. McINTOSH: At page 9 of your brief, you make reference to many interest-free notes. I think previous witnesses have made reference to high rates of interest, and so on. I was not aware that there were many interest-free notes that machine companies will receive. Could you tell me something about your policy in regard to this?

Mr. ADAMS: Most decidedly there are many interest-free notes going, from six months, eight months, sometimes as much as a year. These interest-free notes are requested of us and many companies give them and by competitive pressure we must also give them.

Mr. McINTOSH: You mean, in the off-sale season?

Mr. ADAMS: Sometimes in season, and oft times in the off season.

Mr. McINTOSH: At the top of page 10, you make reference to:

—a fact which provides the large American companies based in the Chicago and Milwaukee areas with the opportunity of clearing their fall stocks in Canada at sacrifice prices,—

I think this question was asked before. Have you any idea of the percentage of machinery that they dump—as you called it—in Canada in the off-season period? Or are any figures available on that?

Mr. ADAMS: We have none.

Mr. McINTOSH: You have none?

Mr. ADAMS: No.

Mr. McINTOSH: At the top of page 13, in referring to material costs, I think you interjected when you were reading this statement, to the effect that a large percentage of the cost is in material. Could you give us any idea of what percentage of material is included in the cost of any one article or any one machine?

Mr. ADAMS: Yes, more than half of the cost of the machine is material.

Mr. McINTOSH: Following that up, what percentage is labour cost in the machine?

Mr. ADAMS: I do not have that available as a percentage of the factory cost.

Mr. HORNER (*Acadia*): As a supplementary question, would you agree with John Deere Limited that where labour is involved in the production of material there has been a greater increase in those materials that you use? They produced a sheet of statistics showing, for example, that hardware has increased more than, say, pig iron, over the past ten years, as regards the cost of the labour component of it. They suggested to me when I examined them that diesel tractors, for example, had a greater labour component and that was why they had higher prices for diesel tractors than they had for gas tractors, and so on—that it took skilled workers.

Mr. ADAMS: Regarding the first part of your question, yes, the more labour in a part, the more costly it becomes, the greater the increase in cost from that source. Regarding a diesel engine, yes, the injection pump, and what have you, are very finely machined parts, and they require skilled labour at considerable expense.

Mr. McINTOSH: Regarding these figures of foreign machinery being sold in Canada—and I might say also in the United States—have you any figures on whether it is increasing or not? Could you show the trend by a graph? Is the trend the same in the United States as it is in Canada, and if it is the same

in the United States, can American production compete with this foreign trend; or are they faced with the same problem as you are faced with here in Canada?

Mr. ADAMS: As mentioned in the brief, with some of these products the large American concerns are importing.

Mr. McINTOSH: You mean they are importing rather than producing?

Mr. ADAMS: That is true.

Mr. McINTOSH: And the same trend applies to Canada, is that it?

Mr. ADAMS: The same is happening; but as for a trend, we think that imports are definitely increasing. I mean, we have stated that the trend with respect to Canada is that imports are increasing every year in agricultural machinery.

Mr. McINTOSH: The reason, I ask is that on the graph which shows labour costs, the United States is the only country higher than Canada; it was quite a bit higher, from \$2.25 to \$1.90 for labour costs, while the next highest was 86 cents, I believe. One would think from that graph that with the higher cost of labour in the United States they would have a larger profit than we have in Canada, which apparently is not the case.

Mr. ADAMS: This question of volume cannot be separated from that of cost. The American concerns have a much greater volume of machinery and it also depends again on the product about which we are talking. For instance, large combines, as was mentioned earlier, are not imported from Europe. In Europe they have not tooled up for them; whereas for the small tractor—this is a commonly used model in those countries and they have tooled for it and it is much more economical for them to sell it here.

Now, I would like to quote again from this August 20 issue of the *Financial Post*, where they are talking about tractors, and where they say that on the tractor part of their operations, tractors represented a big import, and that in 1958 \$117 million worth were brought into Canada, while during 1959, \$172 million worth were brought into Canada. The United States imports accounted for a large share, but in one year the European imports jumped from \$6 million worth to 15½ million worth.

Mr. McINTOSH: I would like you to elaborate on the statement you made this morning when you referred to accelerated depreciation for the farmers. Some members of the committee were very intrigued with the suggestion. Would you please explain a little bit more what you meant by that, and give us an example?

Mr. ADAMS: Well, we visualize this as follows: suppose a farmer buys a tractor in Canada. For instance, he would be allowed a write-off on his income tax of something greater than the cost, let us say 180 per cent, or twice the value of it, and he would depreciate on this larger amount each year, and thereby recover the cost of that machine at a faster rate. We feel this would help him substantially. We understand that the shipbuilding companies have applied for this in regard to their own investment. This is a kind of double-barrelled thing, which could be applied to the manufacturers' investment in tools, or which could be applied to the farmers' investment in machinery. We would like to see it applied to Canadian made goods purchased by the farmers.

Mr. HORNER (*Acadia*): Would it apply to your profits in any way?

Mr. ADAMS: We feel that such a thing would tend to increase volume.

Mr. HORNER (*Acadia*): It would not apply in any way to your own income tax?

Mr. ADAMS: No, no; this could be done quite aside from that.

Mr. HORNER (*Acadia*): What effect do you envisage it would have on second-hand machinery or on the price of second-hand machinery in a dealer's hands?

Mr. ADAMS: This is more rapid depreciation, but it would be commonly applied to new machinery. You might call it exaggerated depreciation. The value is still in the machine. It is more of a paper transaction to help the farmer than anything else.

Mr. KORCHINSKI: Why would it not have an effect on your income tax, since it would allow double depreciation and thereby give you a greater write-off?

Mr. ADAMS: It would give the farmer more of a write-off.

Mr. KORCHINSKI: Why would it not affect your company?

Mr. ADAMS: It would only apply on the product, in this instance on the tractor, which is purchased by a farmer. We would sell the tractor to the farmer, and he would write off the total on his income tax.

Mr. KORCHINSKI: We are thinking of different things. You would like this for your industry, would you not?

Mr. ADAMS: As mentioned in the brief, we would request it for our industry, just as the shipbuilding people have; but this is a double-barrelled issue. It may be that you would be more concerned, undoubtedly, with farmers, in this particular committee. But we did think it was a worth-while thing might be worth consideration for the sake of manufacturers in Canada.

Mr. MCINTOSH: It would be an incentive for the farmer to buy Canadian made products?

Mr. ADAMS: That is right.

Mr. MCINTOSH: Has this been done anywhere else in the world, to your knowledge?

Mr. ADAMS: I think it has been done in the United Kingdom, where they call it an investment allowance. There is a precedent for it.

Mr. FORBES: On page 2 of the brief you say:

We have attempted to calculate for your convenience what this return would be on retail or farmer sales dollars. You will observe that earnings amounted to only 1.3 per cent of retail sales over the ten-year period. As Cockshutt is essentially a manufacturer and wholesaler of the Cockshutt selling price to dealers and distributors.

Why do you measure your percentage on a basis of retail sales, when actually you do not directly benefit from retail sales?

Mr. ADAMS: That is entirely true. The reason for this was that we put this in the brief first because we thought you gentlemen were interested in thinking of it from the farmer's standpoint, I mean the farmer's sales dollar. That is what this 1.3 per cent average is. But as far as the company is concerned, we do not know what the dealer ultimately sells the product for. So we are thinking in terms of dealer selling price.

Mr. FORBES: Actually it is just a guess.

Mr. ADAMS: It is a guess, but we thought it would be one you would be interested in, even though it was a guess.

Mr. FORBES: On that same point, may I ask you what mark-up you suggest to the dealer? You suggest a price to him, do you not?

Mr. ADAMS: That is right.

Mr. FORBES: But what mark-up is that between the wholesale price and the price at which he retails it?

Mr. ADAMS: He gets a 20 per cent discount.

Mr. FORBES: This morning you referred to costs in connection with manufacturing and you used D.B.S. figures. Does your company not have figures of your own, without having to refer to some general D.B.S. figures.

Mr. ADAMS: To which figures are you referring?

Mr. FORBES: Figures in connection with labour.

Mr. ADAMS: I could quote our own labour rates. Actually the figure is above the figure I gave this morning of \$1.90.

Mr. FORBES: That is what we want to know. We want to know what it costs you to produce the machinery. We have had D.B.S. figures during the whole of this inquiry. We would like to have your costs.

Mr. ADAMS: I would be pleased to quote our labour rates to you.

Mr. FORBES: In other words, what you are going to give us now are the labour costs to Cockshutt.

Mr. ADAMS: Do you wish these with or without the fringe benefits?

Mr. KORCHINSKI: Give us both.

Mr. ADAMS: In 1950 the pay rate was \$1.25.

Mr. FORBES: That is labour?

Mr. ADAMS: Yes; that is the rate. The fringe benefits in that year amounted to 30 cents more an hour. The total hourly rate was \$1.55. In 1954 the rate was \$1.65, fringe benefits were 35 cents, for a total of \$2; in 1956, the pay rate was \$1.74, fringe benefits 44 cents, for a total hourly rate of \$2.18; in 1959, the pay rate was \$1.94, fringe benefits 58 cents, for a total of \$2.52. In the first six months of 1961 the pay rate was \$2.17, fringe benefits 61 cents, for an hourly rate of \$2.78.

The VICE-CHAIRMAN: Gentlemen, the witness has a complete list from 1950 to 1961. Would it be your wish to have that on the record at this time?

Agreed.

(EDITOR'S NOTE: For table, see following:)

COCKSHUTT FARM EQUIPMENT LIMITED

FARM IMPLEMENT DIVISION

Hourly Labour and Fringe Benefit Costs in Manufacturing—Cost per Hour

Year	Pay Rate	Fringe Benefits	Total Hourly Rate
1950.....	\$1.25	\$.30	\$1.55
1951.....	1.47	.33	1.80
1952.....	1.60	.34	1.94
1953.....	1.58	.34	1.92
1954.....	1.65	.35	2.00
1955.....	1.65	.36	2.01
1956.....	1.74	.44	2.18
1957.....	1.80	.46	2.26
1958.....	1.88	.48	2.36
1959.....	1.94	.58	2.52
	$\left\{ \begin{array}{l} \$1.94 \\ 1.25 \end{array} \right.$		1.55
	$\$.69 = 55.1\%$		$\$.97 = 62.5\%$
1960.....	2.09	.59	2.68
1961*.....	2.17	.61	2.78

* Six Months—November 1, 1960 to May 3, 1961.

Mr. HORNER (*Acadia*): Have you any idea of the fringe benefits paid in respect of these other wages in the other countries to which you referred?

Mr. ADAMS: I am sorry, I do not have them. I have heard the notion that they were low, but I have also heard the notion that they are very high; I do not know. You gentlemen may have more access to this information than I would.

Mr. FORBES: We have endeavoured to find out what it costs to manufacture some particular machines. Have you the cost price and the selling price which you would care to divulge to us in respect of any one machine? Do you know, for instance, what it costs to produce a combine?

Mr. ADAMS: We would hesitate very much to divulge this information, for the simple reason it would aid our competitors. In principle we would be pleased to give it to you, but this is very confidential information which could do gross harm to a Canadian manufacturer. We would wish that you would not ask us for this.

Mr. FORBES: Then, how do you suggest we can arrive at a decision as to whether or not your mark-up machinery is too high or too low? That is the purpose of this inquiry.

Mr. MCINTOSH: As another way of arriving at it, I wonder if you have any basic formula for establishing prices. Have you a basic formula which you use in arriving at selling prices or the return to you on any specific machine?

Mr. ADAMS: We take costs into consideration. As a rule, the final figure is based on the competitive pressure of the prices of the other manufacturers.

Mr. FORBES: In other words, after you have made a combine and you arrive at your price, you slip around and find out what Massey-Ferguson and International charge for their combine, and then you say yours is at about the same level.

Mr. ADAMS: We would take a little bit of issue at your suggestion of slipping around.

Mr. FORBES: I speak in a foreign language.

Mr. ADAMS: That is all right. Naturally we make much the same product. It is not the same; there are many differences. Essentially, however, it is the same beast. I imagine our own manufacturing costs are not an awful lot different to theirs. It would stand true that the ultimate price would not be an awful lot different to theirs; but there is no conscious effort to combine, so to speak, in setting a price. I think our profits clearly indicate the viciousness of this competitive situation. A 1.8 per cent return on sales is so little that there certainly is no profiteering.

Mr. FORBES: In other segments of our society, one might happen to have a cup of coffee with his opposition and discuss certain prices for certain commodities. Does that not happen in respect of the machine companies? Could Massey-Ferguson and Cockshutt not get together and say "this is what is wanted, this is what we have, and this is what we want"?

Mr. ADAMS: This is not the case. Personally I have been in on a cockshutt internal meeting when we decided to set the price. True, competition—what other people are charging—may have had some effect. It is the competitive pressure of price. However, there is no conclusion, as you would suggest. We are controlled by the price in the market place.

Mr. FORBES: And not the price it costs to produce it?

I would imagine that if there was competition, your price would be based on the cost of production, plus a reasonable mark-up. According to the evidence which has been submitted by the implement dealers and other manufacturers,

the dealer does not have to follow the suggested price you quote. Therefore, we have a two-price system: There is one price if you have cash, another if you have a trade-in, and there may be a combination of the two. Do you believe in that principle of doing business?

Mr. ADAMS: This principle is one that has grown up. We are not particularly enamored with this thing. These over-valued trades—you might call them that, if such a thing exists—obscure price competition. As I say, it has grown with us. What can be done about it?

The CHAIRMAN: Mr. Southam is next.

Mr. SOUTHAM: Mr. Chairman, we have had considerable testimony from previous witnesses and also heard from Mr. Adams this morning on the relationship of the Canadian productivity to the United States labour productivity. It has been mentioned here today on a couple of occasions, but I do not know whether we have explored this one problem. It may be an area wherein we could do something. Is our lower productivity of labour in Canada—and it is roughly estimated at around 30 to 32 per cent—directly related to the price of farm machinery in Canada? If so, how would it relate to machines manufactured in other places, other than Canada and the United States, and is this a factor in keeping our prices in Canada as high as they are? Are one of the factors the fact that we have not the equipment here in Canada—that is, the tools in our manufacturing plants; say, in your plant—to compete with the American labour productivity?

I understand volume is one of the factors, but there must be some other special reason. If so, what would you suggest that would eliminate this? 30 to 32 per cent is a great variation between the two countries which enjoy, more or less, the same standard of living, and everything else is pretty well equal.

Mr. ADAMS: Well, regarding the United States, Mr. McCurdy, our director of engineering, just informed me that he has travelled extensively through many factories there, and he does not believe that their productivity is an awful lot higher than our own, simply, I would imagine, from the volumes and the number of different pieces, and that type of thing. When there is one part that is the same and is used many times over, of course it is possible to do extensive tooling on it and, thereby, bring down the cost. This is not entirely the case the world over as, for instance, when we mentioned these small diesel tractors in the United Kingdom; certain parts of that—the engine, and what-have-you, are very highly tooled, and this, again, sets the price of that tractor, which is the price we must compete with on this side of the ocean. However, we do not have the tooling, and cannot do it.

Mr. SOUTHAM: You also say that possibly volume would be a big factor.

Mr. ADAMS: Very much so. You cannot separate cost and volume.

Mr. SOUTHAM: You see, there is this 30 to 32 per cent differential in the labour content, which is almost one third. That being the case, you would think that we should be able to attack that problem and, as a result, you, as a wholly Canadian concern, could enjoy the benefit of that lower wage rate here in Canada, as compared with the United States. It seems we are not getting it. Has there been a fair enough investigation into this angle?

Mr. ADAMS: As you can see, our wages are considerably higher than in these other places; in other words, there is a long way to go, and this means a tremendous capital investment to eliminate such portions, if you wish to call it that, to bring this type of thing into line, and it is just too much money for the volume.

Mr. SOUTHAM: You suggest, then, Mr. Adams, that due to the fact that we are a smaller country, with a smaller volume, you have not a large enough capital investment here in your plant to compete with this difference of labour productivity in the United States?

Mr. ADAMS: That would be your chief reason. Well, we do compete, which makes my agreeing with your statement erroneous. We compete at 1.8 per cent to sales profit. So, I could not agree with you. However, I would say it is very difficult to compete, with the small volumes. Automation is erroneous; it really does not exist. High labour costs, and probably these wages were set from those industries which could automate a great deal more than the farm machinery industries could. So, we compete, and the result is 1.8 per cent return on sales.

Mr. SOUTHAM: I have another question, Mr. Chairman, and it has to do with finance.

Do you people have your own subsidiary finance company? Apparently this is the pattern in other manufacturing concerns. I understand they set up their own. Mention was made today that you have quite a number of competitors, and that you give out notes without interest charges. Do you have your own subsidiary finance company, or do your customers deal with other companies?

Mr. ADAMS: No, we do not have our own subsidiary company. We do finance a certain amount—and when I say “we”, I mean the company itself. As I say, we do not have any subsidiaries. We do encourage the farmer to finance through the Farm Improvement Loans Act, or his bank, or the Commercial Credit Corporation. Some suggest other methods of financing. However, we are not overly enthusiastic about financing, because, simply, of the tie-up of the money. As we have demonstrated to you—and I think effectively—when you take into consideration the industry’s needs that are demanded of us, we end up with less than 3 per cent. You members know that we cannot borrow money at that rate. So, we would just as soon get out of it altogether.

Mr. SOUTHAM: The reason I brought up the question was that other witnesses had testified that they have their own subsidiaries, and I think their evidence was to the effect that they charged anywhere from 7 to 8½ per cent up to 11½ per cent. I was wondering what the percentage rate of interest was that your financing subsidiaries charge.

Mr. ADAMS: As I say, we do not have a subsidiary.

Mr. SOUTHAM: I note from what you said that you have not.

Mr. ADAMS: We do loan from our company itself, and the rate is 11½ per cent.

Mr. SOUTHAM: Also, I was interested in your discussion here, in answer to a question by one of the members, with regard to the blending or averaging of the price of parts to the farmer. Do you think that would be a field which we could explore, to see if there could not be some return to them; in other words, if a part is not required on a regular basis, I would assume that to keep it on the market would cost much more than a part which would be in demand every day. Would it be a fair principle to blend these prices? Would it not be better to explain to the customer that these parts which were in short demand are naturally quite a bit higher in price, and then give him the benefit of the lower price on the large volume of parts that are in demand every day? I might say that I hear complaints regularly about the pricing of repair parts to machinery. Could this principle be developed to a larger extent?

Mr. ADAMS: What you are suggesting is that we have an almost production cost on some parts and a really terrifically high price on others. Remember,

there are 50,000 parts, for which tools must be maintained. They must be warehoused and domiciled in the different regions. They turn over less than once a year. I think what you are suggesting would get us more black eyes than trying to spread the cost and looking at this whole situation as—

Mr. SOUTHAM: I would think, from talking to the farmers—and I live in a small town where we have several machinery companies representing that area—you would get fewer black eyes if you kept these basic parts which are in everyday demand to a fair or moderate price. There are a great many complaints coming in, in respect to the cost of these parts which are in everyday demand, and I am wondering if you are following the right principle. I noticed that you enunciate that in your answer. However, it is a suggestion I throw out.

A further question has to do with your consolidated summary of financial data at page 15. In looking over the number of employees in Canada from 1951 to 1960, I notice that the high point was in 1952, when you had 4,502. In 1960, you had come down to 1,621. Do these figures indicate your salaried and hourly staff workers, and does it also infer that through automation and technology you have been able to cut your staff and yet maintain your productivity as far as your plant output is concerned?

Mr. ADAMS: These are consolidated figures. I would rather quote to you the numbers of employees in our farm implement division, if that is satisfactory. In 1954, in the farm implement division, we employed 1,821.

Mr. SOUTHAM: Does that include your salaried and hourly wage workers?

Mr. ADAMS: It includes all salaried and wage-earning people, in total.

Mr. SOUTHAM: Did you answer to Mr. Forbes a while ago, in reference to the increase in hourly rate wages from 1954 to 1961 include your salaried and hourly workers?

Mr. ADAMS: No. Those wage rates given were manufacturing wage rates of production workers.

Mr. SOUTHAM: Thanks, Mr. Chairman; that is all I have for now. I may have a question or two later on.

Mr. MUIR (*Lisgar*): Mr. Chairman, my first question is supplementary to Mr. Southam's. What percentage of your sales do you finance?

Mr. ADAMS: I will try to have that answer for you in a minute, as we do not have that calculated out at the present time.

Mr. MUIR (*Lisgar*): Perhaps I could carry on while you are looking up the answer.

Mr. ADAMS: If you would.

Mr. MUIR (*Lisgar*): On page 10 you say:

It might be claimed that Canadian-produced farm machinery could be sold in the United States without difficulty. This is not so now, and never has been.

That is what you said in your brief. However, you may remember that the Canadian combine took quite a substantial share of the American market not too long ago.

Mr. ADAMS: This was a very great technological improvement. It is the self propelled combine of which you speak?

Mr. MUIR (*Lisgar*): Yes.

Mr. ADAMS: There may have been three years of great success following on the concept of this new machine, but I understand from the Massey-Ferguson people that it did not last beyond three years.

Mr. MUIR (*Lisgar*): That is true, to some extent, although they still have quite a combine market.

Mr. ADAMS: I think this great splurge was due to the innovation of a self propelled combine and the technological improvement. Increased productivity for the farmer, and what have you, may be attributed to that machine.

Mr. MUIR (*Lisgar*): I think you will agree with me there is some advantage in reaching the market with the most modern machinery?

Mr. ADAMS: Definitely.

Mr. MUIR (*Lisgar*): Do you have the facilities for engineering and research to keep up with or get ahead of the market?

Mr. ADAMS: In answer to that, may I say that a number of years ago we were the first company to introduce the live power take off on tractors, but since that time I would have to confess there have been no striking improvements, at least as striking as a self propelled combine, come from our company. We do our best in engineering, but we definitely do not have the facilities of the larger companies and cannot spend the money they can. That is factual.

Mr. MUIR (*Lisgar*): In your first recommendation you refer to income tax relief on domestic sales for Canadian farm machine manufacturers. That, of course, would be an encouragement to Canadian farmers to buy Canadian make machines, but in your second recommendation you refer to amendment of the Farm Improvement Loans Act to provide for some financial encouragement to farmers to purchase Canadian made machines.

I think you will agree with me that once the farmer borrows money it is his own money, and it may not be in his best interests to be forced to buy some machine he would not prefer. He may prefer a foreign-made machine and he is actually spending his own money. I do not see how we can ask for that type of legislation which would keep him from spending what is his own on the type of machine he himself prefers.

Mr. ADAMS: I stand corrected on that through limited knowledge, but I know of no other instance where the Canadian government subsidizes imported products.

Mr. MUIR (*Lisgar*): This is not actually a subsidy. It is a provision for a farmer to borrow money so that he can operate more efficiently.

Mr. ADAMS: That is true, but it is providing him with an opportunity to help finance an imported machine.

Mr. MUIR (*Lisgar*): He may prefer it that way, and it is his own money. I think in this particular case we are going a little bit beyond the line of good reason in stipulating to the farmer that he must spend the money he borrows under the Farm Improvement Loans Act, which is only 10 per cent guaranteed by the government, to buy Canadian made goods.

Mr. ADAMS: We would leave that to your judgment, and all we do is draw it to your attention. We do not wish to belabour it.

Mr. MUIR (*Lisgar*): I think your first recommendation in paragraph (a) relating to income tax relief certainly would encourage farmers to buy Canadian farm machinery. That would do you a great deal more good than to try and force the farmer to spend money which he has borrowed from the bank on Canadian machinery.

Mr. ADAMS: I would agree wholeheartedly.

Mr. HORNER (*Acadia*): I have a supplementary question relating to the first recommendation. Surely it would only account for those farmers who

are well enough off to pay income tax, who are in that tax bracket? I would agree with the recommendation, that it is important to farmers who are paying income tax.

Mr. ADAMS: We would hope the farmers, as well as everyone else, will eventually become profitable operators. To be healthy they must be profitable to some small extent.

Mr. HORNER (*Acadia*): I think we should direct our efforts to those who are not now paying income tax. In other words, I believe the government should direct its efforts towards the welfare of small farmers and not towards those who are paying income tax.

Mr. ADAMS: I think this is debatable.

Mr. MANDZIUK: I have a supplementary question.

Mr. MUIR (*Lisgar*): If it is supplementary, then go ahead.

Mr. MANDZIUK: Without giving your recommendations too thorough a study, is it not their aim to improve your financial condition rather than to help stabilize farm machinery prices, or even reduce them?

Mr. ADAMS: The first item, as I explained, is only half there. The other half is the half we have been discussing, the investment allowance for the farm operator. Regarding the others they would have to do with the health of our company's Cockshutt farm equipment.

Mr. MANDZIUK: You are more concerned with your own financial foundation?

Mr. ADAMS: I would not say that is a fair statement, and let me tell you why. Again, there are the 50,000 repairs parts that we should like to make available. We should like to stay in business, and this means we should like some assistance. We believe it is of definite benefit to the farmers that we should stay in business. We believe we have products which are good ones, and I do not think anyone would deny they have been found acceptable and very satisfactory. As I say, we should like to stay in business and this would help us. In that way I suppose you might say it is a selfish interest on our part.

Mr. MANDZIUK: Mr. Chairman, I have just one additional question. In a sly way, are you not asking for protection without coming out in the open, though possibly that is not the correct word to use?

Mr. ADAMS: I would refer you to page 14 of our brief, where we state we are not recommending the reimposition of the tariff on farm machinery.

Mr. MANDZIUK: I shall correct that word to subtle—subtle not sly. When you recommend a dumping duty on manufactures coming in from the United States after a certain date, is that not protection for your own products? I do not mean protection for your own company, but protection for Canadian manufacturers. I presume this covers I.H.C. who manufacture in Canada. You do not exclude them?

Mr. ADAMS: We would want this protection for all machines manufactured in Canada. They employ Canadian labour and they pay Canadian taxes.

Mr. MANDZIUK: You are asking for certain protection?

Mr. ADAMS: We are suggesting this might be considered by the committee.

Mr. MANDZIUK: We are going to consider all aspects, but I want to understand clearly just what you are suggesting.

Mr. ADAMS: We are suggesting investment allowances for the farmer.

Mr. MANDZIUK: Why?

Mr. ADAMS: We are not denying it would benefit ourselves, if the farmer chose to buy Canadian, and we have suggested this other loan be restricted to the purchase of Canadian made goods, but that would be up to you people.

Mr. MANDZIUK: That would help you?

Mr. ADAMS: It would help increase our volume and provide a healthier situation for the farmer.

Mr. MUIR (*Lisgar*): If I may return to the question I asked previously, have you an answer regarding the percentage of sales which you finance?

Mr. ADAMS: About 25 per cent to customers.

Mr. HORNER (*Acadia*): Mr. Chairman, I am interested in this price setting idea. Massey-Ferguson, when they were before the committee, as much as said they asked as much as they possibly can get for their machinery and still sell it. In another brief presented to the committee, a professor who made a particular study of this industry said it was his belief that companies charged all the market will bear. I do not know whether he said it or not, but it was in his brief that certain companies over the years have been the price setters, and when those companies set their prices the others seem to fall in line, generally speaking, and follow suit. Do you agree with that statement, and has this been the pattern generally?

Mr. ADAMS: I would say that when our competitors have labour increases, material cost increases, and all the other various cost increases, including freight rate increases and tax increases, they generally occur at much the same time for all companies, and it would be a logical conclusion not to expect any great divergencies in the whole panorama of costs and prices. I would not expect one to go down and the other to go up at the same time.

Mr. HORNER (*Acadia*): Would costs vary to some extent according to volume? For example, did your volume of sales increase when Cockshutt introduced the live power take-off on tractors? Did that cause an increase in the sale of your tractors at that particular time?

Mr. ADAMS: I believe at that time there was a sellers' market, and there was such a demand that the market could not be satisfied.

Mr. HORNER (*Acadia*): Therefore you were not interested in reducing prices?

Mr. ADAMS: We did not notice any effect on sales.

Mr. HORNER (*Acadia*): But to some extent it is an accepted theory that companies watch their competitors' prices, and if competitors increase the cost of a machine by \$50 to \$100 and do not lose sales over it, the rest follow suit. Is this something that would go on in the business?

Mr. ADAMS: I shall be frank with you. We certainly watch what our competitors price their products at, due to the competitive nature of the marketplace. I think all Canadian and American industries are experiencing this, and I believe they will experience it more from the European common market. Harping back again to the small diesels, they are the ones who are setting the prices and we cannot make those machines at Brantford because of world-wide competition. It would not do us an awful lot of good to sit back and say: "Look what some other person on this continent is doing". These are the people who are setting the prices.

Mr. HORNER (*Acadia*): But I suggested to another group, and I hope I did not use your company's name in vain, that Cockshutt at one time had tried to reduce prices in order to increase their sales. I thought they might still be doing this to some extent.

I suggested that Cockshutt at one time had tried to reduce prices in order to increase their sales. I thought they might still be doing it to some extent. However, the Canadian labour congress said this is all foolishness and that none of the companies tried to reduce their prices—they all set their prices and kept to them.

Mr. ADAMS: I would say that we have attempted to increase our volume.

Mr. HORNER (*Acadia*): By reducing prices or keeping your prices a little lower?

Mr. ADAMS: On a number of our machines our prices are lower than those of our competitors.

Mr. HORNER (*Acadia*): The very fact that you imported the small diesel shows that you are trying to keep your prices below other companies to increase your volume. Your baler sells for a couple of hundred dollars less than some of the bigger manufacturing companies' in Canada.

Mr. ADAMS: We import and sell our power take-off baler at much the same price as our competitors.

Mr. HORNER (*Acadia*): Is your take-off baler for baling straw or hay?

Mr. ADAMS: It will work with both.

Mr. HORNER (*Acadia*): You said "low density", what did you mean by that?

Mr. ADAMS: This is a newer concept in baling. It wraps the hay; it does not give it that compressed and compact bale that is the usual kind today. The idea of this is to preserve the nutritional contents of hay. Where this improvement shows up is in greater production of milk.

Mr. HORNER (*Acadia*): I am not interested in cows at this particular time. I am led to believe that Cockshutt has two types of balers on the market. Is the second type a round or a square baler?

Mr. ADAMS: Rectangular.

Mr. HORNER (*Acadia*): And yet they are rolled?

Mr. ADAMS: They are wrapped.

Mr. McCURDY: Which makes it pack like the binder.

Mr. HORNER (*Acadia*): Something like the Welger baler that comes behind combines.

Mr. McINTOSH: Mr. Chairman, before Mr. Horner leaves the question of volume and costs, I have a supplementary point which I would like to ask. Do you want me to hold it until later?

Mr. HORNER (*Acadia*): I am not through.

Mr. McINTOSH: Are you through with volume and cost? If you are not, go ahead.

Mr. HORNER (*Acadia*): I got to the baler because I was under the impression that the baler you make in Canada sold for a lot less than in the United States. I was thinking particularly of one baler I own myself, a Massey baler, and I had a pretty strong belief this was so.

I have another question with regard to this particular baler you made. Does C.C.I.L. sell all your machinery or just the tractors?

Mr. ADAMS: No, it sells combines and tractors as well as swathers and mowers.

Mr. HORNER (*Acadia*): Why did you not include the baler; is it because they will not buy it?

Mr. ADAMS: I explained that before. We do not manufacture that baler at Brantford.

Mr. HORNER (*Acadia*): Where do you manufacture your other baler?

Mr. ADAMS: We import both our balers.

Mr. HORNER (*Acadia*): One from the United States and the other from France, I believe. I would like to read you something from Mr. Phillips' book on *The Agricultural Implement Industry in Canada* on page 121. A series of

questions had been asked and he is quoting from the 1937 price inquiry. He asks a question of the Cockshutt company at that time and I do not know who the questioner was.

Q. What were the reasons which induced the Cockshutt Company to increase prices in January of 1936?

A. I am not going to argue that materials cost . . . or labour costs were factors in that advance. I am not so sure about burden. I think that was not.

Q. You do not join with International Harvester Company and Massey-Harris in asserting that?

A. No, I do not . . . I am quite frank to admit that in the main we wait until our competitors, our large competitors, come out; and then we might have to adjust our prices a little way one way or another, not very much.

In all fairness to the Cockshutt Company, I would like to tell the committee that I could not find this exact quotation in the 1937 inquiry, but I did not read it all. It was in this particular publication as quoted from the inquiry so it may well be in that thirteen hundred and some pages. Here is evidence that in 1937 Cockshutt waited for the competitors to announce their prices and then followed suit one way or another. You agree that this is not the case today?

Mr. ADAMS: This took place a long time ago, in 1937, and I will submit to you that most of the people who were concerned with it at that time have since departed. I do not think I will have a comment on that.

Mr. HORNER (*Acadia*): I have one further question on this price-setting idea. You say, on page 6 of your brief, that farmers benefit from world wide competition. What could you say to substantiate that statement? There has been some doubt in my mind—and I do not know whether other members of the committee share this—that farmers do not benefit as much from world competition as they might because of price setting arrangements by some of the big companies. What evidence have you got to substantiate that statement on page 6?

Mr. ADAMS: Firstly, I would refer you to the small diesel which has taken over a good 20 per cent of the total number of tractors sold in Canada. This is over 5,000 units a year.

Mr. HORNER (*Acadia*): From what country would they be coming besides Italy?

Mr. ADAMS: The majority come from the United Kingdom.

Mr. HORNER (*Acadia*): This substantiates my own belief; but are the farmers feeling the effect of those reduced prices? I have before me the official tractor and farm equipment guide given to the committee by the Canadian federation of farm equipment dealers. In this guide they give the suggested retail prices by the various companies. The interesting thing that I would like to read out to you is that Renault—is that the correct pronunciation?—Renault tractors in horsepower rate all the way up to 36 horsepower according to the drawbar and have a retail price of \$1,788. I am referring to a small three-cylinder diesel tractor. For example—and I do not want to have the committee feel I am condemning one line of companies in my questioning—a major company which does a lot of manufacturing—in Great Britain, I will not mention their name—has recently bought a couple of tractor plants. They sell a three-cylinder diesel tractor in Canada but for nowhere near that \$1,700 price. It has been my belief that their manufacturing costs are somewhat close to the one I have suggested, but their price is nowhere close to the Canadian farmer. That is the point; that while Cockshutt may not be guilty of this, and I do not think they are—

Mr. ADAMS: I can say that we do not make any excessive profits on tractors we import.

Mr. HORNER (*Acadia*): I do not think that in this particular book the tractor you import is listed, because I imagine it is a recent policy carried out by your company, but could you give us some idea as to what would be your suggested retail price to your dealer on the Canadian market?

Mr. McDONALD: \$2,995. fully equipped.

Mr. HORNER (*Acadia*): This is considerably more than \$1,700. Is it a three or a four-cylinder diesel?

Mr. McDONALD: A four-cylinder diesel.

Mr. ADAMS: Thirty-six horsepower.

Mr. FORBES: Is this the same tractor that C.C.I.L. are importing from Germany this year?

Mr. ADAMS: They are selling a Deutz tractor.

Mr. FORBES: How does this compare in size?

Mr. ADAMS: It is many times larger. It is 50 to 60 horsepower.

Mr. PASCOE: In regard to the small diesel tractor, you say, on page 5, "the prevailing prices are those dictated by farm machinery prices the world over", and then you talk about the small diesel coming in and taking the market. Why would they come in if the prices are pretty well the same?

Mr. ADAMS: Competition is setting prices the world over. It is a world wide price competition. I believe this is the same tractor that is sold in large quantities throughout Europe, the small tractor. Its manufacture is very well automated and they can produce it at a smaller figure than we can here.

Mr. PASCOE: But you say your prices are dictated by world prices?

Mr. ADAMS: Could I answer you again? The competitive prices of similar American diesel tractors in that horsepower class are, I believe, higher, in which case the farmer is benefiting from this world wide competition. I know that we could not make one to compete with this. I would suggest the American prices on this size of unit are higher. As I say again, the farmer benefits from this. This is a world wide competition of prices.

Mr. BOULANGER (*Interpretation*): What would these 5,000 tractors we import represent in man-hours or man days' work in Canada?

Mr. ADAMS: I do not know that.

Mr. BOULANGER (*Interpretation*): You do not know how many hours it would take to produce a tractor?

Mr. ADAMS: No, unfortunately.

The VICE-CHAIRMAN: Are there further questions?

Mr. MILLIGAN: You mentioned that you buy Italian tractors. I notice it is 51 cents an hour. Did your tractor sell for less money than the tractor made in Britain and distributed by another company here, or would you sell that tractor produced in Italy at a such smaller price than that for which it is sold in some other European country?

Mr. ADAMS: I think volume is your answer. I did not quite get your question.

Mr. MILLIGAN: The question I was asking is: does the tractor you are selling here in Canada and that is made in Italy sell for less money than a light model made in Britain and distributed by some other company?

Mr. ADAMS: I believe our selling price is about the same.

Mr. McDONALD: Actually it so happens that those manufactured in Britain are exposed to a much wider distribution, larger volume, larger quantity, than the machine that we export.

Mr. HORNER (*Acadia*): To sell for less?

Mr. ADAMS: No, they sell for about the same price in this country. I am referring only to the price in this country.

Mr. HORNER (*Acadia*): Then it is due to the volume?

Mr. ADAMS: Yes.

Mr. HORNER (*Acadia*): In this particular line, this is the only thing you have in which farmers are benefiting from world-wide competition of recent years? This small diesel is coming in and underpricing some of the Canadian and American made tractors? Is this evident in the case of any other machines, to put it that way?

Mr. ADAMS: Not at the present time.

Mr. HORNER (*Acadia*): You hope, with your baler.

Mr. ADAMS: Mr. McCurdy says there is no indication that this particular baler is in such volume as will put it at a lower price. We would suggest, also, that at this time there are a number of combine manufacturers who have tried to market and are marketing combines in Canada from Europe. The Class combine comes to mind. You gentlemen would know them better than I do. I do not believe that they have found it too profitable a market. I do not know.

Mr. MUIR (*Lisgar*): Would not the reason for that be the same reason as in the case of your finding it difficult to sell in the United States, that the Canadian farmers like a particular type of combine and not one that looks, shall I say, like a German one? I think it is the design more than anything.

Mr. ADAMS: That is the consumer preference.

Mr. MILLIGAN: Why would you bring in this baler if it does not compete in price?

Mr. McCURDY: Actually, the reason we brought in the baler was to test the market for the low density baler, to see if it was going to be of benefit, and if it would sell. It is a low baler, like the other.

Mr. ADAMS: Actually, it is all something that gives benefit to the output of the cow, it preserves more calories and more nutriments in what the cow eats.

Mr. HORNER (*Acadia*): How many dealers has Cockshutt got in Canada?

Mr. ADAMS: Seven hundred.

Mr. HORNER (*Acadia*): That is including C.C.I.L. You had some trouble, I believe, with your dealers in 1950 when you started to sell to C.C.I.L. Is that not true?

Mr. ADAMS: Well, so far as to say that some of our dealers complained, yes, undoubtedly.

Mr. HORNER (*Acadia*): Since that time, have you not gone out and given your machines to local merchants to sell, without requiring that merchant to stock repair parts to any extent?

Mr. McDONALD: It would not be common practice to do that. It would be difficult for me to say that it never happened.

Mr. HORNER (*Acadia*): It is not a common practice, but it might have happened?

Mr. McDONALD: Yes.

Mr. HORNER (*Acadia*): I read from between the lines that you do not like to have to do this, but sometimes you might have done it.

Mr. McDONALD: Let us say that it has not been done with intent.

Mr. HORNER (*Acadia*): With intent of what?

Mr. McDONALD: To set them up without parts.

Mr. HORNER (*Acadia*): I see; but you have had trouble in losing dealerships to some extent?

Mr. ADAMS: No, I would not say this is a matter of losing dealerships. We have undergone an intensive dealer training program and we have tried to weed out those dealers who did not provide the farmer with adequate service, adequate stocks, and so on. This has been an upgrading going on all the time. In fact, in 1954 we had a larger number of dealers than we have today.

Mr. FANE: You say that in 1954 you had \$2,005,000 deficit. Did you actually make that much less money than you spent, or is that just a book figure? The same applies for the other years?

Mr. ADAMS: Our bookkeeping underwent no drastic change over other years, in the year 1954. It has been consistent throughout with normal auditing and accounting practice. Therefore, this would be a figure which would fit into this pattern of years.

Mr. FANE: You actually then went into the red in those years?

Mr. ADAMS: That is correct.

Mr. HICKS: I am interested in the sales in the United States by the Cockshutt people, and I am wondering if the United States farmers are a little bit more patriotic and want to buy United States machines, or are they a little doubtful about the quality of Cockshutt, or are they scared that probably they could not get repairs if they want them? What would you say of those three reasons is the most logical?

Mr. ADAMS: I would say, sir, that our quality has never been doubted.

Mr. FANE: I qualify that, in recent years.

Mr. ADAMS: Mr. Fane would qualify that, "in recent years". I am not quite prepared to do that. Regarding the other two reasons, we have been in business for 122 years. During that time we have supplied repair parts. It could well be that we are not known, and I believe this is the case in these areas. There may be some feeling or thought that we are fly-by-night. I could not say that when one has been in business for 122 years it is a fly-by-night concern. However, this is a problem of breaking into the market of which we speak. The name must be put across, together with the reputation, the reliability, and so on. I do not think there is any denying that in any product the Americans have been very patriotic in buying their own machines. In fact, we would very much like to see this same kind of thing in Canada, to be frank about it. This has been the case, so I think it would be hard to, shall we say, assign percentages to your thoughts. One is a problem of education, of the name of Cockshutt, the reputation, reliability; the other is that of overcoming the resistance of national thought.

Mr. HICKS: What do you think about the cost of machinery repairs and service? Could it be reduced by a smaller number of machinery dealers, say, in one of our provinces, with quick shipments, and this test, and fewer dealers—or is that an advantage or disadvantage?

Mr. ADAMS: We attempt to stock our dealers on a stock-order program at the commencement of each year so that they will have these parts available. We attempt to do this with timing such that these quick air freight shipments, and so on, which we make and for which we as a company bear the cost, will be eliminated as far as possible. I do not know if an awful lot more can be said. We attempt to organize our parts distribution very much. We have made quite intensive efforts, with our company, the branches and the dealers in this respect, and by eliminating these rush jobs we hope to keep the costs and the prices in line.

Mr. SOUTHAM: This is a very interesting area, in regard to the supplying of parts and service. Has there been any plan or concerted effort by your

company, or by any company you know of, to try to create an incentive to the farmer, through the organizing of a campaign prior to the harvest season, to get the machines into the dealer during that time, to see what the need is for repairs and parts; and on the basis of that is there any incentive reduction in price?

Mr. ADAMS: Most definitely I can quote to you a specific example of this. In one of our outlets we had a pre-season tractor tune-up, as we call it, for a special rate under which our people would go over that unit and try to get the implement ready for spring work. Now we are making it a policy in many instances to encourage this off-season work. Not only does it help the farmer, but it also helps the dealer in his facilities.

Mr. HICKS: And the unemployment situation.

Mr. SOUTHAM: I think this is a field or area where we could, perhaps, recommend as a committee that all companies in the farm machinery and equipment business should have a campaign to encourage this type of plan, to induce farmers to get repair parts and on the basis of that they should get as a reward a lower price.

Mr. ADAMS: This is very sound because it helps not only the company but the farmer and the dealer. The dealer does not want to find he has his shop tied up and that there is no work in it except at the peak season. That puts him in a bad position. This is a very sound plan which has been suggested, and we are 100 per cent behind that. Our service manager has laid out schemes along this line to try and get pre-harvest work done.

Mr. HICKS: Could this be tied up with a testing station? There is one in Saskatchewan, I understand, and I presume you have your own testing station—possibly the very thing we are talking about.

Mr. ADAMS: I think I could be specific again on this point, in regard to this tractor tune-up I mentioned. We had supplied a site, with a dynamometer to tune this man's machine up, and in that sense to do the testing to put it in top condition for his work. Sliding back to other testing, the A.M.A. in Saskatchewan test machines which have already been produced and we certainly go along with them there. Then there is this field of testing prior to putting a product on the market. This is where the prime interest of the manufacturer must lie. We do extensive testing, as much as time and money permit, on our machines before they reach the market. We try to ensure to the farmer that he gets a good machine.

Mr. HICKS: On the old question of standardization or new models, are you keeping them within bounds, or are you making a new model every year?

Mr. ADAMS: We certainly do not make new models every year. In fact, I will be frank about it, we could not afford to do so. I have heard about this idea of planned obsolescence. As far as we are concerned, we shudder at the thought of it. It involves very large capital investment, a change in parts, it adds to that 50,000 number of parts we have been talking about, for a number of years, with inventory charges and all the rest of it. We bring out a product to keep up to date, to help the farmers' productivity.

Mr. MANDZIUK: Mr. Chairman, would the witness give us an answer in a nutshell, in a few words, to a question which is the concern of this committee? Why are the prices of farm machinery as high as they are? That is the question in the mind of every farmer in the east, the west and every part of Canada. And why are they going up?

Mr. ADAMS: I would say to you that first of all we cannot agree that they are unduly high in the light of the cost increases, in wages, steel and prices. We cannot agree that they are unduly high.

Let me stand in front of this chart. If you look at the other side of it, you will see the prices of farm machinery and the increases, and these are the costs which go into it. May I suggest to you that we do not pretend to tell anybody his business; but when you look at this side of the graph you will see the prices and the farm incomes, both gross and net. May we suggest that a portion of your problem, at least, lies in this half of the graph.

Mr. BOULANGER (*Interpretation*): Are these graphs to be reproduced in our minutes?

The VICE-CHAIRMAN: I understand that they are.

Mr. MANDZIUK: Would the witness describe the costs or the contributing factors in the increase in farm implements in the order named?

Mr. ADAMS: These are in the order of increase.

Mr. MANDZIUK: Are they in that order with the contributing factors in the rising costs of farm machinery, such as the rising cost of labour and the rising cost of material?

Mr. ADAMS: I would have to say to you that there is no order, and let me explain why. As I said before, while over half of the cost of a farm machine is in material, when I say material I mean purchased parts, raw steel, foundry castings and so on. Now, there are various degrees of labour and material mixed up in the purchased parts, for example. They have gone up considerably, and labour is no doubt a factor for that. There is also the factor of labour in the preparation of the raw steel and in the assembly of the machines, so I would be unable to provide an order to this thing. I would suggest that there are increases labour-wise in purchased parts and other material, and in labour to make the parts and to assemble the machine.

Mr. MANDZIUK: This is a somewhat different question. We have had some evidence given that the number of wage earners in the implement factories has decreased, while the number of salaried people has increased. Is that a fact in your concern? We are not asking for numbers. We do not want to pry into your secrets or to let your competition into something. But is that the case?

Mr. ADAMS: To no great extent; there has not been that great a change. Supervision or salaried people have not gone away up and labour away down.

Mr. MANDZIUK: But in the number of salaried people in your manufacturing establishment for farm machinery the number of salaried people has gone up while the number of wage earners has gone down?

Mr. ADAMS: The number of employees in supervision in the factory has remained within three people—it has remained the same from 1954 to 1960.

Mr. MANDZIUK: While the number of wage earners has decreased?

Mr. ADAMS: Decreased, yes, but not sizeably in relation to the over-all picture; but they have decreased, yes.

Mr. MANDZIUK: One more question and I shall pass. I know that the people most concerned with the purchase of farm implements would like to know why you cannot manufacture a diesel tractor such as you import from Italy—that is, why you cannot afford to manufacture it here in Canada? What is the reason for it? You have the materials and the know-how. Can you answer that in a few words?

Mr. ADAMS: We designed it and put it together and costed it, and found that we could not do it.

Mr. MANDZIUK: Why? That is what the farmers want to know.

Mr. ADAMS: Because it cost us too much money, that is why. The long and the short of it is that it cost us too much in material, and too much in labour.

Mr. MANDZIUK: Thank you.

Mr. FORBES: I have one supplementary question. Let us suppose it cost you \$1,200 for labour and material for one piece of equipment. Would your mark-up be 20 per cent, and would your agent put on another 20 per cent mark-up? Is that approximately correct?

Mr. ADAMS: No, when we take a mark-up, we have in mind the earnings that the dealer receives, and it is on the suggested retail price, and it is 20 per cent. The other figure you spoke of is built up on the factory cost, so these two do not line up.

Mr. FORBES: You have a basis for a mark-up on the manufacture of any article?

Mr. HORNER (*Acadia*): I think what Mr. Forbes is referring to is this: you take off something for the good name of the Cockshutt Farm Implement Company in respect to the sale of this Italian company's Fiat, because you give them service, and your wide distribution system, and at \$700 you are not doing it for nothing. In other words, you charge a mark-up on the tractor they are selling in order to cover the good name of the Cockshutt Company and in order to allow them, in a sense, to use your dealerships which you have established and developed.

Mr. ADAMS: Surely we add to our imported cost to distribute it and to back it up with service.

Mr. HORNER (*Acadia*): That is the point. What you do is to add to this distribution cost.

Mr. FORBES: I was thinking of the Fiat tractor, of which you stated the price to be \$2,795. You stated that your dealer gets a 20 per cent mark-up, and I assume your mark-up is also 20 per cent, which would make the cost of the tractor to you \$1,675. How far out am I on that?

Mr. ADAMS: I am unable to answer that.

Mr. MILLIGAN: I am concerned about farm tractors which come in, because they put a lot of people out of work. How much are you saving today by importing such a tractor in comparison with a tractor you could have made here in Canada?

Mr. ADAMS: A tractor we could have made in Canada would not have been competitive, price-wise.

Mr. MILLIGAN: Could you give us an idea of the figure at which it might have been made in Canada, or rather as to what difference there would be?

Mr. ADAMS: It would be somewhere in the neighbourhood of \$400 to \$500.

Mr. MILLIGAN: You said that volume makes a difference in price. Are you saving anything by bringing these tractors in and paying the extra price for these machines, whereby with a volume of tractors you might be able to keep the price of other machines level?

Mr. ADAMS: I would say there are many machines we have in our line which do that.

Mr. McCURDY: The number we sell would not affect the cost.

Mr. MILLIGAN: It seems to me that the farmers are not getting enough decrease, or difference in price, when you are pushing these tractors at the present time, but you tell us they cannot get it because there is such little difference in the price. Is it enough to be worth while?

Mr. ADAMS: We think it is about \$400 or \$500.

Mr. MANDZIUK: As Mr. Adams said, if they manufacture a light tractor here, it would not be competitive as against what manufacturer—the Canadian manufacturer, the big I.H.C., the Massey company, or competitive against imports?

Mr. ADAMS: As against world-wide competition. Since you mentioned I.H.C. and Massey, let me say that their tractors are imported from the United Kingdom.

Mr. MILLIGAN: Do you not mean that just certain parts are imported?

Mr. ADAMS: Not at all. The complete unit is imported in these cases.

The VICE-CHAIRMAN: It is now about a quarter to five. Is it your wish to try to complete our questioning of these witnesses this afternoon?

Mr. KORCHINSKI: I have all kinds of questions. I was willing to forego my questioning to somebody else, but very obviously you have established a somewhat different rule.

The VICE-CHAIRMAN: There is no different rule at all. Everybody is getting his say.

Mr. KORCHINSKI: Are you allowing us to ask supplementary questions?

The VICE-CHAIRMAN: You have asked some already.

Mr. DANFORTH: My questions are along the same line, but I do not think there is any repetition. It is this information that we are after, and I shall ask my question this way: turning to the financial report, I see there has been a drastic reduction in total sales, even though the prices of farm machinery have increased. Would I be safe in assuming that because of this reduction in total sales your plant today is not operating at capacity?

Mr. ADAMS: That is correct.

Mr. DANFORTH: Would it be a correct generalization?

Mr. BOULANGER: Mr. Chairman, we do not have a quorum.

The VICE-CHAIRMAN: Mr. Boulanger advises me that we do not have a quorum. So let us be at ease for a few minutes.

Gentlemen, we now have a quorum. We have six more members here. Is it the wish of the committee that we continue until 5.30 and complete this matter this afternoon.

Mr. HORNER (*Acadia*): How can you cut it off at 5.30?

The VICE-CHAIRMAN: If we could finish by 6.00 o'clock, then we might continue until then. Is it agreed that we try to finish by 6.00 o'clock?

Mr. KORCHINSKI: Otherwise, would you cut it off at 5.00 o'clock?

The VICE-CHAIRMAN: If we cannot complete this by 6.00 o'clock, then we will cut it off at 5.00 o'clock and come back this evening. Is it agreed that we continue and finish at 6.00 o'clock?

Agreed.

Mr. DANFORTH: I had asked the witness if the factory is operating at capacity. I was assured it is not. My next question is this: could he, by generalizing, give me what he considers the approximate percentage of capacity at which they operate at the present time?

Mr. ADAMS: I would say that we have closed the Smiths Falls plant and are working at about 65 per cent of our present capacity at Brantford.

Mr. DANFORTH: From the statements you have made, am I to understand that the suggested retail price at which you place the implements in the hands of the dealer is 20 per cent over what you charge him; or, in other words, it is a discount of 20 per cent.

Mr. ADAMS: Our dealers receive a discount of 20 per cent from the suggested retail price. Also there are other volume bonus discounts.

Mr. DANFORTH: There are other considerations?

Mr. ADAMS: Yes.

Mr. DANFORTH: That leads me into the next question. There are other arrangements with dealers. Could one of these be incentive purchases on his part in order to reduce inventory of the Cockshutt plant? In other words, would you, or do you, make a habit of giving added bonus incentives, or discount incentives, by reducing the price to him of any implement which might appear to be in an excess production capacity?

Mr. ADAMS: I believe your terminology is, "Do we make a habit of giving added discounts?"

Mr. DANFORTH: Does it happen? Could it conceivably happen that the company would do it in order to reduce inventory? I will put my question in a little different way. At the close, or near the end of a grain harvest season, or during the winter months, would there be an added incentive for a dealer to receive combines from you, or place orders for combines to create work during the winter months?

Mr. ADAMS: From time to time we do encourage our dealers to sell larger volumes by giving allowances or some special incentive. This is a special kind of incentive.

Mr. DANFORTH: I would imagine that would be a common practice among machine companies and not specifically common to Cockshutt alone.

Mr. ADAMS: This may be. I am saying what Cockshutt does. We do this on special occasions.

Mr. HOWE: May I ask a supplementary question? If a dealer sells 100 combines, does he receive a special discount at the end of the year, or is there any figure after which he gets a special incentive?

Mr. ADAMS: All dealers are on volume bonuses.

Mr. DANFORTH: I would like to go a little further into the pricing of machinery. This is what we are interested in. Some of the statements I have heard today have inferred that it is a common practice among machine companies to price their machines at what they feel is the price the traffic will bear. Is that a fair statement?

Mr. ADAMS: No; it is not a fair statement. When you speak about what the traffic will bear, this implies exploitation of the consumer, and that is synonymous with high profits. We do not have high profits, so I could not agree with you that this is a fair statement.

Mr. DANFORTH: I will put my question in another way. I think I can assume from your statements today that the price of a machine which is competitive to one you produce has a definite bearing on your price on the market. I inferred that from your statements today.

Mr. ADAMS: You say the cost has an effect on the price?

Mr. DANFORTH: No, your pricing is based on the price of your competitors on the market.

Mr. ADAMS: The market place is where the final price is set.

Mr. DANFORTH: I agree; but your statements are to the effect that it has a bearing on the price which you put on your machines.

Mr. ADAMS: Competitive pressures, yes.

Mr. DANFORTH: Then that could be your actual cost, plus any reasonable percentage, or it could be an excessive percentage, could it not?

Mr. ADAMS: Yes. It could be a loss.

Mr. DANFORTH: Could it be cost plus 40 per cent? Could it conceivably be your cost plus 40 per cent?

Mr. ADAMS: I would not want to speak to that.

Mr. DANFORTH: It must be a definite figure.

Mr. ADAMS: It could be a possible loss.

Mr. DANFORTH: It could be cost minus ten, or could be cost plus 20 or 30 within the realm of competition.

Mr. ADAMS: Or it could be cost plus 1.8 per cent.

Mr. DANFORTH: When you import a machine you charge a specific markup before you send that machine out to your dealers. I think it was stated by Mr. Horner that this is for the use of the Cockshutt name and your distributing facilities. There is a certain markup over the import price.

Mr. ADAMS: There are costs of distribution, yes.

Mr. DANFORTH: Does it go out to your dealers on the same basis of suggested retail price less 20 per cent?

Mr. ADAMS: We have a suggested retail price. I think Mr. McDonald quoted this to you on the tractor. The normal terms are list less 20 per cent.

Mr. DANFORTH: In other words, the farmer in effect is paying a double mark-up.

Mr. ADAMS: What do you mean by double mark-up?

Mr. DANFORTH: Will the price be the price at which the Cockshutt Company imports the machine laid down in Canada, plus a mark-up for distribution cost, plus a margin for profit and an additional mark-up for the dealer? Am I correct in assuming that?

Mr. ADAMS: I do not believe you are correct in assuming it is built up in the way you state. The price is set by competition; then there is a discount of 20 per cent on which the dealer is to do business.

Mr. DANFORTH: Am I correct in assuming that there is—there must be; you state you are not going to handle the tractor at a loss. You will not import it and handle it at a loss. You put on your distribution cost plus what you consider a reasonable profit, and then the dealer is allowed a discount for expenses plus a reasonable profit. Am I correct in assuming that?

Mr. ADAMS: We would like to make a profit on everything we sell.

Mr. DANFORTH: Then conceivably that could be a double mark-up over the list price, f.o.b.

Mr. ADAMS: I cannot go for your double mark-up terminology.

Mr. DANFORTH: Is it not a mark-up once for the Cockshutt Company and once for the dealer?

Mr. ADAMS: The Cockshutt Company is quite a separate entity from that of the dealer. The dealer is a private businessman who must make out himself just as the company must, which is a separate corporate body.

Mr. DANFORTH: Would you not agree, then, that there is a double mark-up so far as the farmer is concerned?

Mr. ADAMS: Well, you could go back and speak of raw materials and say that we purchase a generator—

Mr. DANFORTH: I fully intend to.

Mr. ADAMS: —and the generator manufacturer also would stay in business by covering his costs and a profit.

Mr. DANFORTH: Would or could an importer of tractors as a distributor operate under the same conditions?

Mr. ADAMS: I believe there are many people who are trying to import.

Mr. DANFORTH: I would still like you to say either yes or no in respect of this double mark-up.

Mr. ADAMS: Everybody along the line has to cover costs and make a profit in order to stay in the business.

Mr. DANFORTH: This is not a trick. I am not trying to get you to make a statement which is out of the way at all. I am just trying to verify this in my own mind and perhaps for the information of the committee. When the Cockshutt Company imports a tractor, before they put it in the hands of their dealer, they take into consideration certain costs together with a marginal profit for the transaction. That is good business; it must be. Would you answer yes or no?

Mr. ADAMS: I concede that there are multiple mark-ups all the way from the raw material to the finished product.

Mr. DANFORTH: I would like to confine it to this one.

Mr. ADAMS: I would think that this thing might be more properly thought of as one mark-up divided amongst these people that produce the product.

Mr. DANFORTH: Well, it goes through two major hands, though, does it not? Once it reaches Canada, it goes through the Cockshutt company, and then the Cockshutt distributor. Is that not true?

Mr. ADAMS: This would apply to all imports, yes.

Mr. DANFORTH: And, in each instance, there is a mark-up?

Mr. ADAMS: In each instance there is a cost and, in each instance, there is a mark-up.

Mr. DANFORTH: Yes, a double mark-up.

Mr. ADAMS: Two mark-ups, not a double.

Mr. DANFORTH: Well, if you wish to call it two mark-ups, I am satisfied with that. Then, as far as the farmer is concerned, there are two mark-ups on a foreign tractor.

Mr. ADAMS: As far as the farmer is concerned, there are multiple mark-ups.

Mr. DANFORTH: To follow that through, I understood you to say this morning—and I may be mistaken—when you conceived of the manufacture of a diesel for Canadian companies it was based on the buying of an engine. Am I correct in saying that?

Mr. ADAMS: That is correct.

Mr. DANFORTH: A diesel engine?

Mr. ADAMS: That is correct.

Mr. DANFORTH: And that would come, conceivably, from the United Kingdom or the United States?

Mr. ADAMS: Yes, the estimate was on a diesel engine from the United Kingdom.

Mr. DANFORTH: Am I correct in saying that the motors used for all Cockshutt tractors are importations? Do you manufacture your own specific motors here for your combines or tractors?

Mr. ADAMS: No, we do not.

Mr. DANFORTH: Does the same thing hold true in connection with the importations of other major units as it does with the importation of tractors?

Mr. ADAMS: We would imagine when we buy an engine from another manufacturer that he covers his costs and makes a profit.

Mr. DANFORTH: And so do you.

Mr. ADAMS: Not on that engine, on the final machine.

Mr. MANDZIUK: You must. You cannot operate without a profit.

Mr. ADAMS: We do, on the final machine.

Mr. DANFORTH: I am speaking of your normal business practices.

Mr. ADAMS: Yes.

Mr. DANFORTH: The engine is a major unit in a tractor.

Mr. ADAMS: Yes, this is a major component.

Mr. DANFORTH: So, in your pricing of that major unit, you are going to take into consideration your cost factors involved in that motor, plus a reasonable profit to Cockshutt?

Mr. ADAMS: On the whole machine, yes.

Mr. DANFORTH: So, in effect, when you put that in the hands of the dealer, we have the same thing there as we have with the importation of a European tractor; we have two mark-ups, as you put it.

Mr. ADAMS: Yes, we have multiple mark-ups, I agree. Even the steel is marked up.

Mr. DANFORTH: I am satisfied with your answers on this.

I have one more question, and this is a general one. A company such as Cockshutt, or any other farm machinery company, operates for the most part on what is going to happen in the future. They must, because of the very nature of their business. Could we have from you, in a general way, what Cockshutt predictions are for the next five years—what the company itself feels, and the period of time that Cockshutt uses for this. Do you see a continual increase in farm machinery? Do you see a levelling off, or do you see Cockshutt having a larger percentage of the farm market? What is Cockshutt's view or projection for the next three or five years? Use your own basis. I know that companies as large as Cockshutt do make these projections.

Mr. ADAMS: Well, we certainly are optimistic, and we aspire to a larger volume.

Mr. DANFORTH: But what is your feeling? I am asking this on behalf of the farmer. What will it be to the farmer? Do you foresee a gradual levelling off of prices or a continued increase in farm implement prices? That is the information I am seeking with this question, and then, Mr. Chairman, I will pass.

Mr. ADAMS: If the inflationary trend continues on all these items about which we have talked, quite conceivably the prices would continue to rise.

Mr. DANFORTH: It will have a definite bearing on these other factors which are pointed out in your graph, No. 6.

Mr. ADAMS: Oh, most decidedly. The only difference between what you see here and the Cockshutt Company are two things: volume and this 1.8 per cent return.

Mr. DANFORTH: The information I am trying to acquire is this: Does the company feel this is a trend, as portrayed in graph 6? Perhaps I have phrased my question wrongly. Do you foresee this trend continuing, on which Cockshutt are basing their future operations, or is there a feeling of optimism that this will level off? What is the thinking of the company?

Mr. ADAMS: We certainly hope that increases will level off, but to say we know the answer would be idle talk.

Mr. DANFORTH: Well, is there any thought that because of the direction labour is taking, that a major company such as yourself, because—and I spoke of the tractor importations—of the fact you are working, then, on a definite mark-up—if labour continues and your material prices increase—will be forced into the import market, rather than the Canadian manufacturing market; in other words, become a major distributor instead of a manufacturer?

Mr. ADAMS: This is too wide a question. We have shown where this happened on one machine. We certainly do not foresee discontinuing manufacture; on the other hand, everything is on an economical basis.

The VICE-CHAIRMAN: Have you a question, Mr. Milligan?

Mr. MILLIGAN: I will pass.

Mr. KORCHINSKI: Earlier, when I asked about your subsidiary operation, you stated that, in fact, it was an arrangement whereby you could perhaps expand—perhaps I should say, continue to operate, and you would not have to go on the money market, which is an expensive market. You felt this was good business, in a sense. However, we have had before this committee a Mr. Coburn. He appeared on May 29th and, in answer to a question about the operation of the industry, he said:

Yes, but if corporations would only satisfy themselves with a rate of profit which would enable them to pay a reasonable dividend, and then go into the money market for the money they need for expansion, in the same way as the farmer has to do, or the man in the city who wants to buy a house, they would be able to reduce prices substantially, and the purchasing power of the people of this country would be considerably greater.

Is it your experience that you have had difficulty getting money on the money market?

Mr. ADAMS: I would say that the first part of your question was: Why do we not pay reasonable dividends, or something of that nature?

Mr. KORCHINSKI: Yes. He has said that if the company would pay reasonable dividends, and then go into the money market for the money they need for expansion, they would be able to reduce prices substantially. I think that will enlighten you somewhat. He did say you were entitled to a fair profit, but he did not think you required that much to carry on your expansion program, from your own financing. My question is not with reference to that, but with reference to this: Do you have a problem in raising funds at any time?

Mr. ADAMS: "No" is the general answer to that question.

Mr. KORCHINSKI: You do not have a problem of raising funds? Did I understand you correctly?

Mr. ADAMS: Mr. Tees will reply.

Mr. TEES: At the moment we have no problem in raising funds for short-term purposes. On the expansion program, like everyone else, we have problems in raising capital, particularly if we do not pay any return to the investors.

Mr. KORCHINSKI: On page 13 of your brief you state you believe the increase in the price of farm machinery is not out of proportion with increased costs, and you go on to say:

What may be out of proportion is the much smaller increase in gross farm income,

—and this was indicated in your graph number VI. You say that if you close out the average hourly earnings, average steel costs and the price of farm machinery, there is somewhat of a relationship, but on the other side of the graph the farm net income and gross farm income is away below in proportion. You also showed a graph to indicate your net operations, and as a matter of fact you stated that in the last six years you did not pay any dividends.

Mr. ADAMS: That is right.

Mr. KORCHINSKI: That would indicate to me you would be interested in showing a greater profit for your company.

Mr. ADAMS: A reasonable return.

Mr. KORCHINSKI: But you would like to pay dividends and so on, which I would accept to be the normal thing. However, when the C.L.C. were here, as reported on page 1024 of the proceedings of evidence Mr. Burt indicated he would like to have the take-home pay increased eventually if the companies were producing more, because of the cost of living. I believe there was also reference in the submission to the fact that when most of the workers retired they did not have very much saved. That was the line he followed and it indicated to me the workers would expect more if productivity went up, and if your profits increased they would also expect more. What I am driving at is how in the world can we increase that other side of the graph, which is the one we need concern ourselves with, if we are to give the worker his increase and you an increase too? When will ever get the curve up on that side of the graph?

Mr. ADAMS: This is called the profits squeeze, the cost price squeeze that we and the farmer are experiencing.

Mr. KORCHINSKI: But you have indicated you are in trouble, and the worker says the cost of living is going up and he would like to have some increase. How shall we ever get this problem solved if we go on those lines?

Mr. BOULANGER: By fair prices for farm products. Increase the gross farm income.

Mr. KORCHINSKI: This is the very point I am trying to make, Mr. Boulanger. If we give better prices and the workers see the machine companies have made more sales and, as a result, have greater profits, the workers will take a slice of those profits and the farmers will still have to pay for the machinery.

Mr. BOULANGER: If the farmers make more money, they will not mind paying more.

Mr. KORCHINSKI: We shall have you as a witness in half an hour, Mr. Boulanger.

Mr. HORNER (*Acadia*): As a supplementary to that, I should like to read a quotation from the dominion bureau of statistics 1960 net farm income report, which has just been published, catalogue number 21-202. It says:

Taking in account changes in farm-held inventories of grains and live-stock, total net farm income for 1960 is estimated at \$1,358.4 million, 12.6 per cent above the revised estimate of \$1,206.3 million for 1959.

You show a deficit there, and are in the red.

Mr. FORBES: Since it has been admitted that farm machine companies have charged all the traffic will bear, if farm income is raised do you propose to increase the price of your machinery in proportion to the increase in farm income?

Mr. ADAMS: To my knowledge farm income is not considered a factor in the pricing of our machinery.

The VICE-CHAIRMAN: You are getting away from Mr. Korchinski's supplementaries.

Mr. KORCHINSKI: My supplementaries? You mean my original question. Now, I just want to read another statement made by Mr. Burt as reported at page 1024 of our proceedings. He said:

Let me tell you that if the technological changes keep the pace at which they have been going in recent years, in another ten years we will probably be demanding less hours of work and more money.

Apparently we are running into that difficulty, and at some place early in your submission you said we were going to have to import more from other countries.

Just before Mr. Burt made that statement, Mr. Bellingham said:

if I produce more and even went along with a wage reduction, that it would do your people on the farms any little good; because I am convinced that if there was any reduction in the cost price of farm implements, even through a reduction in wage costs, it would not be passed to the farmers.

Now we know that demand and dividends may be variable factors, and that is part of our difficulty, but would you be prepared to make a reduction in the price of your machinery if labour took a reduction in wages?

Mr. ADAMS: Remember, when we talk labour we talk farm implement labour and we also talk labour in purchasing parts, raw steel and other materials. If the cost of all these cost components went down, then certainly we would consider analyzing our prices of farm machinery.

Mr. KORCHINSKI: I do not know what percentage you are willing to place on labour in your total operations, but if labour were willing to pull its share of the load would you be prepared to reduce your costs by the same percentage?

Mr. ADAMS: Mr. Korchinski, you must remember what we are up against here. We are talking on a worldwide basis. We have already shown to you that the prices the farmers in Canada pay for a small diesel are essentially come about through a tractor manufactured in the United Kingdom. This means that all the labour in the world has something to say about the final cost, if it is a worldwide market, as we claim it is and as we firmly believe it is.

And I will say to you that the European common market will have a lot to say about this question in the future. This is a question of very grave concern to Cockshutt Farm Equipment. I will suggest this to all the manufacturers in this country.

Mr. KORCHINSKI: Your recommendation (c) on page 15 of your brief suggests that the harvesting machinery imported into western Canada after a certain fixed date, say June 15, be subjected to a dumping duty. Would you then say this would be advantageous to the farmer if competition has brought your prices down; and if these companies can bring it in cheaper after a certain date, why would we want to have this type of recommendation from the committee?

Mr. ADAMS: Is it of interest to the country that they have a farm implement industry?

Mr. KORCHINSKI: Yes, it is of interest to the country, but for what reason was this committee set up? It was set up to consider farm machinery. We were quite concerned with your welfare also. Let no one say differently. But I think we have an equal amount of pressure from farmers who indicated that the price was too high. That is why we want to study the whole problem. We may have to set up another inquiry about your own industry later, but I think this is our immediate problem.

Mr. ADAMS: I agree. All I can say is that the farmer is also interested in the health of the farm implement industry in Canada. This is as much of interest to the farmer as is, as Mr. Tees has said, the buying power of labour.

Mr. KORCHINSKI: That may be so. We can agree on a lot of these things, but would this recommendation not have the direct effect of increasing the price to the farmer? If you give me a simple answer I will quit right there. I am really concerned, because I think that this type of recommendation from this committee would not be to the advantage of the farmer, and I would like your reaction on this.

Mr. ADAMS: In the long run this might be so. By increasing our volume, putting us on a more healthy basis, the farmer might well stand the benefit from a Canadian farm implement industry.

Mr. KORCHINSKI: You are talking in terms of the Canadian industry and yet you also tell us that world wide competition determines the price. If it is world wide competition, and they can produce implements cheaper, I fail to see where you can have enough volume to produce this desired effect.

Mr. ADAMS: This is problematic; it disturbs us as much as you.

Mr. KORCHINSKI: I will pass on.

Mr. McINTOSH: I almost forgot my question. Mr. Adams, I think you said that in determining your suggested retail price to the ultimate purchaser, that volume cannot be underrated to cost. I will ask if your volume was increased, would your profits be higher?

Mr. ADAMS: May I rephrase your question as I understand it? You say that if our volume were increased, our profit would be higher. An increase in volume would generally lead you to believe that there would be an increase in profit. However, it would depend on the reaction in the market place at such time as this took place.

Mr. McINTOSH: If your volume was increased, would the prices to the farmer be reduced?

Mr. ADAMS: I think they might tend to be.

Mr. McINTOSH: In the years when you showed a large profit in your graph, was your volume at that time above average? I will repeat the question. On your graph you showed that you made an 11 per cent profit. Was your volume above average at that time?

Mr. ADAMS: In 1952 and 1953 our volume was higher.

Mr. McINTOSH: Were there any other factors that could contribute to your increase in profit at that time?

Mr. ADAMS: Larger distributors and U.S. sales; perhaps a simpler product, and essentially increased volume.

Mr. McINTOSH: When you analyzed the lowest point where you lost 7.5 per cent, what was your deduction?

Mr. ADAMS: Essentially that the volume, as I quoted earlier, dropped terrifically in that year.

Mr. McINTOSH: Could you tell me to what extent your volume would have to increase to bring your profit to, say, around 8 per cent from what it was last year?

Mr. ADAMS: It depends on the products mix and what was sold at that time. In these years we made essentially one model of tractor—in the earlier years. That was what was demanded by the market. Since that time conditions have changed, the products mix has changed. I am afraid that will have to be your answer.

Mr. McINTOSH: Would you say your products mix extensive means so many different machines that your profit went down, that you are in too extensive a field?

Mr. ADAMS: Not necessarily.

Mr. McINTOSH: It seems to me that when I asked you what contributed to this 5.3 per cent, you were confined to future types of machines which gave you a greater profit.

Mr. ADAMS: I did not say future types of machines.

Mr. McINTOSH: You said a products mix. I do not know what you mean by that.

Mr. ADAMS: I did not say fewer types of machines.

Mr. McINTOSH: You said "products mix". I do not know what you mean.

Mr. ADAMS: I said "simpler machines" and less models of any one type.

Mr. McINTOSH: You have no interest, then, in projecting into the future, in regard to volume that would bring your return to your shareholders up to where you feel it should be?

Mr. ADAMS: The main thing which has happened here, Mr. McIntosh, I should say is that this was the end of the pent-up demand for farm machinery following world war II. This market has been largely satisfied by the end of 1952.

Mr. McINTOSH: But prices did not reduce after that. They increased.

Mr. ADAMS: So did everything else. I would say to you, sir, that since this time the necktie you are wearing has also increased, and the shirt, and the car you drive, and everything else.

Mr. McINTOSH: It is your business to see that your shareholders get a fair return on their money. What is going to be the policy of your company in the future in regard to volume, or your prime cost? Are you going to reduce it, and if so, how can you?

Mr. ADAMS: I would have to say that our policy is to increase our volume, and as to how can we—by hard work.

Mr. McINTOSH: You feel that the volume will bring up the return to your shareholders?

Mr. ADAMS: Yes, we do.

Mr. McINTOSH: My second question is in regard to something I referred to before. This is on page 9, where you say:

While the company supposedly charges a standard rate for farmer credit, competition is so keen that it is necessary to accept many interest free notes.

You said 25 per cent of your sales were time sales. What of interest do you charge on those? Is it 6 per cent?

Mr. ADAMS: We stated it before, that we charge $11\frac{1}{2}$ per cent on other than those that we give on interest free notes. That $11\frac{1}{2}$ per cent is on a declining balance.

Mr. McINTOSH: Then, would it be fair to say that over 50 per cent of the amount of machines that you put out on notes is interest free? Otherwise, where do you get this 3 per cent which has actually decreased your earnings?

Mr. ADAMS: Over 50 per cent is a reasonable figure.

Mr. McINTOSH: One of my colleagues here says that more farmers should know about that interest free clause you have.

Mr. ADAMS: An interest free clause, as you put it, is not a part of a normal agreement. We could never afford to do that. This happens on occasion and as far as we are concerned, it has been happening on too many occasions, but this is a condition of the market brought on by competition.

Mr. McINTOSH: Is your interest free term not applied to wholesalers and distributors rather than to the farmer?

Mr. ADAMS: No, quite decidedly no. It applies to the farmer. That is why the effective rate, the percentage on the money loaned, is around 3 per cent.

Mr. HORNER (*Jasper-Edson*): What criteria do you use to determine which farmers get the interest free notes? Does it depend on the size?

Mr. ADAMS: Competition.

Mr. PASCOE: On page 9 of your brief, in regard to financing the dealers and buyers with F.I.L.A. loans available, what percentage of your sales is financed through the company? Why are not the farmers using F.I.L.A.?

Mr. ADAMS: We do not know how many of our customers use F.I.L.A.

Mr. PASCOE: How many people are using it, as a percentage of your sales?

Mr. ADAMS: 25 per cent.

Mr. PASCOE: On page 11 of your annual report, you say:

There is a contingent liability of \$1,770,000 in respect of customers' notes under discount.

Will that eventually be wiped off or does it go into your operating cost? Do they finally settle up that liability?

Mr. ADAMS: That will be eventually wiped off.

Mr. McINTOSH: Would you say that wages, transportation and material are higher in the United States of America than in Canada?

Mr. ADAMS: I would not be prepared to generalize on that. We know this wage rate we have indicated is higher.

Mr. McINTOSH: Do you know if any of them are lower than they are in Canada—transportation or materials?

Mr. ADAMS: In our experience, material is about the same. I do not believe that would apply, though, to purchased parts containing a great deal of labour. It could not be otherwise—with the labour rates that they have.

Mr. McINTOSH: Would you say that United States firms produce cheaper than Canadian firms?

Mr. ADAMS: I am not aware of their cost figures.

Mr. BOULANGER (*Interpretation*): I would like to put a question to the witness. If I look at the agricultural price index I know that in 1950 the index for agricultural prices was 260.8, in 1951 it was 296.8, whereas in 1959 it had gone down to 242.9. Do you not feel that if there had been an actual increase in the price of agricultural products the farmer would be in a better position to buy farm machinery?

Mr. ADAMS: Yes, certainly.

Mr. BOULANGER (*Interpretation*): Further to that, I note here on page 66 of our proceedings that in 1950 the net income per acre was \$14.94, as against \$23.49 in 1951, whereas in 1959 it had gone down to \$13.97. Again I put the same question—do you not feel this is an explanation why the farmer is not in a position to buy as much farm machinery as before, and therefore your position would improve if the farmers' income improved.

The VICE-CHAIRMAN: Mr. Boulanger, I think the chair has been very lenient with you. You are inclined to go somewhat into the question of farm income. That is a question which can be debated in the house some day.

Mr. MANDZIUK: We are investigating the price of farm machinery. The price of farm machinery has gone up and we are trying to find out the reason.

Mr. HORNER (*Acadia*): You have decided to import this diesel tractor in the 3-2 furrow class. Do you think it is economical for a farmer to buy a diesel tractor in that small ratio size?

Mr. ADAMS: If he uses the tractor for 600 hours or more, it is a more economical proposition.

Mr. HORNER (*Acadia*): You have decided to do this because of cheaper production costs, apparently, in another country besides Canada. Agreed?

Mr. ADAMS: Yes.

Mr. HORNER (*Acadia*): Has Cockshutt ever considered going into farm implement manufacturing in any other country besides Canada?

Mr. ADAMS: We studied it in various countries and we have it under study in several others, but the result has never come about—principally, I suppose, because, of the capital investment and a number of other considerations.

Mr. HORNER (*Acadia*): These are things on which you determine your volume, and to quite an extent, because it determines your price to some extent. Do you not think that if you set up a factory, let us say, in Japan, that you might then export to Canada, because Canada is a country where agricultural implements come in free of any duty, and you could then take full advantage of the Farm Improvement Loans Act and one could perhaps purchase a tractor at one-half the price we are paying now?

Mr. ADAMS: I submit that this is being done with more than one manufacturing firm on this continent.

Mr. HORNER (*Acadia*): But you have never actually done it yourselves, other than in your operation of purchasing a tractor manufactured by another company?

Mr. ADAMS: Not on a large scale, no.

Mr. KORCHINSKI: I have before me your annual report where you say that your 1959 sales were almost equal to your 1960 consolidated sales; and I know that your percentage of profit on Cockshutt sales was 5 per cent in 1959-60. Could you indicate to what this drop could be attributed, when your sales were comparable?

Mr. ADAMS: You are looking at the consolidated statement, are you not?

Mr. KORCHINSKI: Yes.

Mr. ADAMS: We had a substantially lower profit on the Brantford Coach and Body at that time.

Mr. KORCHINSKI: Did you retire any debt in 1959?

Mr. ADAMS: Yes, we did.

Mr. KORCHINSKI: Was it just about comparable to your 1960 debt retirement?

Mr. ADAMS: On page 15, column 6, on the right-hand side, long-term debt in 1959 is shown as \$7,915,061, and approximately \$800,000 of this was retired in 1960.

Mr. KORCHINSKI: I notice that your inventory went down. Does this not necessarily reflect that your percentage of profits could have gone down, again if you had the same kind of year the next year, because your inventories would be lower?

Mr. ADAMS: We hope that we have our inventories in a sounder position.

Mr. KORCHINSKI: You indicated that your wage scale in 1959 was \$2.08, and that in 1960 it was \$2.17.

Mr. ADAMS: I gave that paper away. I think that was it.

Mr. KORCHINSKI: I wonder if you could tell us what this increase has meant to your company?

Mr. ADAMS: Well, it has meant higher costs.

Mr. KORCHINSKI: I mean in dollars and cents. I wondered what the net total of increase would amount to?

Mr. ADAMS: About \$600,000 per year.

Mr. HORNER (*Acadia*): You say \$600,000?

Mr. ADAMS: Yes.

The VICE-CHAIRMAN: Gentlemen, at this time I wish to thank the witnesses for appearing before us today. I believe they have done their best to answer the questions. We were pleased to have you with us. The committee will meet again on Friday morning, in camera.

APPENDIX "A"

STATEMENT OF CONSOLIDATED EARNINGS

COCKSHUTT FARM EQUIPMENT LIMITED

For the Years Ended October 31, 1960 and 1959

	1960	1959
Sales.....	\$ 38,790,452	\$ 38,720,577
Deduct:		
Cost of goods sold including selling, general and administrative costs other than the items set out below.....	\$ 35,298,979	\$ 34,591,093
Executive remuneration.....	91,301	102,000
Directors' fees.....	8,875	7,400
Interest on long term debt.....	366,046	401,991
Interest on bank loans.....	782,379	561,964
Depreciation—buildings and equipment.....	894,920	975,552
Legal fees.....	58,272	23,424
	<u>\$ 37,500,772</u>	<u>\$ 36,663,424</u>
Operating profit.....	\$ 1,289,680	\$ 2,057,153
Add:		
Profit on disposal of property, etc.....	46,262	46,051
Profit for the year before income taxes.....	\$ 1,335,942	\$ 2,103,204
Provision for income taxes.....	36,296	290,040
Net profit for the year.....	<u>\$ 1,299,646</u>	<u>\$ 1,813,164</u>

STATEMENT OF CONSOLIDATED EARNINGS RETAINED FOR USE IN THE BUSINESS

Balance at beginning of year.....	\$ 9,367,315	\$ 7,554,151
Net profit for the year, as above.....	1,299,646	1,813,164
Balance at end of year.....	<u>\$ 10,666,961</u>	<u>\$ 9,367,315</u>

CONSOLIDATED BALANCE SHEET

COCKSHUTT FARM EQUIPMENT LIMITED

As at October 31, 1960 and 1959

LIABILITIES

ASSETS

	October 31 1960	October 31 1959		October 31 1960	October 31 1959
CURRENT ASSETS:			CURRENT LIABILITIES:		
Cash in bank and on hand.....	\$ 1,063,466	\$ 1,651,276	Bank loans—secured.....	\$ 5,018,958	\$ 7,818,714
Accounts and notes receivable less allowance for doubtful accounts.....	12,534,887	12,242,143	Accounts payable and accrued charges.....	3,541,776	4,160,945
Inventories valued at the lower of cost or market.....	17,697,424	20,603,559	Taxes including income taxes.....	88,539	285,526
Investments in other companies—shares and debentures at cost—redeemable at par....	162,000	187,000	Portion of long term debt due within one year (Note 3)	617,500	687,000

STATEMENT SHOWING CHANGES IN WORKING CAPITAL

COCKSHUTT FARM EQUIPMENT LIMITED

For the Year Ended October 31, 1960

INCREASES TO WORKING CAPITAL:

Consolidated profit for the year	\$1,299,646
Portion of cost of buildings and equipment allocated to current operations (depreciation) which did not require an outlay of funds.....	894,920
Book value of fixed assets sold.....	64,977
Proceeds from sale of capital stock.....	131,950
Reduction in investment in subsidiary not consolidated.....	10,768
	<u>\$2,402,261</u>

DECREASES TO WORKING CAPITAL:

Additions to land, buildings and equipment.....	\$1,071,724
Increase in deferred charges.....	63,326
Reduction in long term debt.....	808,000
	<u>\$1,943,050</u>

Resulting in an increase in working capital of:.....	<u>\$ 459,211</u>
--	-------------------

NOTES TO THE FINANCIAL STATEMENTS

October 31, 1960

1. Consolidation:

The assets, liabilities and earnings of Cockshutt Farm Equipment Incorporated and Bellevue Realty Corp., United States Companies have been included in the accompanying consolidated statements on the basis of U.S. \$1.—Canadian \$1. Compared with the Canadian dollar the U.S. dollar was at a discount of 2 $\frac{3}{4}$ % and 5 $\frac{5}{8}$ % at October 31, 1960 and October 31, 1959 respectively. The net current assets of United States Companies included in the consolidated balance sheet amounted to U.S. \$2,771,528 at October 31, 1960 and U.S. \$4,383,682 at October 31, 1959.

2. Land, Buildings and Equipment:

Stated at gross replacement values as appraised by the Canadian Appraisal Company Limited (Smiths Falls plant at August 1, 1912; other parent Company plant at November 30, 1934) with subsequent additions at cost plus unamortized toolage and development costs. There is also included in the gross value an amount of \$62,535 representing securities deposited with the Trustee for the Brantford Coach Realty Limited first mortgage sinking fund bonds Series "A" for the further construction of buildings and the acquisition of additional equipment.

3. Long Term Debt:

	Maturity Date	1960	1959
Cockshutt Farm Equipment Limited			
4 $\frac{1}{2}$ % First mortgage sinking fund bonds Series "A".....	October 1, 1965	\$2,969,000	\$3,243,000
5% Convertible sinking fund debentures.....	February 1, 1968	3,217,500	3,532,000
Cockshutt Farm Equipment Incorporated			
Mortgage payable—due October 31, 1962 in U.S. currency bearing interest at 3% on U.S. \$202,071 and 4% on U.S. \$124,990 principal repayable by instalments....	October 31, 1962	327,061	577,061
Brantford Coach Realty Limited

		<u>\$7,724,561</u>	<u>\$8,602,061</u>

	1960	1959
Less:		
Portion due within one year shown as current liability:		
4½% First mortgage sinking fund bonds Series "A".....	\$ 286,000	\$ 274,000
5% Convertible sinking fund debentures.....	81,500	163,000
Mortgage payable.....	250,000	250,000
	<u>\$ 617,500</u>	<u>\$ 687,000</u>
Total Long Term Debt.....	<u>\$7,107,061</u>	<u>\$7,915,061</u>

4. Capital:

	Shares	Amount
Issued:		
As at October 31, 1959.....	1,086,085	\$10,535,179
During the year—for cash.....	9,350	65,450
—on conversion of debentures.....	2,660	66,500
As at October 31, 1960.....	<u>1,098,095</u>	<u>\$10,667,129</u>

Options expiring on March 26, 1961 are held by employees for the purchase of 1,900 shares of common stock of the Company at \$7 per share.

Mr. B. M. Bechhold, holds an option expiring on February 24, 1962 for the purchase of 100,000 shares of common stock of the Company at \$16 per share.

5. Capital Surplus:

Represents the original excess of net assets book value of investment in a wholly-owned subsidiary company consolidated in these statements and in the assets acquired from a former subsidiary, less certain losses on realization of fixed assets.

6. Income taxes:

The current year's provision for federal income taxes consist of the normal income taxes payable on the profits earned by a subsidiary. No federal income tax is payable on profits of the parent and other subsidiary companies as a result of the carry-forward for tax purposes of prior years' losses and provisions for depreciation charged in the accounts but not previously claimed or allowed. Apart from such losses and provisions consolidated net profit for the year ended October 31, 1960 would have been reduced by additional income taxes of approximately \$742,000.

7. Employees' Pension Fund:

In accordance with the pension agreements with the employees of the consolidated companies there was an unfunded actuarial liability for past service as at October 31, 1960 of \$3,588,105. The relative provision for the instalments applicable to the year ended October 31, 1960 has been included in the operating accounts.

8. Contingent Liability:

There is a contingent liability of \$1,770,000 in respect of customers' notes under discount.

9. Acquisition of N. K. Winston-Sanson Florida Corp.:

On December 13, 1960 the Company acquired all the issued and outstanding shares of the N. K. Winston-Sanson Florida Corp. (Florida Corporation), in exchange for 380,000 shares of the unissued common stock of the Company.

Of the 380,000 shares issued to the Florida Corporation stockholders, 330,000 shares were immediately transferred to the Bank of Montreal Trust Company, New York, as escrow agent under an escrow agreement providing for release of the escrow shares under certain terms and conditions as contained in the agreement dated July 13, 1960 between the stockholders of the Florida Corporation and the Company, a summary of which is attached. The business of the Florida Corporation is that of investing in, acquiring, developing and selling real estate properties and interests therein.

SUMMARY OF AGREEMENT DATED JULY 13, 1960
BETWEEN STOCKHOLDERS OF N. K. WINSTON-SANSON
FLORIDA CORP. AND COCKSHUTT FARM EQUIPMENT LIMITED

*The following summary is not complete and reference should be made
to the agreement for the full terms and provisions*

All the issued and outstanding shares of N. K. Winston-Sanson Florida Corp. (Florida Corporation) are to be delivered to Cockshutt Farm Equipment Limited (Cockshutt) on a closing date (not later than December 15, 1960) to be determined. An aggregate of 380,000 shares of Cockshutt will be issued to the Florida Corporation stockholders on the closing date, but 330,000 of such shares will be immediately transferred by them to Bank of Montreal Trust Company, New York, as escrow agent under an escrow agreement providing for release of the escrowed shares under certain terms and conditions:

- (1) At any time after six months from the closing date, 30,000 shares will be released upon the request of one of the Principal Stockholders of the Florida Corporation (Messrs. N. K. Winston, Stanton D. Sanson and J. E. Davis);
- (2) the remaining 300,000 shares of Cockshutt may be released to the Florida Corporation stockholders upon the basis of release requests filed with the escrow agent by the Principal Stockholders of the Florida Corporation and stating the facts by which the release is permissible.

Such release requests may be filed from time to time for a period of five years from the closing date except that the Florida Corporation stockholders will have a period of six additional months, if needed to complete the final release request. Any shares remaining in escrow at the end of such period will be returned to Cockshutt for cancellation.

The Florida Corporation stockholders will be entitled to obtain the release from escrow of 15,000 shares of Cockshutt for each \$550,000 of Unused Realized Value developed by the Florida Corporation. Unused Realized Value means the aggregate of Realized Values up to the date of a release request less the amount of such Realized Values on the basis of which shares of Cockshutt have been previously released from escrow.

Realized Value means the sum of the following:

- (a) The amount actually received (including the principal amount of any mortgage assumed by the purchaser or to which it takes subject) on the sale of any undeveloped property owned by the Florida Corporation on March 31, 1960 less cash expenses of such sales, including a provision for federal income taxes, plus an amount equal to ten times the interest (after provision for federal income taxes on such interest) on the unpaid balance of the sales price for the first twelve months after the sale; provided, however, that with respect to any sale when 43% of the sales price is received in cash, the Realized

Value shall equal the sales price, including any interest actually received, less expenses of the sale and provision for federal income taxes.

- (b) With respect to sales of undeveloped property acquired by the Florida Corporation after March 31, 1960, the sales price thereof (including the principal amount of any mortgage assumed by the purchaser or to which it takes subject) less expenses of sale, provision for federal income taxes and cost of acquisition; provided, however, that no such sale shall be taken into account until at least 43% of the sales price actually has been received.
- (c) With respect to sales of developed or improved land, the sales price thereof (including the principal amount of any mortgage assumed by the purchaser or to which it takes subject) less cash expenses of sale, provision for federal income taxes, the Florida Corporation's costs of development and/or improvement since March 31, 1960 (net of applicable depreciation) and, if the property was acquired after March 31, 1960, the cost of acquisition; provided, however, that no such sale shall be taken into account until at least 43% of the sales price actually has been received.
- (d) Subject to certain limitations, an amount computed on the basis of the rental, interest, royalties and other items of recurring income received during the preceding twelve months.
- (e) Non-recurring and other income items not covered by the preceding sub-paragraphs.

The agreement also contains provisions for the release of additional Cockshutt shares to the Florida Corporation stockholders from the escrow at the termination thereof, (assuming that all of the escrowed shares have not been previously released pursuant to the terms of the agreement) on the basis of treating as Realized Values amounts not taken into account because of the 43% provision. Also the agreement, provides for the release at that time of one Cockshutt share for each \$56.67 of net appraised value of unsold properties then owned by the Florida Corporation.

In addition, the Florida Corporation stockholders will be entitled to the release of all Cockshutt shares then held in escrow upon the happening of any of the following:

- (a) Whenever the total Realized Values covered by release requests exceed \$5,500,000, if at such time the net appraised value of the Florida Corporation's properties is at least \$8,500,000.
- (b) Whenever the total Realized Values, even though not covered by release requests because of the 43% rule, equal at least \$11,000,000.

Voting of the shares of Cockshutt while such shares remain in escrow will be carried out by the escrow agent generally in conformity with the joint instructions of Norman K. Winston and the Chairman of the Board of Cockshutt. Any dividends payable in respect of shares of Cockshutt in escrow will be paid to the persons who may be entitled to the release of such shares.

The agreement contains provisions whereby, during the period that shares of Cockshutt remain in escrow, the Principal Stockholders may not be deprived of the executive management of the Florida Corporation through the removal of, or failure to elect the Principal Stockholders or their designated representatives as a majority of the Board of Directors of the Florida Corporation under penalty of release of shares remaining in escrow; provided, however, any such persons may be removed as officers and directors of the Florida Corporation for a failure to conduct the business of the Florida Corporation consistently with good business practice for a corporation of its type.

The Principal Stockholders of the Florida Corporation have agreed that, for at least the period of escrow plus one year, they will not engage in similar or related activities, in the State of Florida, to those carried on by the Florida Corporation.

It is expected that after closing Messrs. Winston and Sanson will be proposed for election to the board of directors of Cockshutt.

The contract provides that Cockshutt will continue the arrangements for the Florida Corporation's existing lines of credit up to \$2,000,000, if existing banking institutions extending such existing lines of credit are agreeable thereto; provided, however, that such continuation be made without the requirement of personal guarantees of the Principal Stockholders. The contract also provides that Cockshutt will use its best efforts in co-operation with the management of the Florida Corporation to secure for the Florida Corporation on desirable terms, any additional capital necessary or desirable in order to enable the Florida Corporation to carry out its development programme. There is a further provision in the contract that, during the period that any shares of Cockshutt remain in escrow, Cockshutt will not, unless the Principal Stockholders or their successors shall have consented in writing thereto, (a) merge or consolidate the Florida Corporation into or with another corporation or corporations, (b) pay dividends or effect other distributions on the stock of the Florida Corporations, (c) issue additional shares of Florida Corporation or dispose of shares acquired by it at the closing, (d) liquidate the Florida Corporation or dispose of all or substantially all its assets or, with certain exceptions, pledge or hypothecate any shares of the Florida Corporation.

ORDER OF REFERENCE

WEDNESDAY, June 21, 1961.

Ordered,—That the Annual Report of the Canadian Wheat Board for the Crop Year ended July 31, 1960, which was tabled on March 3, 1961, and the Report of the Board of Grain Commissioners for 1960, which was tabled on April 12, 1961, and the Supplementary Report of the Canadian Wheat Board on the 1959-60 Pool Account for Wheat, Oats and Barley, tabled today, be referred to the Standing Committee on Agriculture and Colonization.

Attest

LÉON-J. RAYMOND,
Clerk of the House.

MINUTES OF PROCEEDINGS

FRIDAY, June 23, 1961.
(33)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Campbell (*Lambton-Kent*), Clancy, Clermont, Danforth, Doucett, Fane, Forbes, Gundlock, Henderson, Horner (*Acadia*), McBain, Mandziuk, Milligan, Montgomery, Muir (*Lisgar*), Nasserden, Pascoe, Peters, Rapp, Stefanson, Thomas, Tucker, Villeneuve, Webb.—(25).

In attendance: From the Board of Grain Commissioners for Canada: Messrs. G. N. McConnell, Chief Commissioner; A. V. Svoboda, Commissioner; W. J. MacLeod, Secretary; E. E. Baxter, Chief Statistician; P. Fraser, Assistant Chief Grain Inspector; Dr. I. Hlynka, Assistant Chief Chemist.

The Chairman introduced Mr. McConnell, who in turn, introduced the officials of the Board.

Mr. MacLeod presented the Report of the Board of Grain Commissioners for Canada for the year 1960.

The Committee questioned the officials on and agreed to the following sections of the Report:

- Grain Supplies and Disposition—Crop Year 1959-60
- Marketings
- Country Shipments
- Terminal Handlings
- Eastern Elevator Handlings
- Exports
- Domestic Usage
- Carryover
- Licensing and Bonding.

At 10.55 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING (34)

The Committee reconvened at 2.55 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Clermont, Danforth, Doucett, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), McBain, Mandziuk, Milligan, Muir (*Lisgar*), Nasserden, Pascoe, Rapp, Rogers, Southam, Stefanson, Thomas, Tucker, Villeneuve.—(22).

In attendance: From the Board of Grain Commissioners for Canada: Messrs. G. N. McConnell, Chief Commissioner; A. V. Svoboda, Commissioner; W. J. MacLeod, Secretary; E. E. Baxter, Chief Statistician, and P. Fraser, Assistant Chief Grain Inspector; Drs. I. Hlynka, Assistant Chief Chemist and H. E. Gray, entomologist.

The questioning of the officials was resumed and the Committee agreed to the following sections of the Report:

- Assistant Commissioners
- Prosecutions
- Shortage and Overages, Country Elevators
- Regulations
- Committees on Grain Standards
- Inspection of Grain
- Research Laboratory
- Weighing of Grain
- Weighover of Stocks, Terminals and Eastern Elevators
- Entomological Investigations
- Terminal and Eastern Complaints
- Complaints on Export Shipments
- Statistics
- Information Program
- Canadian Government Elevators
- Lake Freight Rates
- Prairie Farm Assistance Act
- Organization and Personnel
- Expenditure and Revenue

The Committee concluded the consideration of the said report and approved the following Appendices:

- A. Committee on Western Grain Standards as at December 31, 1960
- B. Grain Appeal Tribunals
- C. Statistics Branch
- D. Inspection Branch
- E. Grain Weighing Branch
- F. The Grain Research Laboratory
- G. Canadian Government Elevators
- H. Expenditure and Revenue
- I. Regulations.

Moved by Mr. Thomas, Seconded by Mr. Henderson,

Agreed,—That the Committee express its appreciation for the appearance of the Board of Grain Commissioners for Canada.

At 4.45 p.m. the Committee adjourned until Monday, June 26 at 9.30 a.m. to consider the Annual Report (1960) and Supplementary Report (1959-60) of the Canadian Wheat Board.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

FRIDAY, June 23, 1961.

The CHAIRMAN: We have a quorum, gentlemen. Will you come to order, please.

I am very pleased, this morning, to welcome the board of grain commissioners for Canada. On my immediate right is Mr. G. N. McConnell, chief commissioner. At this time I am very pleased to call on Mr. McConnell to introduce the other members of his board.

Mr. G. N. McCONNELL (*Chief Commissioner, Board of Grain Commissioners*): Mr. Chairman and gentlemen, before I introduce my colleagues today, I would like to say a brief word. You all know Mr. R. W. Milner and I am sure he is highly respected. On Monday when I was speaking to him he said that he would like to be remembered to all of you.

I would like to introduce Commissioner A. V. Svoboda, Mr. W. J. MacLeod, the secretary of the board; Mr. E. E. Baxter, chief statistician; Mr. P. Fraser, assistant chief grain inspector; and Dr. I. Hlynka, assistant chief chemist for the laboratory.

The CHAIRMAN: Thank you very much, Mr. McConnell.

I might say, gentlemen, that all the wheat pools have been advised that the board of grain commissioners would be with us this morning and the Canadian wheat board next Monday and Tuesday, along with the federation of agriculture and the farmers union. I believe one of the pools is represented this morning at the back of the hall—the northwest line elevators. We are very pleased to have them with us at our meeting.

Mr. McConnell, we will now ask you or your secretary to present your report. After that we will go back and deal with it paragraph by paragraph.

Mr. W. J. MacLEOD (*Secretary, Board of Grain Commissioners*):

Winnipeg, Manitoba,
January 13, 1961.

The Honourable Alvin Hamilton, M.P.,
Minister of Agriculture,
Ottawa, Canada.

Sir:

We beg to submit herewith report of the board of grain commissioners for Canada for the year 1960 in compliance with section 23 of the Canada Grain Act.

This report records information and statistics relating to grain handlings for the crop year August 1, 1959 to July 31, 1960, expenditures and revenue for the fiscal year April 1, 1959 to March 31, 1960, and summarizes the major activities of the board for the 1960 calendar year.

Grain Supplies and Disposition—Crop Year 1959-60

Canada's grain carryover was further reduced during the 1959-60 crop year despite declines in the disappearance through both domestic and export outlets. By July 31, 1960, combined stocks of wheat, oats, barley, rye and flaxseed in all positions totalled 763.5 million bushels, some 47.1 millions or 6 per cent below the storage volume at the preceding year ending and 356.8 millions lighter than the record carryover of 1,120.3 millions on July 31, 1957.

The inward carryover at August 1, 1959, was estimated at 810.6 million bushels held either in licensed storage, or in farmers' bins, or in transit between positions. The 1959 crops of wheat, 413.5 millions, and oats 417.9 millions, were above 1958 production, that of rye steady at 8.1 millions and those of barley 225.6 and flaxseed 17.7 millions, were below the previous year's output. The combined production of 1,082.8 million bushels, added to the inward carryover, established the available supplies at 1,893.4 million bushels for 1959-60 domestic needs and exports.

The 1959-60 commercial disappearance of 1,129.9 millions was made up of 352.4 millions exported in the form of grain or wheat flour and 777.5 millions utilized within Canada for feed, seed, human food and industrial use. Both exports and domestic usage were down from the corresponding volumes for the 1958-59 season although still well above the long-term 30-year averages for these movements.

Within the licensed elevator system the individual sector operations reflected a varied pattern. Country marketings were down in total, although wheat deliveries were heavier than in the previous season. Country elevator shipments held relatively steady but a shift in the distribution pattern was indicated by an increased movement to lakehead terminals and to mills. Carlots to the Pacific Coast fell off as ocean shipping at that sector was cut back; this resulted in lighter shipments from Alberta elevators and a heavier movement from Saskatchewan points. At Fort William-Port Arthur terminals the vessel movement showed a slight increase. The period August 1, 1959 to July 31, 1960 represented the first complete crop year of operations subsequent to the opening of the St. Lawrence Seaway. The development of a direct overseas cargo movement in volume from the Canadian lakehead, the elimination of a substantial portion of the transfer vessel movement at lower lake ports and the impact of these developments on operations at the St. Lawrence river elevators, are immediate results reflected in the handling statistics.

Mr. HORNER (*Acadia*): Mr. Chairman, are we going to ask questions on each paragraph? That is the way it has been done the last couple of years.

The CHAIRMAN: It is up to the committee, whichever way the members wish to handle this. Do you prefer to have it read one paragraph at a time and then ask questions before going on to the next paragraph.

An hon. MEMBER: I think that is a good idea.

Mr. HORNER (*Acadia*): This is the way it has been done in the last few years.

Mr. PASCOE: I think it is a good idea, but I hope we will be at liberty to go back to any question, after we have gone through the whole report in this manner.

The CHAIRMAN: Yes. This way will keep us a little in touch with each paragraph. We will ask questions after each paragraph has been read, and then we will come back and review the whole situation later on.

Mr. HORNER (*Acadia*): My first question on this paragraph is in respect of the St. Lawrence seaway. What percentage of grain now moves by the St. Lawrence seaway from Fort William right out to the ocean, rather than coming up to the Georgian bay ports and then going by rail?

Mr. McCONNELL: You mean directly overseas?

Mr. HORNER (*Acadia*): Yes.

Mr. McCONNELL: Two years ago I think there were fifty-eight boats moving out of the lakehead direct, and last year eighty-nine. This would involve about twenty million bushels being moved direct.

Mr. HORNER (*Acadia*): This is not exactly what I meant. Previous to the seaway a lot of grain moved by rail from the Georgian bay ports up to Montreal and to other ports along the St. Lawrence river. Has this amount diminished? It used to be that pretty nearly one-half the grain moved by rail from the Georgian bay ports.

Mr. McCONNELL: I would say it is much less.

Mr. E. E. BAXTER (*Chief Statistician, Board of Grain Commissioners*): Could we defer that question until we come to page 8 under the heading of Eastern elevator handlings. This matter is covered there. At the moment the pattern seems to be reasonably steady. There seems to be about the same rail movement from the bay ports down to the St. Lawrence and the maritimes over the past two years. This last year it did not continue to decline.

Mr. PASCOE: On page 6 it says:

Carlots to the Pacific coast fell off as ocean shipping at that sector was cut back.

Was that cut back because of lack of markets?

Mr. McCONNELL: The main reason was that the 1957-58 year was the peak year at the coast and there just was not as much grain moved out to the west coast.

Mr. HORNER (*Acadia*): Were there not some steps taken on the part of the railroads because they were afraid they were going to have a lot of box-cars tied up and no loading facilities to unload, because of the threatened strike, and that this stopped shipments to the west coast. We heard complaints about this.

Mr. P. FRASER (*Assistant Chief Grain Inspector, Board of Grain Commissioners*): Mr. Chairman, there was a hold-up in the shipments to the west coast due to the threat of strike action.

Mr. McCONNELL: You think it did affect the overall movement?

Mr. FRASER: Yes.

The CHAIRMAN: Are there any further questions in respect of this paragraph?

Mr. HORNER (*Acadia*): I wonder if you might give us some idea of the estimated amount of grain used on the farms. I am thinking of that used for feeding livestock. You talk about the stocks on hand. How do you arrive at the amount of grain used domestically for livestock feeding and so on? Is this an accurate figure or is it just an educated guess?

Mr. BAXTER: I stand on a certain amount of dignity and professional pride with regard to an educated guess. Mr. Horner's suggestion is quite correct. It is a residual figure. In other words, we have the estimated figures for the total production. We have the estimated figure for the carry-over on the farms at the beginning of the crop year; then we know what has moved through the line elevator system, through the commercial channels and overseas; we know what has remained at the end of the crop year. We have an estimate again of what is on the farms, and the balance which has apparently disappeared is taken as the amount used on the farms without coming into our channels.

Mr. HORNER (*Acadia*): You have no idea, actually, as to how this is used? You have no figures with regard to the amount that is transferred through the feed mill arrangement, or the amount which is fed locally by the farmer himself?

Mr. BAXTER: There are certain checks which are used as statistical checks on this. We compare our figures with the dominion bureau of statistics which is responsible for these figures. Their figures have regard to the livestock and poultry population; in other words, the main feed usage outlets; and if the live-

stock population had decreased and the amount of grain fed on the farm had increased, we would automatically question that figure. As to the second question dealing with the amount of grain going through unlicensed mills, the feed mills, I believe the Canadian wheat board—in fact I know—are required to report on it, at the close of the crop year, when they will have the figures on the quantity so used.

Mr. MUIR (*Lisgar*): I think you will find your question is answered on page nine.

Mr. BAXTER: Yes.

Mr. MACLEOD:

Marketings

The restricting influence of the continued congested storage situation on the primary movement into the licensed system was again indicated in 1959-60 by a further decline in country marketings at western points. Total deliveries during the crop year to all licensed elevators, east and west, amounted to 518.8 million bushels of wheat, oats, barley, rye, and flaxseed combined,—38.0 millions below the previous season's intake. Deliveries to western country elevators totalled 512.0 millions, with primary marketings at interior terminals and mills accounting for 4.6 millions, and loadings over platforms a further .2 millions. Primary deliveries of eastern grown grain direct to licensed eastern elevators at 2.0 millions were the lightest in recent years. Wheat marketings did not reflect the downward trend of the total and at 379.9 millions were slightly above the 1958-59 inward volume. The principal decline in marketings occurred in barley (95.6 millions compared with 121.3 millions the year previous) and in oats for which the 24.6 millions delivered represented the lightest marketings of this grain in over 30 years.

The CHAIRMAN: Are there any questions on marketings?

Mr. BOULANGER: What is the reason for the lower marketing of oats and barley?

Mr. MCCONNELL: I would say the main reason for that particular year was the bad harvest in that year. About half the crop was out under the snow; and I think also with the maximum livestock population there was not as much being moved; and in the matter of the marketing of oats, the quotas did play a part. After all, dollar for dollar, you get more money for delivering wheat than you do for delivering oats.

Mr. BOULANGER: Do you not think that because of the lack of feed grain in the east last fall, that was the reason why the market for feed oats and barley was lower, because in the east last winter they were short of feed grain?

Mr. MCCONNELL: I think that is a question much more properly to be addressed to the wheat board, as to the marketings of oats and barley.

Mr. MILLIGAN: What do you mean by "primary deliveries of eastern grown grain direct to licensed eastern elevators"?

Mr. MCCONNELL: We provide space in the eastern elevators so that you can market your wheat; it comes in earlier from the east than it does from the west.

Mr. MILLIGAN: That is for eastern grown grain?

Mr. MCCONNELL: Yes.

Mr. PASCOE: What do you mean by primary marketings at interior terminals?

Mr. McCONNELL: That is the original movement of the grain to the primary point. The primary means the first inspection, the primary part of it.

Mr. PASCOE: Thank you.

Mr. McCONNELL: We operate six government elevators at the following points, Prince Rupert, Lethbridge, Edmonton, Calgary, Saskatoon, and Moose Jaw.

The CHAIRMAN: Are there any further questions? If not, let us proceed to "country shipments".

Mr. MACLEOD:

Country Shipments

The volume of grain moving forward from country elevators was relatively steady during 1959-60, at 525.2 millions in total. The carlot movement had registered a sharp decline in 1958-59 but this was not repeated and wheat shipments were 17.0 millions heavier at 367.0 millions and close to the 1957-58 level. The distribution pattern of this rail movement showed a reduced percentage (25.2%) billed for west coast destinations, reflecting a reversal of the trend of recent years during which the carlot movement to Pacific Coast terminals had risen progressively from 21.0% of total country shipments in 1955-56 to 28.1% in 1958-59.

Mr. MUIR (*Lisgar*): What is the total shipment out of your Pacific terminals for that year?

Mr. BAXTER: I can get the figure for you, sir.

Mr. HORNER (*Acadia*): I think you will find that it is in the next paragraph at 95.1 million.

The CHAIRMAN: Are there any further questions on "country shipments"? If not, let us pass on to "terminal handlings".

Mr. MACLEOD:

Terminal Handlings

Receipts and shipments at the Fort William-Port Arthur terminal group were slightly heavier during 1959-60 at 299.7 millions unloaded and 295.4 millions shipped. The lake portion (286.7 millions) of the latter figure was 8.5 millions higher than the previous year's vessel movement as a result of increases in both direct overseas shipping (16.8 millions compared with 11.9 millions) and cargoes billed to United States lake ports (19.4 millions against 15.9 millions in 1958-59).

Pacific coast terminals reported a reduced handling volume for the second consecutive year. Wheat shipments were down 11.4 millions at 95.1 millions, and barley loadings dropped 5.0 millions to 31.9 millions. Clearances of oats at 2.7 millions, rye at .3 millions and flaxseed at 6.8 millions, completed the 136.8 millions of ocean shipping through this sector—17.3 millions less than the 1958-59 outbound traffic and 32.8 millions below the peak movement recorded in 1957-58.

The Port of Churchill handled 21.7 million bushels of wheat and .1 millions of oats during the 1959-60 crop season to establish a new record for shipping through the North-east passage. The 1960 season of navigation, the initial portion of which is included in the above crop year figures, saw a slight falling off in Churchill loadings. Forty-eight vessels carried a total wheat cargo of 19.6 millions, compared with the 58 vessels and 21.8 millions in 1959.

The damp harvest of 1959 resulted in substantial grain-drying operations at all terminal positions. A total of 76.6 million bushels of wheat, oats, barley, rye and flaxseed combined were dried during the crop year—53.3 millions by artificial and 23.3 millions by natural means. The largest portion of this operation, 45.7 millions, was accomplished at the Fort William-Port Arthur terminals; Pacific Coast terminals dried 27.9 millions; interior terminals dried 2.7 millions, and a further .2 millions were dried at Churchill. This volume is, of course, short of the 168.8 millions dried in 1951-52 following the very difficult harvest of the 1951 crop, when Canadian facilities were supplemented by driers at Duluth, Buffalo and certain Eastern Canadian points.

Mr. HORNER (*Acadia*): Would it be fair to say since you suggested that the railways feared a tie-up on the west coast that this possibly had some effect on the shipments to the west coast? Would you agree that this probably was the reason why Alberta deliveries fell off last year to some extent?

Mr. McCONNELL: Were the quotas lower for Alberta last year?

Mr. HORNER (*Acadia*): They were, from the previous year, yes. But you mentioned earlier that Alberta deliveries were down.

Mr. McCONNELL: Again I think that the wheat board comes into the picture, because the pricing varies whether it is east coast or west coast; that certainly has a bearing on where the grain is going to move. I would not like to go out on a limb for that. I think again I would ask the wheat board, because they have more to do with the direction of grain than we have.

Mr. HORNER (*Acadia*): I have another question on a slightly different point. Am I right in saying that it is against the rules or the laws for there to be terminal mixing?

Mr. McCONNELL: In the statutory grades, yes, the top four grades of wheat.

Mr. HORNER (*Acadia*): In other words, they can be mixed at either the lakehead or the elevator points?

Mr. McCONNELL: We have no control over the country elevator points.

Mr. HORNER (*Acadia*): But they cannot be mixed. This concerned me, because sometimes Canada finds itself in a position where it does not have the required grades to meet the market. Do you think that if the companies were allowed to mix them at the terminals, that this would facilitate marketing more easily?

Mr. McCONNELL: There was a hearing some years back, Mr. Horner, and a decision was made at that time that mixing at the terminal level was not good for the farmer.

Mr. HORNER (*Acadia*): How many years back was this?

Mr. McCONNELL: That is about 29 or 30 years ago, I would say.

Mr. HORNER (*Acadia*): But the point is that marketing conditions have changed drastically since that time, and countries all over the world are soliciting particular grades of wheat. I remember a few years ago the wheat board informed this committee that they had lost sales because they did not have the grades of wheat that were requested. This is a point I am bringing up. If they were allowed to mix at terminals, and this grain was inspected by the board of grain commissioners to make sure that the standards were maintained, I think this would be beneficial. I would not want to see the standards lowered, but surely the board of grain commissioners would govern mixing at the terminals in the same way as a country elevator man governs it at his own elevator. Would this not facilitate marketing to some extent?

Mr. McCONNELL: My opinion would be that the demand for the lower grades during the last few years was a matter of price as much as of quality.

Mr. HORNER (*Acadia*): In that same regard, the price has been very narrow.

Mr. McCONNELL: Another thing is that during the last four years we have had four very high quality crops. I think the four of them tested around 14 per cent protein and, as a matter of fact, the lower grades were equal, or almost equal to the top grades and, for a lower price, they were getting almost the same quality. I think it would be a retrograde step for the farmer to start mixing again.

Mr. HORNER (*Acadia*): Do you not feel the board could control it?

Mr. McCONNELL: Well, I have a better man to speak in this connection than myself. Would you speak to that, Mr. Fraser?

Mr. FRASER: The prohibition of mixing in the top milling grades, including garnets in the first two grades, is the best control we have to assure that export standard will be observed in the movement of grain. We have, at the level of No. 3 Northern, the introduction of varieties that are not equal to Marquis, and while a 10 per cent tolerance is allowed in No. 3 Northern at the domestic level, we do not export, by any means, to this level.

Over the years we have maintained a constant level of about 4 per cent in our export movements. I am quite sure if we did this that we did this that we would hear very quickly from our customers overseas.

Mr. HORNER (*Acadia*): You do not feel the quality and standard could be maintained if they were allowed to mix?

Mr. FRASER: It would depend on an increase in varieties that are not equal to Marquis.

Mr. MANDZIUK: Mr. Chairman, I would like to know what governs loadings at Churchill. I notice in paragraph 3 that handlings were decreased from 1959 from 21 millions to 19 millions.

Mr. McCONNELL: Again, this is a matter for the wheat board. They sell that grain from the 25th of July to about the 10th of October. It all has to move through that period of time, which is about 70 to 75 days. It practically all goes to the British market, and that is about all the wheat they can sell in that particular time. However, you can bring it to the attention of the wheat board later.

Mr. HORNER (*Acadia*): They are enlarging facilities at Churchill, are they not?

Mr. McCONNELL: No, just the dock.

Mr. MANDZIUK: What is the capacity of that terminal at Churchill?

Mr. McCONNELL: 5½ million.

Mr. RAPP: Mr. Chairman, I would like to know whether any additional grain-drying equipment is being installed now. I can recall during the 1959-60 crop year, the northern sections of the three prairie provinces were actually handicapped because we had tough and damp grain and we were given to understand the elevators could not take it in because there was not enough grain-drying equipment at the terminals. I do not think there will be any damage this year. However, it could happen again, and I would like to see more grain-drying equipment installed at the terminals.

Mr. McCONNELL: I think practically all the terminals have either one dryer or more. You must realize that these dryers cost anywhere from \$125,000 to \$150,000. There is only one year in approximately four or five, and sometimes seven, eight or ten, that they are used. As I say, it is an expensive piece of equipment.

Mr. RAPP: But the farmers have lost much more than \$125,000. There was so much tough and damp grain that no elevator space was available at the

delivery point, and the farmer definitely was not able to store that damp grain. I would like to see that, although it costs money. However, nevertheless there should be grain-drying equipment installed there in order to handle this grain in times of emergency.

Mr. McCONNELL: I think that we were able to handle and dry all the tough and damp grain that was delivered under the quota. Anyway, how would you deliver it within the quota?

Mr. RAPP: I think there were special quotas allowed in respect to the tough and damp grain. However, it was difficult to obtain cars to deliver it to the terminals because there was not enough room to store that grain there, and the drying equipment could not keep up with all the grain that was being shipped into these terminals.

Mr. McCONNELL: As I recall it, I think the drying capacity and the space in the elevator was always pretty well taken up. In other words, they could only dry so much grain because they could only store so much dry grain.

Mr. RAPP: I know that the equipment is expensive, but I think consideration should be given and, if there is a possibility to have this grain-drying equipment installed, in case of an emergency, the farmers would not be put in the position which they were in 1959-60. I know, from experience, because in the northern parts of Saskatchewan, particularly, there were many, many places where the elevators could not take their grain in because there was not enough room, and the drying equipment in the terminals could not handle the grain.

Mr. McCONNELL: It would be the opinion of our board, sir, that we encourage the terminals to put in the drying equipment, rather than the farmers.

It was a very bad harvest and fall in 1959, and I think we were supervising, were we not, Mr. Hlynka, between 200 and 300 equipment dryers, and we received wonderful co-operation from the farmers. Of all that grain dried—53 million dried by equipment and 56 million naturally dried; I think those are the figures—there was only one cargo got away from us, and it was a small parcel of 36,000 bushels—and we had to reduce the grade from three to four. I think that speaks very well for the terminals in handling the over-all situation and taking into consideration the difficult crop of that year.

The CHAIRMAN: Have you a question, Mr. Muir?

Mr. MUIR (*Lisgar*): I had a question on the capacity at Churchill, but it has been answered.

I would like to make one observation on this section. I hope there will be no change in the law regarding terminal mixing, because that was put in for the farmers. I hope it stays there.

Mr. PASCOE: I have a supplementary to Mr. Rapp's question. It said 2.7 million. Is that the capacity?

Mr. McCONNELL: You are speaking of the government elevators?

Mr. PASCOE: Yes; in the interior. Is it the capacity?

Mr. McCONNELL: Well, we handle quite a bit of rapeseed. We certainly never turned any away. I am not sure if it is the capacity. I remember Mr. Jacobson speaking to Mr. Milner about the fact that the farmers wanted to bring in damp grain by truckload. That is a slow operation, because you need a batch of one thousand bushels to dry; but we agreed in the interior we would take it and dry it for the farmers, and let them take it back.

Mr. HORNER (*Acadia*): What do you mean by drying by natural means?

Mr. McCONNELL: Promotions of toughs. The toughs can be promoted to the proper grade.

Mr. HORNER (*Acadia*): But you say here 53.3 millions by artificial and 23.3 millions by natural means. What constitutes natural means?

Mr. FRASER: 53.3 millions artificially dried means that drying machines were used and the 23.3 millions dried by natural means is the blending of tough grain with straight grain. Speaking of wheat, 14.5 per cent is the limit of moisture.

Mr. HORNER (*Acadia*): I am aware of that.

Mr. FRASER: 23.3 millions was naturally dried by means of blending.

Mr. HORNER (*Acadia*): Who would get the advantage of the drying by natural means? On the tough wheat you are docked four per cent.

Mr. McCONNELL: I would say the terminal got the advantage.

Mr. BAXTER: The procedure there is that the terminal must negotiate with the wheat board in the buying and selling proposition. They must buy the damp and they must adjust with the wheat board. In the final analysis they get an arbitrary allowance established by the wheat board which represents roughly their cost of the drying, less the shrinkage. There is the loss of moisture; they do not end up with the nine cents spread.

Mr. HORNER (*Acadia*): I do not envision that you dry by natural means any damp wheat. In other words the terminal gets paid.

Mr. BAXTER: Both get a little.

Mr. HORNER (*Acadia*): But there is a terminal mixing within grades.

Mr. BAXTER: Within the tough and straight of that grade. It cannot be tough 3 and straight 2.

The CHAIRMAN: We will proceed to the paragraph headed eastern elevator handlings.

Mr. MACLEOD:

Eastern Elevator Handlings

Export shipments through the Eastern elevator section of the Canadian system continued to decline insofar as Canadian grain was concerned. Total clearances for the 1959-60 season amounted to 118.6 millions, made up of 93.6 millions through St. Lawrence river ports and 25.0 millions through the Maritime ports of Saint John and Halifax. The river port loadings were 14.5 millions below 1958-59 levels, while the Maritime sector dropped behind by 6.1 millions. The declines were fairly proportioned between ports. The volume of Canadian grain moved through all eastern elevators to supply Eastern Canadian domestic needs and for milling for export held relatively steady at 118.5 millions.

The impact of the seaway on the eastern handling pattern was reflected directly in the sharp reduction in the transfer movement (principally at lower lake ports) which dropped from 151.4 millions in 1958-59 to 97.6 millions in 1959-60, as 73.7 millions of grain moved direct from the Canadian lakehead to the St. Lawrence river ports in contrast to only 28.5 millions in the previous year. The handling of U.S. grain for reloading to ocean vessels, chiefly through Montreal, totalled 20.9 million bushels during the crop year. The eastern elevators also moved 10 millions of U.S. grain to Canadian domestic channels and transfer shipped a further 1.2 millions back to Eastern U.S. points.

The winter movement through Halifax and Saint John did not appear to be adversely affected by the seaway. The decline of 6.1 millions was roughly proportional to the falling off in exports of Canadian grain from the St. Lawrence ports. The trial movement of grain from the head of the lakes to maritime ports by the all-water route was further expanded from .4 millions in 1958-59 to 3.8 millions in 1959-60. The bulk of this grain was for domestic use, although a portion was unloaded at Halifax for storage for subsequent export.

Mr. HORNER (*Acadia*): In the middle of the paragraph you say:

The Eastern elevators also moved ten millions of U.S. grain to Canadian domestic channels.

What do you mean by U.S. grain; what particular grains are you referring to?

Mr. McCONNELL: I would say that ninety per cent of it is corn.

Mr. BAXTER: The balance would be soybeans.

Mr. HORNER (*Acadia*): It appears evident that with the St. Lawrence seaway there is less and less grain moved over the railroad from the Georgian bay ports. Do you expect this to continue to drop, or has it been levelling out?

Mr. BAXTER: It has levelled out. In 1958-59, during the first ten months there was 40.8 millions moved in this way; in 1959-60 there was 48 million; in 1960-61, the current crop year, there was 39 million, which is back to the 1958-59 level. It is reasonably steady. To a certain extent it is governed by the flow of boats in and out of the river ports at the outset and closing of the season. It is a question of whether the lake vessels can move it down fast enough.

Mr. HORNER (*Acadia*): Can you inform the committee whether or not the freight rate increase that the railways wanted to put on this grain movement was granted.

Mr. McCONNELL: It was delayed.

Mr. HORNER (*Acadia*): Has it been granted now?

Mr. McCONNELL: Not to my knowledge.

Mr. BAXTER: Not for the current season.

The CHAIRMAN: We will proceed to the paragraph "exports".

Mr. MACLEOD:

Exports

Canada exported 234.7 million bushels of wheat, 37.4 millions of wheat flour (wheat equivalent), 5.6 million bushels of oats, 57.7 millions of barley, 4.5 millions of rye, and 12.5 million bushels of flaxseed during the 1959-60 crop season. Exports of the five principal grains, together with the grain equivalents of wheat flour, totalled 352.4 million bushels, some 26 million bushels below last year's clearances but still well above the 30-year average for Canadian grain exports calculated at 314.5 millions. Compared with 1958-59 clearances, declines were registered in wheat (17.5 millions), oats (1.4 millions), barley (6.7 millions) and flaxseed (1.8 millions), while export shipments of wheat flour and rye were heavier by .3 millions and 1.3 millions, respectively. On the basis of international grain movement estimates compiled by the cereal section of the food and agriculture organization in Rome, Canada's exports represented 22.4 per cent of the world trade in bread grains, and 18 per cent of the trade in oats, barley and flaxseed.

Mr. RAPP: You gave the figures for the five principal grains. Have you any figures in respect of the export of rapeseed? This is very important, because we like to know the percentage of rapeseed that has been grown which is exported.

Mr. BAXTER: In 1959-60 the volume of rapeseed exports was 2.9 millions.

Mr. RAPP: What is the percentage in relation to the total crop?

Mr. BAXTER: I would estimate it would be close to the bulk of it; almost the entire crop.

Mr. RAPP: This is very valuable information to have on the record. Practically 95 per cent of this grain is exported.

Mr. McCONNELL: I would say that is correct.

Mr. HORNER (*Acadia*): I understand that this is for the 1969-60 crop year. How are wheat exports holding up for the present year, 1960-61? Do you have any figures on that.

Mr. BAXTER: To June 14, overseas clearances of wheat were 265 million compared to 208.7 million at the corresponding date a year ago. In addition to that 2.4 million have been imported by the United States in comparison to 1.9. The overseas clearances of oats were 1.1 as compared to 4.3; this is a reduction. To date, barley is 21.6 for overseas as compared to 40.7 in the corresponding period last year. With barley, there is a further 9.8 which has been imported by the United States as compared to 12.6 during the corresponding period a year ago. The rye exports overseas to date are .9 millions which is roughly double the volume a year ago. The U.S. figure for imports is 1.1 to date compared to 2.3. Imports into United States of rye from Canada normally occur in bulk right after the close of the U.S. crop year which is at the end of this month. Flaxseed exports were 10.4 million bushels in 1960 and 12.5 million bushels in 1961.

Mr. RAPP: How many pounds of rapeseed are in a bushel, for commercial purposes. I know the commercial market has adopted the fifty pound bushel, but I believe officially there are sixty pounds per bushel.

Mr. BAXTER: For statistical purposes we use fifty pounds.

Mr. FORBES: Does the total figure in respect of exports include gifts under the Colombo plan.

Mr. McCONNELL: That is the total export. I think 267 million bushels is the figure.

Mr. BAXTER: 272 million bushels for the crop year.

Mr. FORBES: Does that include seed exported to the United States?

Mr. BAXTER: In addition to that figure there was a total of 5.6 million bushels of seed wheat exported. The major portion—4.4 million bushels—was to the United States. In addition to that there was 1.1 million exported to Arabia. That is bagged seed wheat.

Mr. HORNER (*Acadia*): Recently I believe there were imports of wheat into Canada. Does the board of grain commissioners have anything to do with that. I believe there were imports in the order of something like ten million bushels into the interior of British Columbia on a trade deal.

Mr. McCONNELL: I never heard of it.

Mr. HORNER (*Acadia*): I think it was in connection with a barter deal involving iron ore.

Mr. BAXTER: That would be in respect of consolidated mining and smelting. I have no knowledge of that.

The CHAIRMAN: Are there any further questions on exports?

Mr. McCONNELL: I do think the question Mr. Forbes raised is useful. I have tried to keep in my head that three years ago there were 315 million bushels of wheat and flour and two years ago 292 million bushels of wheat and flour; and this particular year 267 million, until June 16 of wheat alone. It would appear this year we should go up 340 or 350 million bushels.

Mr. FORBES: Possibly over the three hundred million bushels.

Mr. McCONNELL: Yes; maybe 340 million.

Mr. MACLEOD:

Domestic Usage

Canada's farms and industrial plants absorbed a total of 777.5 million bushels of wheat, oats, barley, rye and flaxseed, for feed, seed and manufacturing purposes in 1959-60. This represented a slight decline from the previous year's consumption and a temporary halt in the progressive expansion which has been the pattern since 1954-55. The bulk of this disappearance was direct from farm stocks, either on the farm on which the grain was produced or through a farmer-to-farmer sale. The industrial portion, that is the total quantities used for milling for human use, for malting and distilling, and for oil crushing, held steady at approximately 75 millions for the crop year. The domestic consumption totals for the individual grains, all purposes combined, have been estimated as follows, with 1958-59 comparative totals in brackets: Wheat 152.8 (173.4), oats 438.5 (429.8), barley 174.5 (170.4), rye 4.8 (6.9), and flaxseed 6.9 (7.6), all millions of bushels.

The CHAIRMAN: Are there any questions?

Mr. HORNER (*Acadia*): My question on usage might have been asked a little too early, but I think I got my answer then, unless Mr. Baxter has something he would like to add to what he said.

Mr. MCCONNELL: I would say that the significant thing in the last four crops is that we have been producing about one billion bushels of grain, of which around 400 million have been wheat. We have not added greatly to our carry-over of surplus wheat in these last four years. You will realize that if we used as much as 150 million bushels for domestic, and if we sell around 300 million bushels for wheat and flour, we are pretty well disposing of our current production.

Mr. HENDERSON: The picture has changed in western Canada. Today every farm has a feed lot for feeding cattle. But that was not the case years ago. For example, in the Peace River country there are large numbers of cattle being fed.

Mr. FANE: Please do not forget Alberta. You have heard of that province?

Mr. HENDERSON: Oh, that is just a suburb to the Peace River.

The CHAIRMAN: Let us proceed with "carry-over".

Mr. BOULANGER: What is the proportion of grain going to the east as compared to grain going to the west? What is the proportion going to the eastern part of Canada?

Mr. MCCONNELL: I would say that 10 to 15 years ago, practically all the grain from western Canada went through the lakehead, and from there on to the Atlantic; but in the last 10 to 15 years, the west coast has been taking almost as much as the St. Lawrence river, in addition to the 21 million bushels going out of Churchill. But we always feel that it is a satisfactory year if we can handle 300 million bushels going east through the lakehead to eastern and Atlantic customers and feeding stations.

Mr. BOULANGER: I am talking about feed grain.

The CHAIRMAN: I think Mr. Boulanger's question was: what amount of grain was going for domestic use, and what amount of grain was going east.

Mr. MCCONNELL: Do you have the figures, Mr. Baxter?

Mr. BAXTER: Dealing with wheat we have a total domestic usage of approximately 150 million bushels, or between 150 million and 160 million; and approximately 63 million of it is used on western farms.

Mr. FORBES: I think the answer would be found if you took the number of bushels which were receiving government subsidy for freight to eastern Canada and deducted it from the total; I think that would give you the amount going into feed.

Mr. BAXTER: I do not have that figure, because we do not table it; but I can obtain it for you for the record later on.

Mr. BOULANGER: We purchase 100 million bushels of grain for feed purposes in the east.

Mr. BAXTER: The figure is 83,506,490 bushels.

Mr. HORNER (*Acadia*): I think it would be closer to 200 million, just taking a rough figure, because if there is a \$6 per ton subsidy, and if it comes to 21 million bushels for eastern Canada, this would figure out, if it were all wheat, to 200 million bushels.

The CHAIRMAN: Perhaps Mr. Baxter will have the figures for us this afternoon.

Mr. MILLIGAN: Do you have the amount of grain shipped to eastern Canada for feed purposes? I do not mean the grain that is going into elevators for export, but rather the grain which is going for domestic consumption in eastern Canada.

Mr. PETERS: Would it not be the difference between 150 million and 160 million used in the west?

The CHAIRMAN: I think Mr. Baxter will have the figure for us this afternoon.

Mr. FANE: That is, the figures on domestic usage?

The CHAIRMAN: Yes.

Mr. FANE: I would like to ask if there is any record of the amount of grain that was bought by the feed mills in that year. I mean the year 1959-60 that we are talking about.

Mr. McCONNELL: Could you answer that Mr. Baxter? Have you any record of the amount of grain bought by feed mills in the year we are discussing?

Mr. BAXTER: No, I have no record of that.

Mr. FANE: Have you no record even of what went to the mills under contract with the Canadian wheat board?

Mr. BAXTER: Yes, I would have that figure; I can get it for you.

Mr. FANE: But as to the other you could not estimate what went into local consumption, or was boot-legged?

Mr. BAXTER: No, as I mentioned before, I know the wheat board is compiling a figure on that, as to what is now represented by non-quota handlings of these unlicensed mills.

Mr. FANE: Can you tell us the amount that the licensed mills bought?

Mr. McCONNELL: We only have four licensed feed mills. Do you have the figure, Mr. Baxter?

Mr. BAXTER: I can get that figure very shortly.

The CHAIRMAN: Let us proceed in the meantime with "carry-over".

Mr. MACLEOD:

Carryover

Notwithstanding the declines in both exports and domestic usage, the combined disappearance total of 1,129.9 millions still exceeded new production by 47.1 millions and reduced the annual carryover, all grains, by this amount. This represented the third consecutive reduction in Canada's year-end grain holdings following the record carryover of July 31, 1957 (1,120.3 millions). The 763.5 millions indicated by elevator

returns and estimates of farm-held stocks as either in store in licensed elevators or farmers' bins or in transit between positions on July 31, 1960, reflected reductions in the carryover of all grains shown by the following comparative figures, with 1959 totals in brackets: wheat 537.6 (549.0), oats 92.8 (119.0), barley 121.5 (128.2), rye 6.8 (7.9), and flaxseed 4.9 (6.5), all millions of bushels. The total quantity held in licensed storage positions remained steady at 539.3 millions with the heavier year-end stocks of wheat offset by reduced visible holdings of oats and barley. The lighter carryover again was largely attributable to smaller farm stocks of wheat (81.7 millions compared with 130.0 millions on July 31, 1959).

Mr. HORNER (*Acadia*): Is this the amount which is estimated to be on the farms, this 81.7 millions?

Mr. McCONNELL: That is right. Those were wheat board figures confirmed by the dominion bureau of statistics.

Mr. BAXTER: I am sorry to contradict, but they were dominion bureau of statistic figures which were confirmed by the wheat board.

Mr. HORNER (*Acadia*): On July 1, 1959, there was only 81.7 million bushels?

Mr. McCONNELL: That is right.

Mr. HORNER (*Acadia*): So there is a very good possibility that this year it will be lower yet, having regard to increased exports?

Mr. McCONNELL: Do you have an answer to the last question showing how much was on the farms?

Mr. BAXTER: 259 million.

Mr. McCONNELL: There is quite a bit to come out yet.

The CHAIRMAN: Let us turn now to "licensing and bonding".

Mr. BAXTER: Let me say first of all that the usage of oats and barley by interior licensed mills, according to the marketing figures for 1959-60, was 5.4 million for oats and 9.2 million for barley. That was moved by licensed interior and private mill elevators.

Mr. FANE: What about wheat?

Mr. BAXTER: Wheat was 47.2 million; but this figure includes actually milling flour both for domestic sales as well as for export purposes.

Mr. FANE: What about the feed mills?

Mr. BAXTER: My figures do not distinguish them in that respect.

Mr. FANE: I only meant the mills that were licensed.

Mr. BAXTER: Our figures cover both.

Mr. McCONNELL: Would the wheat board have these figures?

Mr. BAXTER: I believe so.

Mr. McCONNELL: As I recall it, are not all these feeding stations now required to report their operations to the board, upon request?

Mr. BAXTER: Yes, they are.

Mr. McCONNELL: So some time next year they should have a complete picture of all the grain delivered to the feed stations.

Mr. MUIR (*Lisgar*): Would it not be better, Mr. Chairman, for us to hear the wheat board before we hear the board of grain commissioners? I say that because we are asking a lot of questions which I am sure should be asked of the wheat board. I think we would get through our program a lot quicker if we heard the wheat board first.

The CHAIRMAN: Let me explain why this happened this way this year; in previous years the wheat board always came before the board of grain commissioners, and many of the questions which are probably being asked of the

board of grain commissioners, were asked of and explained by the wheat board. But this year the supplementary report of the wheat board was only tabled on Wednesday; and due to the shortness of time, and the probable number of days left, we thought it advisable to have the board of grain commissioners here today and the wheat board next week, because the report of the board of grain commissioners had already been tabled some time ago. That is the reason we reversed the procedure this year.

Mr. MUIR (*Lisgar*): Well, if we get answers from the board of grain commissioners, we will not need to ask the same questions of the wheat board, so it will amount to the same thing in the end.

Mr. BAXTER: Now, as to the question on the movement of Canadian western grain through eastern elevators, for eastern domestic use—

Mr. MANDZIUK: I mean for feed purposes; because by domestic, we might take it to mean flour. The question is related to the use of feed on farms.

Mr. BAXTER: That is right. The breakdown we have is from the eastern elevators, and it is fairly distinct in that regard; we have the breakdown to industrial plants, and to flour mill production. The figures I give will be what I estimate to be the grain going to domestic feeders and feed plants. The figure for oats is 29.3 million; and for barley 28.5 million.

Mr. BOULANGER: What is the figure for wheat?

Mr. BAXTER: For wheat the figure is 20.2 million.

The CHAIRMAN: Are there any further questions before we proceed to the next paragraph? If not, let us now go to "licensing and bonding".

Mr. MACLEOD:

Licensing and Bonding

The total licensed storage capacity at July 31, 1960, was 639,054,610 bushels—631,884,110 bushels in elevators and 7,170,500 bushels in grain storage buildings authorized as supplementary annexes to country elevators. Licences were in effect for 5,413 country, terminal, mill and eastern elevators, a decrease in capacity of 2,891,640 bushels and in licences of 15 compared with corresponding figures as at July 31, 1959. Country elevator capacity was reduced by 16.2 million bushels while terminal and eastern elevator facilities were augmented by 17.4 million bushels of new space including the construction of a complete new elevator at Baie Comeau.

Mr. PASCOE: Mr. Chairman, in connection with this paragraph, I am surprised to see that there is a decrease in the capacity. What is the reason for that 2,891,640 bushel decrease.

Mr. McCONNELL: Will you answer that question, Mr. Baxter?

Mr. BAXTER: Mr. Chairman, during the 1959-60 season, more particularly from January forward, the Canadian wheat board country operations department and our own organization conducted a joint survey of all the country facilities in western Canada. It was handled through the companies. The individual country elevator agents were, I suppose, collaborating on this, and they agreed as to their capacities. As a result of this, there was a substantial reassessment of country elevator capacities at that time, which is reflected in this return. It was in conjunction with the wheat board order No. 1000.

Mr. PASCOE: There was a decrease of 15 licences. Were the licences cancelled?

Mr. BAXTER: They would be country elevators which were dismantled.

Mr. McCONNELL: Some of them were turned into annexes. Would you not agree that the 16 million reduction is largely a book figure?

Mr. BAXTER: Definitely. As far back as 1942 there was a certain amount of jockeying with the record figure of the country elevator capacities, and it was difficult to assess the exact physical capacity. I think we have it now.

Mr. PASCOE: You mentioned here authorization as supplementary annexes. Did the board authorized those?

Mr. McCONNELL: Yes. There were 14 million bushels in rinks and hangars, and buildings of that nature, in 1956. A year ago, the figure was 7 million, and the present wheat board's intention is that it will all be moved out this year.

Mr. PASCOE: In connection with that I notice that quite a few of the old roundhouses are being used, now, for storage. Are you keeping close check on them?

Mr. McCONNELL: Yes. They are all licensed under our board.

Mr. PASCOE: Do they have to empty them when they are called for?

Mr. McCONNELL: Yes. They have to be on a railway line, and our assistant commissioner inspects the facilities. After all, we do not need to be too much concerned, because the grain itself is the consideration of the company. But then, they have to have permission from the wheat board to move the grain in.

Mr. PASCOE: I saw one report where they are filling one roundhouse, and hope to store the wheat there for five years.

Mr. McCONNELL: That has nothing to do with us; that would be an agreement they make with the wheat board.

Mr. HORNER (*Acadia*): Could you give the committee some idea as to how many roundhouses are being used for the storage of wheat?

Mr. McCONNELL: I would guess that there are ten or twelve, right now.

Mr. BAXTER: I believe the figure is nine.

Mr. HORNER (*Acadia*): The reason I ask this question is because I have good reason to believe that the C.N.R. is renting them reasonably. In fact, they are losing money by renting them as cheaply as they are, to the elevator company.

Mr. McCONNELL: Yes. I will say this: They clean up the floor and the pits where they service the engines. They fill these in, and put a false floor down. Also, they build another retaining wall three or four feet away from the outside wall. Therefore, it should be good storage.

Mr. MANDZIUK: What is the capacity of these?

Mr. McCONNELL: The one in Winnipeg holds 1 million bushels. However, normally, it is 40,000 to 80,000 bushels.

Mr. FORBES: Are the collections under P.F.A.A., the responsibility of the board of grain commissioners?

Mr. McCONNELL: Yes. Under the P.F.A.A. we collect it and turn it over to the treasury.

Mr. FORBES: You can recognize the large sales in connection with the export of seed grain, and as you know, there is quite a large order. However, the seed grower is obliged to pay field inspection, the cost of seed treatment, sacks, and all these things which amount to almost one-third of the price he receives. It seems to me there is discrimination there, and I think you should give consideration in respect to the setting of a price. I think the payment should be deducted on the basis of net price, rather than on the total price the seed grower receives.

Mr. McCONNELL: We discussed this as far back as three or four years ago. The first was Mr. Taggart, and then Dr. Barry. Would you explain the position we are in now, Mr. Baxter, with P.F.A.A.?

Mr. BAXTER: The requirement under P.F.A.A. is that it must be 1 per cent of the final purchase price; in other words, the net, passing through a licensed facility.

Mr. FORBES: Then the net price would not include the seed treatment, and son on?

Mr. BAXTER: There is an agreed allowance of a 5 cent to 10 cent deduction for the sack. However, beyond that, it was the thought of the department that the process of not only growing the seed, selecting it, handling and cleaning it, is comparable to that of a careful and efficient farmer giving the additional preparation to his land and being careful with his harvesting operation in attempting to grow top grade wheat. They feel there is that parallel there, and that is what they have, in turn, instructed us to do—that on all transactions of seed that pass through licensed facilities, the levy shall be based on the final purchase price, and that this allowance of 10 cents per bushel will be the only deduction.

Mr. MUIR (*Lisgar*): In the case of a seed grower who sells his grain to a seed house, he does not pay more than 1 per cent of what he receives from the seed house.

Mr. McCONNELL: He does not pay any if it is not licensed. We only collect through licensed facilities.

Mr. MUIR (*Lisgar*): But this is a licensed one.

Mr. McCONNELL: It is not licensed under the board of grain commissioners.

Mr. MUIR (*Lisgar*): Do you mean that all these cleaners are not licensed under you?

Mr. McCONNELL: No.

Mr. MUIR (*Lisgar*): Then, the farmer, in that case—

Mr. McCONNELL: Gets home free.

Mr. MUIR (*Lisgar*): Well, that is good news.

Mr. FORBES: In our part of the country, in regard to these businesses—Red River, and so on—all these costs are subject to include the 1 per cent levy.

Mr. McCONNELL: Yes, but they have subsidiaries who handle this seed without it going through the licensed facilities.

Mr. MUIR (*Lisgar*): My part of the country, being along the border, there are quite a number of these small seed-cleaning plants, and they buy the wheat from the farmers around. They buy the wheat from him, clean it, and export it to the United States. Now, the farmer does not pay 1 per cent on it.

Mr. McCONNELL: Not unless it is going through a licensed facility. If it is not licensed we would not know anything about it.

Mr. FORBES: I think your suggestion of allowing a seed handler to take 10 per cent off, because of processing, would be about right.

Mr. BAXTER: It is 10 cents.

Mr. FORBES: Per bushel?

Mr. BAXTER: Yes.

Mr. FORBES: Your levy is on a percentage basis?

Mr. McCONNELL: You see, Mr. Forbes, it is not our act; we are instructed under the P.F.A.A. to collect it from the net figure.

Mr. FORBES: Well, you could make recommendations.

Mr. McCONNELL: No.

Mr. MUIR (*Lisgar*): This wheat is sold in two-bushel bags; is it 10 cents on the two bushels, or one bushel?

Mr. BAXTER: On the bushel.

Mr. MUIR (*Lisgar*): That would be 20 cents on the bag, then.

Mr. BAXTER: I had not thought of that, sir.

Mr. FORBES: Let me point this out: There has only been one year in the last twenty years when you could buy bushel bags at less than ten cents, and that was two years ago. In other years it ran as high as 12 to 14 cents. The seed treatment costs you six cents a bushel—and that makes 16 cents. Your inspection costs you 2½ cents, and your final inspection, including tags and seals, run about 3¼ cents a bushel.

Mr. McCONNELL: But the board of grain commissioners has no jurisdiction at all over the grower of seed.

Mr. FORBES: But you have over this P.F.A.A.

Mr. McCONNELL: Yes, if it goes through a licensed facility.

Mr. HORNER (*Acadia*): Is the new elevator which is at Baie Comeau near Quebec?

Mr. McCONNELL: It is near Seven Islands, down the river.

Mr. HORNER (*Acadia*): Will it be able to operate all year round?

Mr. McCONNELL: Well, I think that was the idea when it was built. However, there was no winter cargo went out of it last year.

Mr. HORNER (*Acadia*): Was it in operation last year?

Mr. McCONNELL: Yes. Whether the insurance rates were so high that it did not operate, I do not know; however, there was no winter cargo that went out.

Mr. HORNER (*Acadia*): But it was thought when it was decided to build it there that it would operate all winter?

Mr. McCONNELL: Yes.

The CHAIRMAN: Gentlemen, it is nearly 11 o'clock, and probably this would be an appropriate place to adjourn until 2.30 this afternoon.

Our meeting this afternoon will be held in this same room.

AFTERNOON SITTING

FRIDAY, June 23, 1961.

The CHAIRMAN: Gentlemen, please come to order.

At adjournment time we finished with licensing and bonding.

Mr. HORNER (*Acadia*): I want to ask one quick question on this elevator at Baie Comeau. Who built it?

Mr. McCONNELL: Cargill Grain.

Mr. HORNER (*Acadia*): Is it American or Canadian?

Mr. McCONNELL: American owned. Government policy determined it would be 40 per cent American and 60 per cent Canadian for operating.

Mr. HORNER (*Acadia*): How much does it hold?

Mr. McCONNELL: Eleven million eight.

Mr. HORNER (*Acadia*): Does the government pay storage on the grain stored in these elevators?

Mr. McCONNELL: Yes, if it is wheat board grain.

Mr. HORNER (*Acadia*): Is it wheat board grain?

Mr. McCONNELL: Yes, they are putting some board grain through.

Mr. FORBES: What is the largest terminal we have?

Mr. McCONNELL: That would be it, 11 million bushels. It is the largest single terminal. But the national harbours board would have more in total, 16 million in four different units.

Mr. FORBES: What about the ones they have in Fort William?

Mr. McCONNELL: Nine million bushels.

Mr. MUIR (*Lisgar*): Mr. Chairman, just before we go down to questioning the witnesses, I would like to point out that we are going to be through here at 4.45; the bell is going to ring at that time. I was wondering if we could not probably get on with it so that we can let these gentlemen go home at that time?

The CHAIRMAN: I was going to mention the fact. We expect a vote will be taking place at 4.45, so I hope we can have the co-operation of all the members of the committee and endeavour to finish up with our witnesses at that time. I know they would desire it, and I hope everyone will co-operate in an endeavour to finish that up.

Mr. McCONNELL: I would like Dr. Gray to stand up. He is our entomologist living in Ottawa and looking after all the bugs in elevators across Canada.

Mr. HORNER (*Acadia*): One more question on this Baie Comeau elevator. As I understand it, the Americans built it. Did they choose the site?

Mr. McCONNELL: Yes.

Mr. HORNER (*Acadia*): Apparently it has not been too successful for winter shipping.

Mr. McCONNELL: There has been no winter shipping. They just could not get a charter for the winter months. Whether it was the insurance rate or not, I do not know. You can ask the wheat board that.

Mr. BOULANGER: I would like to ask a question regarding the licence and storage in Montreal, in the eastern part of Canada. Is it the board of grain commissioners or the wheat board who are responsible for the quality of the grain stored in these elevators?

Mr. McCONNELL: You mean the maintenance of the quality? That is the problem of the terminal elevator management.

Mr. BOULANGER: Who is that?

Mr. McCONNELL: Whoever is running the terminal, and then we will inspect it on shipping for export.

Mr. BOULANGER: What I want to know is why there was no feed grain in these elevators for the eastern terminals last fall? It was export quality grain.

Mr. McCONNELL: We have provided for that, sir, and the elevators are licensed for so many bushels according to their capacity. I will illustrate it. The harbours board has 16 million of space in Montreal and we license them for 12 million space. It changes in certain months of the year. That leaves them free to do as they like with the portion that is not licensed. In other words, by the terms of their licence we relieve them of operating the full amount of bushels for our board. That should take care of domestic feeds or milling wheat, or anything of that nature.

Mr. BOULANGER: But due to the fact that they are paid for storage of export grain, do you not think that these elevator owners are more interested in having export grain than feed grain?

Mr. McCONNELL: They could be.

Mr. BOULANGER: That is what happened last year in the east. They did not have any grain. It is still the same thing this fall. Do you know what is happening? They are importing corn from United States, and they are \$12 less for

wheat, less \$5 for premium subsidies on transport, which comes to \$7 less than No. 4 wheat. So the elevators in the west are full and we are going to the United States to buy the corn. We buy 50 millions of corn in Montreal market this year.

Mr. McCONNELL: The elevators in the west are not full of No. 4, 5 or 6 wheat. I think the wheat board will tell you they are rather short of those grades.

Mr. BOULANGER: If they are short, they could sell a higher grade at a lower price, to get in with the corn, so that we will get a greater amount of wheat.

Mr. McCONNELL: Again, I do not like to tell you this, but this is not a matter for the board of grain commissioner. We do not sell the grain nor do we move the grain into position.

Mr. BOULANGER: I did not know exactly whether it was your responsibility or that of the wheat board. Possibly I could put that to the wheat board.

Mr. NASSERDEN: Could you tell us if any American grain has been handled through any of our Canadian terminals?

Mr. McCONNELL: Oh yes.

Mr. NASSERDEN: Has it been very substantial?

Mr. McCONNELL: No. The total amount of American grain last year was 33 million bushels.

Mr. NASSERDEN: Do they charge the same fee for American grain going through, as for Canadian grain going through the United States?

Mr. HORNER (*Acadia*): How do you get this figure of 33 million bushels, when on an earlier paragraph it says 10 million bushels of grain—eastern.

Mr. McCONNELL: I think you are dealing with the report now. Mr. Boulanger asked for last year's figures. We are dealing with 1959-60 in the report. The difference in the figures is due to the question. Mr. Boulanger asked how much last year, and I told him it was 33 million bushels.

Mr. BAXTER: It was 36 million in total. Thirty-three million was the total for overseas shipments.

Mr. HORNER (*Acadia*): How does that tie in with the 10 millions in the report on page 8, which we have already covered?

Mr. BAXTER: That is domestic wheat.

Mr. FORBES: Mr. Nasserden asked how much American grain was stored in Canadian terminals. What is the reverse figure—how much Canadian wheat is stored in American terminals, and do they get the same storage rate as in Canada?

Mr. McCONNELL: Very little.

Mr. BAXTER: On June 14 there was only 392,000 of Canadian rye. That was all of the Canadian grain that was in store in American elevators as such. There were quantities of Canadian in store in Buffalo that had been taken in in bond, and then moved over to the mills. It was out of trade entirely at that point.

Mr. FORBES: But normally we do the storage, and we have got a negligible quantity in American elevators?

Mr. McCONNELL: That is right. Only since the late 1940's.

Mr. MUIR (*Lisgar*): Why do we store it? Why are we worried about the American wheat position?

Mr. McCONNELL: After all, it is a cooperative enterprise—the Seaway was not only for Canada but for the United States. We felt it was in the interest of the Canadian grain trade, as long as western grain was not prohibited from being handled efficiently, and to the full amount required. Also, on account of the earnings accruing to the Canadian companies who handled the grain, it is better for us to make maximum use of the Canadian facilities rather than engage

in the building of American storehouses. That was the basis, I think, on which the government decided that on new construction it would be based on 40 per cent American use and 60 per cent Canadian use.

Mr. MUIR (*Lisgar*): I see.

Mr. McCONNELL: At no time, Mr. Muir, has it hindered the movement of Canadian grain. We have a delay period of two weeks after the official opening, before American grain can be brought in. That gives the wheat board, or any customer, ample time to get stocks down to meet his commitments. Again, we have a prohibition of any American grain entering the system for winter storage after the 31st day of October.

Mr. MUIR (*Lisgar*): Any American grain in store?

Mr. McCONNELL: Except in the proportion that comes in, 40 per cent to 60 per cent. Therefore, I think it is a fairly cooperative setup.

Mr. MACLEOD:

Assistant Commissioners

Through its four Assistant Commissioners, the Board kept in close touch with the operation of licensed country elevators in the Western Division. During the year 1960, the Assistant Commissioners inspected 683 elevators in Manitoba, 1,098 in Northern Saskatchewan, 981 in Southern Saskatchewan, and 1,437 in Alberta, a total of 4,199. This inspection included checks on scales, sieves, moisture meters and certain other equipment; deductions for shrinkage and Prairie Farm Assistance Act Levy; and posting of current Board Regulations applying to country elevators.

Complaints originating from country points totalled 11, as compared with 19 in the previous year.

Disposition of complaints investigated was as follows:

	Manitoba	Saskatchewan	Alberta	Total
No grounds for complaint	—	—	1	1
Settlement effected	—	2	5	7
Complaint withdrawn	1	2	—	3
TOTALS	1	4	6	11

The Assistant Commissioners received and handled numerous inquiries on various matters related to country elevator operation. They also discussed accumulated overages with elevator agents concerned.

Mr. RAPP: Mr. Chairman, I think my question comes under this item. It has to do with sieves. This is apparently a problem with rapeseed producers. Last year we had a wonderful crop, but the sieves used to determine the dockage were such that last year, when we had little, smaller kernels—it was a wonderfully good crop but with smaller kernels—according to the sieves we were supposed to use, some of our dockage would have been from 20 to 25 per cent. Many complaints came to me, so I informed Mr. Milner, and I got a letter from him saying that he would have to check into it.

I think something will have to be done about these sieves. Years ago when they brought in these sieves we used the Argentine variety, which has much bigger kernels than the Polish. So I think the board of grain commissioners will finally have to look into it and decide what sieve to use.

Mr. P. FRASER (*Assistant Chief Grain Inspector*): At the present time we are using 3 types of sieves.

Mr. RAPP: I know there is a number on the sieve that we are using.

Mr. FRASER: The first one, the primary one, is a 4 x 20 mesh per inch wire sieve. The second is a 6 x 21 mesh per inch wire sieve. The third one is a 4 x 22 mesh per inch wire sieve. So far these selections of sieves for the separation of dockage material are such that commercial channels have been able to duplicate them in commercial installations.

Mr. RAPP: I think they use the 4 x 22 sieve to determine the broken kernels and the small kernels, but I think for the kind of rapeseed we are using now, that is, the Polish rapeseed, this sieve is not good, and you will hear some complaints from the older people, just as you used to hear them from Saskatchewan, because there will be much more rapeseed produced, and with the Polish rapeseed there is a difference. So I appeal to the board to look at these sieves and to have something brought in to remedy the situation and put an end to the complaints. Naturally when you use a sieve to determine whether it is No. 1, and 35 per cent comes through the sieve, it is almost ridiculous.

Mr. FRASER: This is a matter which is constantly under consideration and study by the board. It is a daily obsession with us that we duplicate in our inspection method those sieves which are practical in commercial usage. As a matter of fact, I am not above complimenting ourselves for one moment, because I think we have given a measure of leadership to the industry in the selection of sieves which we have so far adopted.

Mr. HORNER (*Acadia*): I have a question on a little different subject. I see you have complaints, and I wondered if you could perhaps give the committee some idea as to what these complaints constitute, and who then were made against,—the elevator companies, the elevator agents or against the farmer himself.

Mr. McCONNELL: I would say that 90 per cent of the complaints originated from farmers who shipped a car of malting barley when it was turned down on account of peeled and broken, and was not accepted by the maltsters.

Mr. ROGERS: Who would inspect it? Who is responsible for inspecting that malting barley? The maltsters?

Mr. McCONNELL: No. The sample comes in from the farmer, and if it is accepted, then the wheat board gives a permit for the farmer to load a car of malting barley, and he will bill it to a certain place. But if it is not accepted—we changed it last year to make it a little more acceptable, from 5 per cent at the country level to 4 per cent; but if the car is still turned down, then it becomes a carload of feed barley, and that is it.

Mr. ROGERS: Is there anything you can do to improve that position?

Mr. McCONNELL: Frankly, we have not cured the problem. We admit that we did try to do so last year; but the percentage basis is not the answer in the handling of malting barley. We never did have any trouble in Alberta before. Mr. Gordon Harold, who is here, will substantiate what I say. This year they are in just as much trouble with malting barley at the west coast as we have been at the lakehead.

Mr. ROGERS: The consensus seems to be that so long as the supply is there they are pretty tough, and when it is not there they are a little more reasonable.

Mr. McCONNELL: It is a competitive buyers' market at the present time. If they can select a better car, I do not know what you could do about it. It is, however, certainly more satisfactory.

Mr. SOUTHAM: Last year this committee had a discussion about inspection and grading of grain, concerning testers and meters. We heard complaints to the effect that there was not a uniform standard of meter being used and that

there were a lot of occasions where there had been breakdowns and interruptions in service. We made the suggestion that there should be uniformity of meters and a set-up for repairs.

Dr. I. HLYNKA (*Assistant Chief Chemist for the Laboratory, Board of Grain Commissioners*): We did survey the precision of accuracy of these meters throughout the country. There were some forty-five hundred of them. This was done largely through the services of the assistant commissioners, particularly in Manitoba and Saskatchewan. In addition to that we maintained a constant check on the meters at our own inspection points. The companies located at the inspection points—the head offices—checked their meter against ours and then also checked their country elevator meters against their head office meter, which had been checked with ours. The accuracy of these is quite satisfactory. Ninety per cent of the meters used in the country elevators were accurate to within .3 of one per cent.

Mr. SOUTHAM: I would assume then that you are getting very few complaints in this connection, and in respect of service.

Dr. HLYNKA: Very few complaints. We have weekly or every second week service to our inspection points. Our meters are constantly under check and supervision.

Mr. SOUTHAM: Thank you.

Mr. McCONNELL: I might say that the suggestion to check the meters came from this committee, and that is the action which has been taken.

Mr. MUIR (*Lisgar*): In respect of Mr. Rapp's question about the rapeseed, I think that if thirty per cent of the rapeseed is going through the sieve it is a little too much. It is due to the fact that the rape that is grown in our country is smaller than the Argentine rape. I might as well tell Mr. Fraser that Mr. Rapp will not let him sleep until he does something about this.

Mr. McCONNELL: I do think that if you get a sieve which will save all that, then almost inevitably they will be exporting a lower quality of rapeseed. I believe this is a seasonal problem in respect of the small seeds.

Mr. MUIR (*Lisgar*): Could you have one of your people go out at the start of the season and see what these sieves are doing, so that you know from first-hand what is happening.

Mr. McCONNELL: We will take that suggestion.

Mr. MUIR (*Lisgar*): I think Mr. Rapp would be pleased about that.

Mr. FRASER: We had an examination of fourteen hundred samples last year.

Mr. RAPP: These sieves have been used for the last ten years. At that time we had Argentine rape, which was the rape first brought into this country; the kernels are much larger. However, the small kernels put through the sieves here are sound kernels; they are only smaller in size.

Mr. FRASER: In 1958 on a suggestion from Mr. Rapp six by twenty-one mesh per inch sieve was put into practice.

Mr. FORBES: I just want to add a word or two to what Mr. Rogers said in respect of malting barley. A few years ago while we were having wet seasons at Dauphin a lot of our barley was accepted, but now they are looking for low protein barley and are looking for areas which have had a wet season. These malting companies are highly selective now.

Mr. HORNER (*Acadia*): Do most of the companies arrange with the elevator agent to take a sample and then claim that his sample is not borne out by the carload lot?

Mr. McCONNELL: The carlot sample is final; but if the farmer is dissatisfied the agent is supposed to retain a sample of the barley as it is delivered at the elevator and again a sample of the barley as it is loaded into the car.

If the farmer is dissatisfied and sends in a request that he wants his car reviewed, the box comes in and the farmer sends the key in separately, and the sample is reviewed in the box. It will stand up to the grade sometimes; however, you cannot force the maltster to take the car of barley.

Mr. HORNER (*Acadia*): Why not, if he has accepted it in the first place and the grade holds up to be a true sample?

Mr. McCONNELL: As a rule, that kind of car is not turned down. However, as a rule, the more handling, the greater the increase in the peeled and broken. It is about one-half to one per cent in every operation.

Mr. HORNER (*Acadia*): What are most of the cases in which malting barley carloads are turned down?

Mr. McCONNELL: The unloading sample is not as good as the sample sent in the first place. I think I should state this, for the benefit of the companies. There are two malting markets. There is some feed barley purchased for malting purposes. This is used for the lower quality malting market, and you will appreciate that the maltsters would use this lower quality feed barley to service this demand. However, by far the largest portions of the market is for the high quality 3 C.W. malting barley.

Prosecutions

One penalty in the amount of \$100.00 was levied against a licensee for failure to comply with instructions issued by the board.

The CHAIRMAN: Are there any questions on prosecution?

Mr. HORNER (*Acadia*): What was the cause of such a penalty, as levied here?

Mr. McCONNELL: I think it was \$100, and I believe it was an order of the board, was it not? It was a case of grain being removed from the storage building and no grain was to be returned to it. However, one company accidentally made a mistake and put 5,000 or 7,000 bushels back in, and this was the penalty they paid for so doing, because the wheat board is anxious to have all this shipped out. If we allowed grain to be put back in, we never would get it shipped out.

Mr. HORNER (*Acadia*): Who collected the \$100?

Mr. McCONNELL: The Receiver General of Canada.

Mr. ROGERS: Are elevator companies prone to keep this grain in outside storage?

Mr. McCONNELL: They have no alternative. Unless the wheat board orders the grain out and gives them cars under some particular order, they cannot move it until the wheat board finally orders it out and supplies the cars to do it.

Shortages and overages, country elevators

Country elevator companies were able to complete the weighover of stocks with respect to 2,101 elevators, some 300 more weighups than were made in 1958-59. A review of these audits indicated no significant changes in the pattern of overages and shortages from that which applied during the previous season as will be noted from the summary table shown below:

<i>Elevators reporting</i>	<i>1959-60</i>	<i>1958-59</i>
Shortages	585	534
Neither overages nor shortages	4	6
Overages of less than .25%	980	846
Overages of .25% to .50%	413	316
Overages over .50%	119	99
Total elevators weighed over	2,101	1,801

The board summoned 109 agents of country elevator licensees to appear at hearings held at Winnipeg, Regina, Saskatoon, Calgary and Edmonton, in connection with excessively high overages. At these sessions, members of the board interviewed the agents and examined records concerning their operations in the presence of senior officials of the companies concerned.

Mr. McCONNELL: This is the old perennial story, and, as you might recall, I told you a year ago that in 1957 we had a weigh-over of 1,649 elevators by the various companies concerned. In 1958 the figure was 1,542 weigh-overs; in 1959 it was 1,801, and in 1960 we had 2,101.

I mentioned a year ago that until the time came that we could have more weigh-overs we would have some anxiety about our overage position, and I think this is pretty well borne out. You realize that, first, their agent is bonded and the elevators are licensed, and the percentage, throughout the years, gentlemen, I think was .05, .09 and .08. Now, gentlemen, that is about as close as you can weigh grain. If we keep it at this level and weigh over about 4,000 elevators a year we would not find much to worry about. In the 2,100 elevators, because the companies have not been able to weigh over the elevators, we have now some elevators weighing over that are less than three years. The grain has not been weighed for three years or less. Then we have in the group of elevators weighed over this year, in the total of 2,100, another group that was between four and six years, and a smaller group of elevators that went anywhere from six to ten, eleven and twelve years.

When you break this 2,100 elevators down on that basis, the percentage of the first group of 1,100 elevators is .014 per cent, and that is about as close as you can weigh grain. I may add that those gentlemen did a very good job on the country elevators because they never had too much help. There were 1,172 elevators in the next group which went from four to six years, and they came up with .145, which is still pretty good. If we could improve on them and get between .05 and .08, that runs about 54 pounds per 1,000 bushels, and that is very good weighing. In the 400 odd elevators in the six to twelve years group it increased to .206

You may remember what I said last year about the uncertainties of the agent in buying grain. He does not know how he stands in his house. His superintendent is after him not to be short, and if he goes six or ten years, this is the result. We are not happy about it but I am confident the agents as a whole are first class citizens. They have tried to do a very good job under very difficult circumstances. I shall ask commissioner Svoboda to tell you about this. He spent two weeks with commissioner Loptson interviewing 110 agents.

Mr. SVOBODA: There is not much I can add to what Mr. McConnell has said, but with respect to instructing the agents on how to cooperate with the farmers, in the last two years I have inspected some 1,600 elevators. They are responsible and respected citizens. They have the company on one side of them and they have this jump in overages on the other side, and they are trying to stay in line and do a good job. I do not want to condemn their efforts, because they are doing the best they can.

We are getting excellent cooperation from the companies concerned. They are going out of their way, particularly during the last two years, to train their agents and help them out in difficult times. Another matter I discovered during my last trip on inspection was that there is great difficulty over the large amount of damp wheat which agents had to handle last year, and some of the agents were new men. In 1959 there were a whole group of new agents and they got into difficulties. These large overages turned up mainly as the result of the extreme problem that resulted from the 1959 damp crop. That is all I have to say, gentlemen, thank you very much.

Mr. HORNER (*Acadia*): Why are there elevators going back four, five and six years which have not been inspected, especially since you inspect something like 1,600 elevators a year, and this year you inspected 2,100, and there are only 5,300 elevators in western Canada?

Mr. McCONNELL: You have to divide them up by years. We should like them to weigh over every year. Some of them are weighed every year and some every two years, but some have never been weighed for six, eight and twelve years. That is up to the companies.

Mr. HORNER (*Acadia*): I was under the impression they had to be weighed over every two years, and that it was up to the elevator companies.

Mr. McCONNELL: From where are you reading?

Mr. BAXTER: He is referring to the terminals.

Mr. HORNER (*Acadia*): I do not know where I read that.

Mr. McCONNELL: This is country elevators.

Mr. HORNER (*Acadia*): This does not apply to country elevators?

Mr. McCONNELL: No, I think we shall come to that point later. There is a stated time—every 22 months—when we must weigh up terminals. This is the country elevators and we keep pressing the companies to get a weigh over, and they do when oats and barley get short. They will take a weigh over check of their oats and barley, but wheat is generally stored in the annexes. The overall picture seems a lot of bushels, and you will get the total bushels in the wheat board report; but when you relate the amount of bushels in the wheat board report to the total amount of wheat which the wheat board receives, it works out at about $\frac{1}{2}$ of 1% on the total, and that is not bad.

Mr. THOMAS: Mr. Chairman, in confusing shortages and overages is any allowance ordinarily made for moisture content of grain?

Mr. McCONNELL: They have three-eighths of 1 per cent of a shrinkage to work on all the time at the country elevator level, and if it is damp grain the shrinkage goes up to half of one per cent; so the agent can really accumulate bushels if he looks after the shrinkage table. That is a safeguard so the farmer will get the full amount of pounds on the beam.

Our former boards of commissioners found, I think, a shrinkage of half of one per cent, proved to be too much, so the same board the following year reduced it to a quarter of one per cent, which again proved to be too little. There were too many agents coming up with shortages, and no company can afford to operate a line of elevators and run short. So I would say that for at least five or six years, as long as I have been on the board, the shrinkage has

been three-eighths of one per cent. That is protection for the agent to give the farmer good weights and not monkey with the beam on weighing. With different shrinkage allowances it runs to $1\frac{1}{2}$ per cent on flax and $1\frac{1}{4}$ per cent on oats and barley.

The CHAIRMAN: The next one is regulations.

Mr. MACLEOD:

Regulations

The following amendments were made to the Board's Regulations, effective August 1, 1960:

Regulation No. 5: The sections headed "Rejected" and "Sample" were revised to provide improved grade names for certain "off grades" of western grain.

Regulation No. 10: This was revised to make it applicable to licensed elevators at all St. Lawrence ports, rather than to Montreal only.

Regulation No. 18: Section 9 was revoked.

Mr. McCONNELL: These were all dealt with by the board, some after consultation with the companies, and they were all done to make less grades so that a greater advantage could be taken of binning space. Section 9 of regulation 18 on shortage bond had become obsolete anyway and it was removed from there. That is all the explanation required.

Mr. MACLEOD:

Committees on Grain Standards

A sub-committee of the Committee on Western Grain Standards met at Winnipeg on June 21, 1960, to consider problems relating to the grading of barley, and passed a resolution that several changes be made in grading procedure, effective August 1, 1960, including abolition of the commercial grade of No. 4 Canada Western Six-Row Barley.

The Board constituted Committees on Western and Eastern Grain Standards for the Crop Year 1960-61 as provided in Section 25 of the Canada Grain Act. Personnel of these Committees is listed in Appendix A.

A meeting of the Western Committee was held at Winnipeg on October 20, 1960. The members received numerous reports relating to quality of crops grown in the 1960 season and to various other matters in connection with grading of grain, and also selected and settled standard samples and standard export samples for various grades of Western grain.

The Eastern Committee met in Toronto on August 17, 1960, and in Montreal on October 26, 1960, and established standard samples for grades of grain grown in Eastern Canada.

Both groups authorized continued use of previously selected standard samples in instances where suitable recent samples for established grades were not available.

The CHAIRMAN: Any questions on that?

Agreed.

Mr. MACLEOD:

Inspection of Grain

Grain crops in Western Canada in 1960 were generally above average in both yield and grade. In the spring, moisture ranged from adequate to excessive; wet fields delayed seeding in many areas, and some 1959 crops that remained in the fields over winter were not threshed until May.

The wet spring started crops off well; bumper crops were anticipated, but subsequent prolonged drought reduced average yields of grain to

just above normal. Drought and heat caused some light weight grain across the southern parts of the three Prairie Provinces, and consequently some degrading; some crops that were sown late on account of the wet spring were damaged by fall frosts, particularly in the Peace River area, but exceptionally dry, mild harvest weather produced higher average grades than in several years. Broken kernels, the result of low moisture content, was a significant grading factor in many districts.

It was estimated that about 95% of the 1960 red spring wheat in Manitoba and Saskatchewan, and about 70% in Alberta, would qualify for Manitoba No. 3 Northern or higher grade. Similarly, Amber Durum wheat was generally No. 3 Canada Western or higher; blackpoint and smudge were the main reasons for durums not qualifying for No. 1 Canada Western generally. Thin kernels, from the drier southern areas, were conspicuous in the small amount of low grade that was harvested.

In the drier southern districts much of the barley had thin kernels, and frosts damaged some of this grain in the Peace River area, but a high proportion of the barley crop qualified for "malting" grades—No. 3 Canada Western and higher.

1960 crop oats generally had good test weight per bushel, and the fine fall weather produced good supplies of high grade, millers' quality of oats. The average quality of rye was good; No. 2 Canada Western was by far the predominating grade.

Flaxseed was generally No. 1 Canada Western, except for some light weight seed from the drier areas. Rapeseed production was estimated at more than three times over 1959, production having been stimulated by an increased overseas demand for this oil seed; drought in some southern districts, and frost in Northern Alberta did some damage, but most of this crop qualified for the top grade of Canada Rapeseed. This brisk overseas market sparked an unusually heavy fall movement of rapeseed; it was estimated that about 75% of the crop had been delivered from farms by mid-November.

Production of domestic mustard seed increased substantially in Southern Alberta in 1960; most of the crop qualified for No. 1 Canada Western, with the Oriental type predominating.

In the Lethbridge area there were about 7,400 acres of safflower seed and over 1,000 acres of pea beans. Both produced high grade crops; the colour of the beans was exceptionally good and the incidence of damage was quite low.

The CHAIRMAN: Any questions?

Mr. MUIR (*Lisgar*): You mentioned safflower seed—is that sunflower seed?

Mr. McCONNELL: No. This is grown in southern Alberta.

Mr. HORNER (*Acadia*): Some of it grows in Saskatchewan.

Mr. MUIR (*Lisgar*): So it is not sunflower seed you are talking about?

Mr. McCONNELL: No, it is safflower.

Mr. FRASER: Safflower was recently introduced in Alberta. It is quite different in appearance to sunflower seed. It is increasing in volume and a crushing plant was established at Lethbridge. Alberta is encouraging the production since they entered the field. We had grades set up of 1-CW and 2-CW but they are not qualifying for these grades.

Mr. DOUCETT: What is it produced for?

Mr. FRASER: Edible oil.

Mr. HORNER (*Acadia*): Is not the oil used for white paint? It does not bleach.

Mr. FRASER: It has a limited industrial use but I do not know what is the nature of the industrial use.

Mr. HORNER (*Acadia*): I was told that safflower seed is a white seed and its oil is white. High grade quality paint is made from it, as it will not turn yellow after years. This is the yarn someone told me.

Mr. FRASER: I could not say yes or no.

Mr. MUIR (*Lisgar*): Have you got anything to do with the inspection of sunflower seed in Manitoba?

Mr. FRASER: There has been practically no inspection of Manitoba sunflower seed in recent years. This is between producer and consumer.

Mr. McCONNELL: Practically all of it is processed in Altona.

Mr. SOUTHAM: There was an amendment to the Railway Act the other day with respect to mustard seed. I was wondering if there is a very large development or growth of mustard seed in western Canada?

Mr. BAXTER: The 1960 acreage of mustard seed was 156,000 acres in western Canada for the total production of 74.7 million pounds.

Mr. McCONNELL: Not very great.

Mr. MACLEOD:

Research Laboratory

The Laboratory provided information on the quality of 1960 western grain and on grain marketed during the 1959-60 crop year for presentation at the October meeting of the Committee on Western Grain Standards and subsequent publication in maps and bulletins. Quarterly bulletins on the quality of cargoes of Red Spring and Amber Durum wheats were continued; with the beginning of the 1960-61 crop year, these two bulletins have been published with text and table headings in French, German and Spanish, as well as English.

Amongst many services provided to the Inspection Branch, assistance in the control of grain drying was of major importance this year; further simplification of test methods and general procedure resulted in improved control under difficult circumstances caused by the high initial moisture content of much of the grain. The Laboratory continued its co-operation with the Canadian Wheat Board, Trade Commissioners, and others involved in merchandising Canadian grain. Studies of new varieties were undertaken as usual in collaboration with the Department of Agriculture. Basic and Applied research projects completed during the year have been reported in 13 papers published or in press in scientific journals. Difficulties are still being experienced in recruiting professional staff to fill vacancies in research sections.

The Director of the Laboratory accompanied the Chief Commissioner on a mission to Japan and Hong Kong, and subsequently visited Australia and New Zealand. Earlier in the year, he attended cereal conferences in Austria, Norway and the Netherlands, and special meetings in Switzerland. Dr. G. N. Irvine represented the Board at the Netherlands Bakery Foundation Exhibition in Amsterdam, and visited Germany and the United Kingdom. Further studies of markets and of grain handling and processing were made during these tours.

Appendix F provides a summarized account of work undertaken by the Laboratory. More complete and detailed information will be published in the Laboratory's Annual Report for 1960.

Mr. THOMAS: Can the witness give us reasons for the difficulties in recruiting professional staff?

Mr. McCONNELL: All I can say, Mr. Thomas, is that we have one of the best laboratories in Canada under the board of grain commissioners. We are proud of it. I think you have all met Dr. Anderson, the chief chemist, and director in charge. I think you will recall that last year Dr. Irvine was here. Dr. Irvine is at present on some special work, for a period, with the wheat board. Here at present we have Dr. Hlynka with us, and I will turn the question over to him.

Dr. I. HLYNKA (*Assistant Chief Chemist, Board of Grain Commissioners for Canada*): I would like to answer that question by saying that perhaps there are two reasons which I can suggest. One is that the supply of graduates has not been large, that is, graduates at the doctorate level for whom we were looking. Secondly, one of the other difficulties is that cereal chemistry as such is not taught and we have to find people who are interested in this field. Most of the graduates are interested more in pure chemistry or industrial research where they consider opportunities are more directly related to their training when they graduate fresh from the university in the spring.

Mr. HORNER (*Acadia*): May we be given some idea, seeing that the research team toured the other countries, as to what wheats are grown mainly; and how, in regard to quality, are we, in regard to wheat produced mainly in the Netherlands and those countries?

Dr. HLYNKA: Among other things, we make a constant check, like all good people, of the products of our competitors. As a result, we have samples of wheat from various countries, which are supplied to us. We still can say with some justifiable pride that Canadian wheat is tops in quality. The only competitors would be some classes of wheat in the United States, and some classes from Argentina. All the other wheats that are grown are mostly the wheats that are of a softer type where the yield is large but the quality is poor. This is true of the Netherlands or the United Kingdom, or France, or Germany, and most of the countries that we know.

Mr. HORNER (*Acadia*): What about Russia? I understand Mr. Conacher toured Russia a year ago. Would the same hold for Russian wheat? I imagine he had a chance to examine it.

Dr. HLYNKA: The Soviet Union has a variety of wheats, but not much of it reaches the market and we are interested only in what reaches the market. It is the only thing we can get our hands on. They have had occasional samples of good wheat, but it is extremely variable and on the whole what we have looked at has not been up to our Canadian wheat in quality.

Mr. SOUTHAM: We have acknowledgements of the fact that Canada has a cereal which is of a very high quality. It has been brought to our attention that Russia is possibly thinking of invading our markets. Have our cereal chemists in the last three or four years been checking these particular samples, to find out any improvement in the average, and to reach an objective in getting a better quality of wheat?

Dr. HLYNKA: We have not been checking wheats for a sufficiently long period from the Soviet Union to be able to answer yes or no to that. We have done so from the more accessible countries. For instance, wheats of French origin have been improving, but they have a long way to go. Wheats of German origin have been coming on. Sweden has been doing good work in plant breeding and development. It is true that most of the people try, but it a matter of economics—they have to choose between yield and quality. We are blessed in the western part of Canada in having a semi-desert condition in which we have no choice. We have to sacrifice yield, but fortunately we are getting quality.

Mr. FORBES: Is that "semi-desert" a new definition for this year?

Dr. HLYNKA: This is correct. This year we have not had the rain for more than 40 days, up to now.

Mr. ROGERS: I would like to know how our standards of Canadian wheats are standing up? Are they better or improving?

Dr. HLYNKA: When I speak of quality, I speak of quality under the skin. Mr. Fraser, our inspector, will speak of quality based on appearance.

Mr. ROGERS: I am interested in quality solely.

Dr. HLYNKA: The answer to that question, then, is this, that the statutory standard that we have in the Canadian Grain Act is the variety Marquis. Our present varieties are substantially better than Marquis—the varieties like Thatcher, for instance—in quality. It is the aim of plant breeders to accept the quality of Marquis as a minimum standard for new varieties that are developed.

Mr. FORBES: Is there any comparison with Selkirk in the new variety, or what is the ratio of quality there to Marquis? Can you give something on that?

Dr. HLYNKA: They are all good qualities. They are like differences in personality between different people you meet. That is about where I would like to leave it. Pembina, of course, being a new wheat, has not appeared in any amount in commercial channels. Selkirk has been grown for a number of years, and it is now the largest variety grown in Manitoba and eastern Saskatchewan.

Mr. PASCOE: On the quality of wheat, would you say, Mr. McConnell, that there is a smaller percentage of wheat growers growing No. 1 now?

Mr. MCCONNELL: Last year it was 1.9 per cent and this year it is 1.4 per cent.

Mr. PASCOE: How does it compare with earlier years?

Mr. MCCONNELL: This is a hardy old perennial too. In my opinion, the quality has not suffered at all, but with the Marquis being the standard with a small uniform tidy kernel and a nice red colour, it was almost perfection. As we progressed and got a higher yield in wheats or just as high, and earlier maturing wheats, I think we lost something to gain these things. To gain some protection against sawfly we introduced Rescue wheat and Chinook wheat.

In Manitoba now it is largely Selkirk and with the introduction of these wheats, I think we lost something in appearance. The reason is, Mr. Pascoe, and we must all agree on this, when we cut the crop with binders and it was stooked, it went through the process of maturing in the stook, some of the stooks with 12 to 14 swathes, in the hot sun; and dew every night contributed a measure to changing the colour a wee bit. These things I am sure are the main reasons why there is no No. 1 Northern wheat today.

Mr. HORNER (*Acadia*): That would not affect the quality.

Mr. MCCONNELL: Not inward.

Mr. HORNER (*Acadia*): I do not "buy" that at all. I did not bring the subject up this year. In 1938, 33 per cent of the Canadian wheat sold for No. 1 wheat. Certainly there were a lot of combines in use in those days. I certainly do not buy that at all. I think we are growing No. 1 and selling as No. 2 today. A lot of farmers would agree with that, I am sure.

Mr. ROGERS: They may be as far as quality, but certainly not in colour.

Mr. HORNER (*Acadia*): Since when does colour determine the grade of wheat? If I know the meaning of the grain act, the colour is not even mentioned in determining between No. 1 and No. 2 wheat. Colour is not mentioned.

Mr. MCCONNELL: The appearance is.

Mr. HORNER (*Acadia*): It is determined on the phrase "practically free" or—

Mr. McCONNELL: —and "reasonably free".

Mr. HORNER (*Acadia*): Yes, "practically free" or "reasonably free". These determine number one and number two wheats, colour is not even in the determination between No. 1 and No. 2 wheat. Colour isn't even mentioned.

Mr. McCONNELL: The appearance is.

Mr. HORNER (*Acadia*): It is determined on the words "practically free" and "reasonably free"; there is a difference between No. 1 and No. 2 wheat depending on those words. I went into it a couple of years ago.

Mr. HENDERSON: The finest wheat we ever grew in the Peace River country was Garnet. It was nice wheat and we could sell it.

Mr. McCONNELL: That was because you had a very small amount of it.

Mr. HENDERSON: We got rid of it all one year.

Mr. McCONNELL: Would you like to speak on the grading, Mr. Fraser?

Mr. FRASER: I would be happy to do so. Our report on the grading of No. 1 Northern for many years included the production of red spring wheat. Garnet wheat is graded by itself and should not be considered in the total. I have the figures. The increase in milling grades is in excess of one half of one per cent of all we report to you in Garnet wheat, and has never been included in this reported wheat. In my opinion it should not be.

In 1959-60 the percentage of all red spring wheat grading No. 1 Northern was 1.4 per cent. The percentage of grades of red spring—not milling grades; I have not included them, because I think it is a much fairer comparison actually—is 1.8 per cent. By milling grades I mean from No. 1 northern to No. 5 wheat. The percentage of coarse red spring up to May 31, 1961, is 2.1 per cent, and in it the milling grades is 2.3 per cent. Now, if I may continue I think the reason for the drop in grading red spring wheat into No 1 grade Northern is largely economic. I am theorizing about this when I say that a good farmer is concerned about prestige as well as income, that is, income through quick harvesting, with less labour in the field, and with consequent dividends to go into his pocketbook. That would be the controlling factor. If he left it in the stook, as Mr. McConnell said, and gave it a chance to ripen properly, this, in particular by some of the recent authorities was discredited, because of two or three days interval in the period of maturity.

Mr. HORNER (*Acadia*): I would like to point out that since 1955 there has been anywhere from close to five per cent, if I remember correctly; and from 1948 to 1955 it varied all the way up to nearly 5 per cent; but not since has it been near to five per cent; and certainly there was not any in 1955 to any great extent.

Mr. FRASER: When I spoke before this committee two years ago, I went out on a limb when I said that we had a significant increase in No. 1 Northern. Then came the rains, and you do not grade No. 1 Northern when it rains.

Mr. HENDERSON: We sold all the wheat there was in the field, and there was not a bushel left in the Peace River in the granary. Moreover the most prosperous farmers in Canada today are those in the Peace River.

Mr. McCONNELL: Most of the grain feeding is done in British Columbia.

Mr. FORBES: I thought all they could raise up in the Cariboo was chicken feed, anyway.

The CHAIRMAN: Let us go on to "weighing of grain".

Mr. HENDERSON: We were five times champion of the world, up in the Peace River.

Mr. MACLEOD:

Weighing of Grain

The staff of the Board's Weighing Branch provided usual weighing services at licensed elevators and investigated complaints relating to reports of excessive outturn shortages on carlot and cargo shipments. The Board's scale inspector carried out periodic tests and inspections of scales at licensed terminal and eastern elevators, and made special inspections when such were considered necessary. Further detailed information in regard to the work of this Branch is given in Appendix E.

Mr. HORNER (*Acadia*): Do you consider that weighing a truck with the front wheels on the scales first, and then the back wheels on the scales, is a proper weigh? Does this give you the same weight that you would get if the scales were long enough so that you could put the whole truck on the scales at once?

Mr. MCCONNELL: Frankly I would not like to express an opinion.

Mr. HORNER (*Acadia*): I do not know where it exists, but I have been told that the two weights come out pretty near the same, when you weigh the front wheels first and then the back wheels. I wondered if there were any tests made, and if it is an official way to weigh grain?

Mr. MCCONNELL: We accept it, but I have not heard of any tests being made. Have you, Mr. Baxter?

Mr. BAXTER: I have not heard of any.

Mr. MCCONNELL: We should try to do this for you this coming year and give you an answer.

The CHAIRMAN: Let us go on to "weighover of stocks, terminal and eastern elevators".

Mr. MACLEOD:

Weighover of Stocks, Terminal and Eastern Elevators

In accordance with the provisions of Sections 139 and 140 of the Canada Grain Act, 25 terminal and 20 eastern elevators were weighed over during the 1959-60 crop year by members of the Board's Weighing and Inspection staffs.

Deferments into the following crop year were made at 11 terminal elevators at the Lakehead, 9 terminal elevators at other points, and at 8 eastern elevators. The Board found it necessary to grant these deferments to avoid delaying the handling and loading of grain required to meet export orders. However, it was possible to carry out eight of these deferred weighovers before the end of December, 1960.

Tables C-12 to C-14 of Appendix C contain the results of weighovers carried out in the 1959-60 crop year.

The CHAIRMAN: Are there any questions?

Mr. MCCONNELL: Is this the section you refer to Mr. Horner, when you mention the time limit on weighovers?

Mr. HORNER (*Acadia*): Yes. I realize that I was dealing with country elevators, and I thought that the same holds true for them; but apparently it does not.

Mr. SOUTHAM: When you say you do not have legislation or authority to insist on the weighover of country elevators, have you received any number of complaints to indicate that we should amend our rules and regulations in that respect?

Mr. McCONNELL: I do not think you could enforce it. If there is no room in the terminal to weigh the grain, and no cars provided for it, you just could not do it.

Mr. PASCOE: You refer to tables C-12 and C-14. Table C-12 talks about excess and deficiencies; it is pretty nearly all deficiencies. Can that be explained? It is on page 34. I do not see many marks in excess.

Mr. McCONNELL: That is after the allowance at the terminal elevator. There is an allowance of one quarter of one per cent, and at eastern terminals it is $\frac{1}{16}$; so you add the allowance before you come up with a figure for the weight. You must assume that there is one quarter of one per cent in the case of the terminals and $\frac{1}{16}$ of one per cent in the case of eastern elevators, that is a shrinkage within the grade.

The CHAIRMAN: Proceed to the next paragraph.

Mr. MacLEOD:

Entomological Investigations

To protect Canadian grain in storage from losses by insects and other grain pests, a regular program of inspection of terminal elevator premises and grain stocks was carried out during 1960. Most of the terminal elevators were visited at least once during the season. The elevators in the Bay Port and the St. Lawrence river area were examined on three occasions. One trip was made to the Pacific coast area. Discussions were held on each visit with the management on the conditions existing and when necessary, instructions were issued on control.

In general, the terminal elevators were reasonably free from insect pests. During the seasons of 1959 and 1960 a stepped-up program on the Pacific coast has resulted in a marked improvement in most of the elevators in that area.

A visit was made to the new Cargill grain elevator at Baie Comeau in July. As it had just been placed in operation a short time previously, it was too early to determine whether the structural features will pose any special insect problems.

The second season of operation of the St. Lawrence seaway still leaves some questions as to the future grain handling patterns. As in 1959 a considerable amount of United States grain is being handled for export through Canadian elevators. Further checking has been carried out of United States grain in store in Canadian elevators to determine its freedom from insect pests. One lot of United States corn was found to be infested and was fumigated at the time of unloading. In another case the elevator declined to take an infested cargo.

Some infestation has been found in Canadian Eastern wheat and one parcel was fumigated.

All of the Canadian government elevators have been very carefully examined during the past three years. Grain is stored for long periods of time particularly in the interior ones. Large representative samples were drawn from the bottom of all bins and examined for insect infestation.

Two short courses for grain elevator personnel are planned for early in 1961 at Montreal, Quebec and Toronto, Ontario. Because of the changing personnel in the terminal elevators there has been a strong demand from the management of the terminals for these courses both for new employees and as a "refresher" for older ones. This educational work by the Board is greatly appreciated by the grain trade.

Close contact has been maintained with the various grain inspection offices of the Board by regular visits through the season to discuss insect control with the staff.

The Board's entomologist, Dr. H. E. Gray, has maintained contact with the grain and milling trade through attendance at the annual convention of the American association of operative millers in St. Louis, Mo., in May.

Close liaison has been maintained throughout the year with the plant protection division of the Department of Agriculture on matters relating to grain storage and grain-infesting insects.

Mr. PASCOE: You mentioned the structural features of the elevator at Baie Comeau. What particular features are they?

Mr. McCONNELL: There are two three-and-a-half-million bushel flat warehouses. What you and I would think of as ordinary rafters are built of big tubular steel. With that, there is difficulty in moving around the large gallery for loading and unloading at the same time. I think it does offer special problems.

Dr. H. E. GRAY (*Entomologist, Board of Grain Commissioners*): The structure is one which is unique so far as Canada is concerned. The walls consist of ordinary concrete and there is a row of five large bins with inter-spaced bins. In addition to that they built the first large steel tanks which hold about three-quarters of a million bushels in one bin of one grade. With any of these innovations we are always a little conscious of whether it will pose problems which we do not have in smaller terminal storage. That is why I raised the question there of whether there would be any problems we had not encountered in the more regular type of storage.

Mr. PASCOE: Is this something brand new all over the world?

Dr. GREY: This same type of storage has been used in the United States in certain areas. Of course, down there their insect problems are much greater than ours. When this was built in the first place we were wondering whether it would make any difference in the type of problem we might have to face here in connection with the terminal storage.

Mr. PASCOE: When the board gives a licence for an elevator do they specify the type of structure?

Mr. McCONNELL: The structure has to be approved by our board.

Mr. MANDZIUK: How long will wheat stay in storage under ideal conditions without deteriorating?

Mr. McCONNELL: As I mentioned, we are carrying grain which is eight or ten years old. The change which takes place is in the aging of the wheat. If it is milled without bromate or other additives it does not hurt it; but if the customer receives a current year's crop which has been shipped in the same hold with eight-year-old wheat, when it is milled he will be dissatisfied in the older wheat.

Dr. HLYNKA: Wheat has been known to keep for quite a good long time under ideal conditions of moisture content and temperature. Probably the most ideal conditions today in Canada would be in the Churchill terminal. As the wheat gets older it requires different treatment for baking; it requires less of certain additives. The thing which people expect from Canadian wheat is to get uniformity, shipment after shipment. They do not like to get inequality of shipment. They like to have the same quality year after year, if they can, or shipment after shipment. Our biggest variation has been, for various reasons, in the Pacific coast. Wheat exported from our eastern terminals is very much more uniform because of the funneling and blending which takes place at the lakehead.

Mr. ROGERS: When you ship, say, six-year-old wheat, is it blended before it is shipped?

Dr. HLYNKA: As it goes through the terminals there is a certain amount of unavoidability of blending; no identity is preserved for any wheat. Sometimes efforts are made to blend a little bit.

Mr. HORNER (*Acadia*): Within different grades.

Dr. HLYNKA: Yes.

Mr. SOUTHAM: When you speak about deterioration in grades, is it deterioration in food quality?

Dr. HLYNKA: No; in the baking quality. When you want to make a sponge cake and use egg whites, if the eggs are cooked or too old they won't beat up in the quality you require. The same thing happens here. It is the ability to make a fine textured loaf.

Mr. MUIR (*Lisgar*): The age does not affect the fertility.

Dr. HLYNKA: Some of the germination will go down. It does deteriorate. I do not like to buy wheat that is ten years old for certain purposes.

Mr. MUIR (*Lisgar*): There is wheat which has been taken out of one of the Egyptian tombs which it is said has the quality to germinate. Does that seem reasonable?

Dr. HLYNKA: It does not seem quite reasonable to me. I will not dispute some of these stories. One of the reasons why people do not like peeled and broken barley is because mould and infestation sets in; and also germination, which is the prime factor in producing malting barley, is reduced; that means a loss in the amount of malt.

Mr. HENDERSON: We had a case in the Peace River area where one fellow sued a grain company for \$20,000. The company held the barley a long time and then it did not germinate; so he sued them. I do not know how he came out.

Mr. ROGERS: Have we any idea how much old wheat we have on hand?

Mr. McCONNELL: Could I beg the courtesy of the meeting to say a few words off the record, because I do not want to give too much publicity to how we are handling the older stored wheat.

The CHAIRMAN: Would this be agreeable to the committee.

Agreed.

The CHAIRMAN: And we hope the press will cooperate and not publish this.

(At this point Mr. McConnell speaks off the record).

Terminal and Eastern Complaints

During 1960, the Board directed the investigation of 44 complaints relating to reports of excessive outturn shortages on shipments to Eastern Canadian points. Included were 35 on vessel shipments from Fort William and Port Arthur, 4 on vessel shipments from Eastern transfer ports, 3 on vessel shipments from other ports, and 2 on truck and carlot shipments.

These complaints were disposed of as follows:

No cause of reported discrepancy found	16
Settlement effected	24
Not yet disposed of	4

TOTAL 44

Mr. THOMAS: Mr. Chairman, I think this may be the place to bring up a question that I have in mind.

The Ontario wheat producers' marketing board have experienced considerable difficulty since they were organized three or four years ago in obtaining the necessary storage space during the Ontario harvesting season. Due to the softer type of wheat grown in Ontario and the higher altitude here than obtains in the west, also the fact that there is more moisture in the climate, and the hotter weather, some of this Ontario wheat needs to be placed where there are drying facilities immediately, and the Ontario wheat producers' marketing board tried to uphold the market by levying 9 cents a bushel on every bushel delivered, and using that as a fund to get this wheat into export channels so that the local market will not become glutted during harvesting time. They have found, over the years, when they tried to get this wheat into the terminal elevators, almost invariably the terminal elevators are filled with western wheat board wheat, being held for shipment. This has posed quite a problem for the Ontario wheat producers' marketing board. I know some work has been done in this connection, but I would like to pose this question: Does Mr. McConnell know whether any definite steps have been taken to remedy this situation?

Mr. McCONNELL: I realize your problem, Mr. Thomas, but it is the wheat board that moves the grain down and uses up the space. That is no concern of ours. But, to offset that, I explained a moment ago that under the terms of the licence we relieve eastern elevators of the obligation to unload western grain—to the extent in the harbour board alone, of 4 million bushels of the total 16 million. So, if they are not willing to save that space to have your grain come in and be treated, we cannot do very much about it. However, we do provide the space to do it, under the terms of the licence. In November, I think we ran up as high as 42 million bushels of space which eastern elevators could do what they liked with, whether it is domestic grain or your milling wheat. They do not have to unload boats and use up that space on western grain, because we relieve them to do so under the licence. We cannot do any more. We cannot tell them how to run their operation.

Mr. THOMAS: Well, Mr. Chairman, might we have just a little clarification of this licensing system which prevents, ordinarily, the eastern elevators from accepting this grain?

Mr. McCONNELL: There is not any prevention in the terms of the licensing to prevent it. Under the terms of the licence we relieve them of the obligation to take any western grain in order that they have space to take in your grain.

Mr. THOMAS: Does this apply over a certain period of the year?

Mr. McCONNELL: It applies in four different months. I have a list here of the exemptions, and I would ask Mr. McLeod to speak on that.

Mr. McLEOD: During the months, Mr. Chairman, from August, September, October and November 1st to 14th, the national harbours board has 4 million exemption; over the balance of that month there is 6 million exemption, and during the winter months there is no exemption. But then, on the opening of navigation, 4 million. Other eastern elevators have similar relief.

Mr. McCONNELL: What one would be closest to you that might help to take in your grain?

Mr. THOMAS: They extend all over the Great Lakes system, from Montreal down to Sarnia, and north to Goderich.

Mr. McLEOD: The Sarnia elevator has 1½ million relief the year round.

Mr. McCONNELL: But they do not have to take in western grain.

Mr. THOMAS: I understand the difficulty, as far as these elevators are concerned, is that they operate on a first come, first serve basis. If a boatload of wheat shows up at a Sarnia elevator, they must accept that wheat; they cannot turn it down if they have space.

Mr. McCONNELL: Not with the space they have except under the terms of their licence.

Mr. THOMAS: During that period.

Mr. McCONNELL: Yes.

Mr. DANFORTH: I have a supplementary question. If I understood the witness correctly, he said under the licence they are exempt, but under the jurisdiction, as owners, they can continue to accept western grain.

Mr. McCONNELL: They can do as they like with that space.

Mr. DANFORTH: In other words, then, as far as we in Ontario are concerned, the board makes that space available, but if it is not available, it is due to the operation of the management themselves.

Mr. McCONNELL: That is right.

Mr. DANFORTH: Now, is it possible for them, under these conditions, to utilize that space for the importation of American grain?

Mr. McCONNELL: Read section 134, please.

Mr. McLEOD:

Subject to this section, the operator of every licensed public or semi-public terminal elevator and, unless otherwise provided by the terms of his licence, the operator of every eastern elevator, shall, without discrimination and in the order in which the same arrives at such elevator and is offered, receive into such elevator all grain of any grade for which there is available storage of the kind required by the person by whom such grain is offered.

They must accept the grain, sir, if it is offered, if there is storage for it and in a storable condition.

Mr. DANFORTH: That seems to be a contrary statement to the one before. You said they are exempted from that, and then in this case they must accept it, if it is made available.

Mr. McLEOD: Unless otherwise provided by the terms in his licence.

Mr. DANFORTH: He must at all times accept it? Under the terms of this licence he is exempted to the extent—

Mr. McCONNELL: —of that space.

Mr. DANFORTH: And he has complete jurisdiction over that.

Mr. McCONNELL: Yes.

Mr. THOMAS: I understand the board of grain commissioners operate the government terminals in the west?

Mr. McCONNELL: Yes.

Mr. THOMAS: Are any of these eastern terminals operated by the board?

Mr. McCONNELL: No. There are just six government elevators, sir: Prince Rupert, Edmonton, Calgary, Moose Jaw, Saskatoon and Lethbridge.

Mr. THOMAS: You said that the board of grain commissioners have no jurisdiction over the elevators on the St. Lawrence and the Great Lakes, except that you do control the regulations concerning them?

Mr. McCONNELL: For inspection and weighing, yes.

Mr. THOMAS: So you have done all that you can do—

Mr. McCONNELL: Yes.

Mr. THOMAS: —to make this storage space available?

Mr. McCONNELL: To provide the space for you people. That is the way we interpret the act—to provide this space when you people are harvesting your grain, and this is how we implement it.

Mr. MANDZIUK: While we are on that point, may I ask if Ontario wheat is exported?

Mr. McCONNELL: A small amount is. It is mostly for domestic and the pastry industry. But, there is some exported.

Mr. DANFORTH: When available.

The CHAIRMAN: We will proceed to the next paragraph.

Complaints on export shipments

A total of 65 complaints relating to shipments to overseas destinations were dealt with by the board and its officials during 1960. Of this number, 25 concerned outturn weights reported from overseas, and 40 referred to some aspect of the quality of grain cargoes.

Disposition was as follows:

	Quality	Weight
No cause of reported discrepancy found	—	21
No grounds for complaint	39	—
Settlement effected	—	1
Complaint withdrawn	—	1
Not yet disposed of	1	2
	—	—
TOTALS	40	25

Mr. McCONNELL: I should like to add, we had a few more overseas complaints last year, mainly because of the harvest of the 1959-60 crop. We dried 73 million bushels but a lot of the grain was off colour. There were some shrunken kernels in it, and as a result we had a few complaints about it. They did not like the look of it. It is the same as happens when you go into a store. If you pick up an article and do not like its appearance you will not buy it.

Mr. ROGERS: Tell Mr. Horner that.

Mr. HORNER (*Acadia*): On this point, was there a complaint with regard to the cleanliness of the ships in which the grain was loaded on the west coast?

Mr. McCONNELL: In one case it was a tanker and also I think it took too long to load, but that was the only complaint we had of that nature.

Mr. HORNER (*Acadia*): Is it the duty of the board of grain commissioners to inspect the ships?

Mr. MACLEOD: Our man goes on board the ships, but it is the duty of the port warden to ensure a ship is clean and ready to receive grain.

Mr. FORBES: To whom does he report?

Mr. MACLEOD: To the Department of Transport. This is an operation under the Canada Shipping Act.

Mr. HORNER (*Acadia*): On the question of loading—

Mr. McCONNELL: Evacuators?

Mr. HORNER (*Acadia*): Yes. Do they come under this paragraph? Were they purchased by Canadian or Norwegian shipping vessels?

Mr. McCONNELL: You can understand the tankers are pretty cheap storage, and naturally I think the charter is a cheaper rate than the ordinary grain boat. You will also realize that on tankers there are only about two or four places, about two feet across, through which they load the oil, and so they have to use another type of loading machinery, which is automatic suction equipment. I imagine it was the Norwegian people, or the Chinese sources to which the grain was going that had to have these evacuators.

Whether it was the owners of the ships, because the charter was at a cheaper rate, I could not tell you, but they cost \$120,000.

Mr. FORBES: Each?

Mr. McCONNELL: No, the total. It cost \$120,000 for ten of them.

Mr. HORNER (*Acadia*): Are these similar to vacuum pumps which some of the elevator companies and annexes use in western Canada?

The CHAIRMAN: We shall go on to the next paragraph.

Mr. MACLEOD:

Statistics

Statistics relating to Canadian grain movement collected and compiled by the board's statistics branch are presented in appendix C of this report.

Information Program

The board's mobile exhibit was placed on display at 12 agricultural fairs in Manitoba and Saskatchewan during 1960. The exhibit featured samples of various types and qualities of grain, with special emphasis on malting barley, and included a working model of an automatic sampler, a device used at terminal elevators to take samples from a moving stream of grain. Two of the board's grain inspectors were in charge of the exhibit and discussed grain grading and other matters coming under the board's jurisdiction, with farmers, elevator agents and superintendents and other interested visitors. A special exhibit was prepared for display at a seed show at Moose Jaw during the month of October.

The board's offices were visited by a number of officials of the foreign trade service of the Department of Trade and Commerce, and by other individuals and groups from overseas who wished to discuss matters related to the grain trade and obtain first-hand information about the functions and services of the board. Other visitors during the year included groups of country elevator agents and agriculture students.

In addition to discussions with members and officials of the board, arrangements were made for visitors to tour the inspection branch, the research laboratory and other branches as desired; also to view the colour motion picture film "Grain Handling in Canada".

Members of the board and senior officials again accepted a number of invitations to address annual meetings of producer organizations and to discuss topics of current interest related to the board's work.

Mr. MUIR (*Lisgar*): Was that exhibit shown at all classes of fairs?

Mr. McCONNELL: No, there is only a limited number of fairs at which it is shown. It is already on the road now. I think it is B class fairs, some years in Saskatchewan, some years in Alberta, and this year partly in Manitoba but mostly in Saskatchewan.

Mr. MUIR (*Lisgar*): You would not know which fairs in Manitoba?

Mr. McCONNELL: If we have not got a list we shall send it to you.

Mr. ROGERS: What about Alberta?

Mr. McCONNELL: I think Alberta had it the year before last.

Mr. GRAY: It will go to some places there this year.

Mr. PASCOE: Is that film available to show publicly?

Mr. McCONNELL: We intended to bring it here, but whatever happened it did not arrive. We shall have it here sometime to show to you.

Mr. FORBES: We might be gone.

The CHAIRMAN: We shall go on to the next paragraph.

Mr. MacLEOD:

Canadian Government Elevators

Receipts of grain during the crop year 1959-60 at the Canadian Government Terminal Elevators operated by the Board at Moose Jaw, Saskatoon, Calgary, Edmonton, Lethbridge and Prince Rupert, were 17.4 million bushels, compared with 18.9 millions in the previous crop year. Total shipments were 18.1 millions, an increase of 1.4 millions from the corresponding figure for 1958-59.

In the fiscal year 1959-60, revenues exceeded expenditures by the amount of \$403,979.

Mr. PASCOE: Shall we deal with appendix G now in relation to the elevators?

Mr. MANDZIUK: Does that mean there was just one turnover in these government terminal elevators?

Mr. McCONNELL: We only get grain when the wheat board uses our elevators, and to encourage them we reduced our charges from 2 $\frac{3}{4}$ cents to 1 $\frac{1}{4}$ cents. We operate on 1/45, and in government elevators there is stop-over charge of 3 cents a hundred, and there is an additional charge to the wheat board when they want to remove the grain. As a rule, this is an inducement for the wheat board to use our elevators. If we charged interest and depreciation as a company operating these elevators we could not do this. We pay grants in lieu of taxes but, in the overall operation of the six elevators, Lethbridge has not paid for years because there is no turnover there, so that Moose Jaw, Saskatoon and Prince Rupert have carried the load.

Mr. PASCOE: Appendix G is on page 64. Shall we carry it now or later?

The CHAIRMAN: I think we shall take the appendix later. We shall go on to the next paragraph.

Mr. MacLEOD:

Lake Freight Rates

On March 10, 1959, under the provisions of section 5 of the Inland Water Freight Rates Act, the board issued Order No. 21 which revoked Order No. 20 of September 28, 1954. This had the effect of cancelling maximum freight rates established by the board in Order No. 20 for the carriage of grain from Fort William or Port Arthur to other specified ports in eastern Canada.

The average rates charged during the 1960 season of navigation are given in table C-11 of appendix C.

Mr. HORNER (*Acadia*): You are talking here about their being revoked.

Mr. McCONNELL: Under the Inland Water Freight Rates Act it is the responsibility of the board of grain commissioners to set the maximum rates, but with the opening of the seaway, when the maximum rate was 16 cents to Montreal from the Lakehead, we hoped that competition with the seaway would bring about a lower rate, which it did. Last year I would say, Mr. Baxter, that most of the grain moved at 13 cents, with the odd cargo at 14 cents. It has the desired effect but we still have the authority to set a maximum rate, should they start to put up their rates.

Mr. HORNER (*Acadia*): This was on the lakes. I am thinking of the 5 $\frac{3}{4}$ and $\frac{3}{8}$ cents supposed to be saved by the seaway. You would have to include most of the grain diverted from the railroads to the seaway in order to make that 5 $\frac{3}{8}$.

Mr. McCONNELL: That would be a question for the wheat board. They estimated there would be a 5 $\frac{3}{4}$ saving at five or six designated points. The grain was moved by lakers but still they had to transfer to canallers because of the depth of the water from there down to Montreal.

So there was a transfer charge. Now they have a total charge to pay instead of the transfer, so operating at the 13 cents instead of 16 cents they should still have a saving. The laker boats are getting larger all the time, so even at a lesser rate if they can get a fairly quick turn-around or unload they are still making good money at the 13 cents freight rate. I would not say the western farmer will not pick up 5 $\frac{3}{8}$ cents because, remember, there is only half the wheat export from Canada which goes out the Atlantic side; the other half goes from the Pacific, and 20 million goes out of Churchill, so the saving is on the portion at this end. It might mean a cent and a half to the farmer.

Mr. HORNER (*Acadia*): But it has not meant five cents.

You talk here about a cancelling; was this an increase or lowering in the rates or were these rates that were cancelled because of the seaway?

Mr. McCONNELL: We cancelled the maximum rate of 16 cents, and competition determined it would be 13.

Mr. MACLEOD:

Prairie Farm Assistance Act

Under provisions of Section 11 of the Prairie Farm Assistance Act the Board continued to collect the one per cent levy on grain purchased by licensees under the Canada Grain Act. During the crop year 1959-1960 the amount collected was \$6,326,924.00, a decrease of \$347,074.00 from collections recorded for the previous crop year. Collections by the Board since the inception of the Act to July 31, 1960, total \$120,312,114.00.

Mr. HORNER (*Acadia*): Would you have any ideas as to how much was collected because of the rate from rapeseed?

Mr. McCONNELL: The first one was \$37,000.

Mr. HORNER (*Acadia*): Would that be for the full year?

Mr. McCONNELL: The first year that rapeseed was recognized as grain.

Mr. SOUTHAM: Was there much of a reduction in the amount collected because of the Manitoba crop insurance plan?

Mr. McCONNELL: Mr. Baxter will answer your question because it has a bearing on the amount we will be showing.

Mr. BAXTER: In answer to that question, from August 1, 1960, which was the initiation of the Manitoba crop insurance scheme, to April 30, our figures show approximately \$46,000, which represents the levy which would have been collected, but was otherwise exempted by that provision in the province of Manitoba.

Mr. MACLEOD:

Organization and Personnel

Two of the Board's Assistant Commissioners retired during 1960—Mr. M. M. MacKinnon, after serving in Alberta since 1947; and Mr. J. I. Hetland, after five years' service in Saskatchewan.

Mr. A. Rendfleisch and Mr. C. J. Hunt were appointed to fill the resulting vacancies, with offices at Edmonton and Regina respectively.

There were several changes in senior personnel of the Inspection Branch. Mr. C. E. S. Robertson, Grain Inspector-in-charge at Vancouver since 1949, retired after forty years of service with the Board. Mr. H. McArthur was promoted to succeed Mr. Robertson.

Mr. J. H. McLean was transferred from Calgary to Vancouver and was succeeded as Inspector-in-charge at Calgary by Mr. A. J. Goddard.

After a total of forty-eight years of service, including eleven years as Inspector-in-charge at Montreal, Mr. P. J. Smith retired and his place was taken by Mr. M. M. Ainslie, formerly on the staff of the Fort William Inspection Office.

As a further step in a program of re-organization, the Registration Branch became a division of the Statistics Branch.

At December 31, 1960, the Board's staff totalled 910 as compared with 912 at the end of the previous year. The staff of the Canadian Government Elevators numbered 203, indicating a reduction of 31 during the year.

A chart of the Board's organization, including further details of staff location, follows this report.

I might mention Mr. C. J. Hunt passed away recently.

The CHAIRMAN: Any questions on this section?

Expenditure and Revenue

Total expenditure and accrued revenue of the Board, exclusive of the Canadian Government Elevators, for the fiscal year 1959-60 compared with 1958-59 was as follows:

	1959-60	1958-59
Expenditure	\$4,402,576.57	\$4,471,770.15
Revenue	2,604,923.85	2,793,669.51

Expenditure for the nine months of the 1960-61 fiscal year to December 31, 1960, totalled \$3,151,475 as against \$2,992,012 for the comparable period during 1959-60.

Cash revenue for the same nine-month period amounted to \$1,947,624 as compared with \$1,999,170 in the previous year.

Mr. FORBES: Can you tell us a little about sources of revenue?

Mr. McCONNELL: Yes. On page 71 you will see them mentioned. We have not got too many sources of revenue. As businessmen we would all like to be in the black figure, but that just is not possible. It has always been accepted that the board of grain commissioners provides a service such that it is possibly not too important that the figures should balance. On page 71 you will notice that most of our revenue comes from inspection at the rate of \$2 per car for inspection, and the next item shows there is an amount of \$1 per car from weighing. Those are the two largest sources of our income. There are small amounts there, overtime refunded and express charges. In regard to samples sold, once or twice a year I think the inspection branch at various places call for tenders and sell the grain that is in samples. It is contaminated with mothballs and so on.

Mr. PASCOE: How much would that be, containing mothballs?

Mr. FRASER: In Winnipeg, 60,000 two-pound samples.

Mr. PASCOE: Who would by that?

Mr. McCONNELL: It is used for hog fattening—and you buy some of that to feed turkeys, back at Dauphin.

Mr. PASCOE: I was wondering what was wrong with it.

Mr. McCONNELL: You will note that the other departments of the board of grain commissioners do not provide a great deal of the revenue—appeal tribunals, \$4,000; registration, \$46,000; statistics \$29,000. Our research laboratory cost quite a bit, but there is no revenue. So if you look at the two figures we are “in the hole” about \$2 million.

There would be only one alternative, to try and build up a fund. I think we brought this up to the committee every year. That would mean raising the weighing and inspection fees. If you did that, if you raised inspection by \$1 and the weighing by 50 cents, it would give you roughly \$1,237,000. But this is the way we have always looked at it, and I have explained it here before. At the present time it is governmental policy that the western farmer, and the eastern farmer to some extent also, requires subsidies. The western farmer presently is being helped to the extent of about \$49 million in storage earnings and \$42 million in acreage bonuses. What would be the sense of our raising the fees on grain if you give with one hand and take away with the other hand? Therefore, we have no recommendation, sir. We would like to have balanced figures, but we have not got them for that reason.

There is another thing. Regardless of the size of the crop grown and produced, that is not indicative of the revenue the board can earn. It is the amount of grain that moves through the licensed channels that determines the amount of our revenue.

Mr. ROGERS: It should look a little better this year.

Mr. McCONNELL: Sure, the more volume the more revenue.

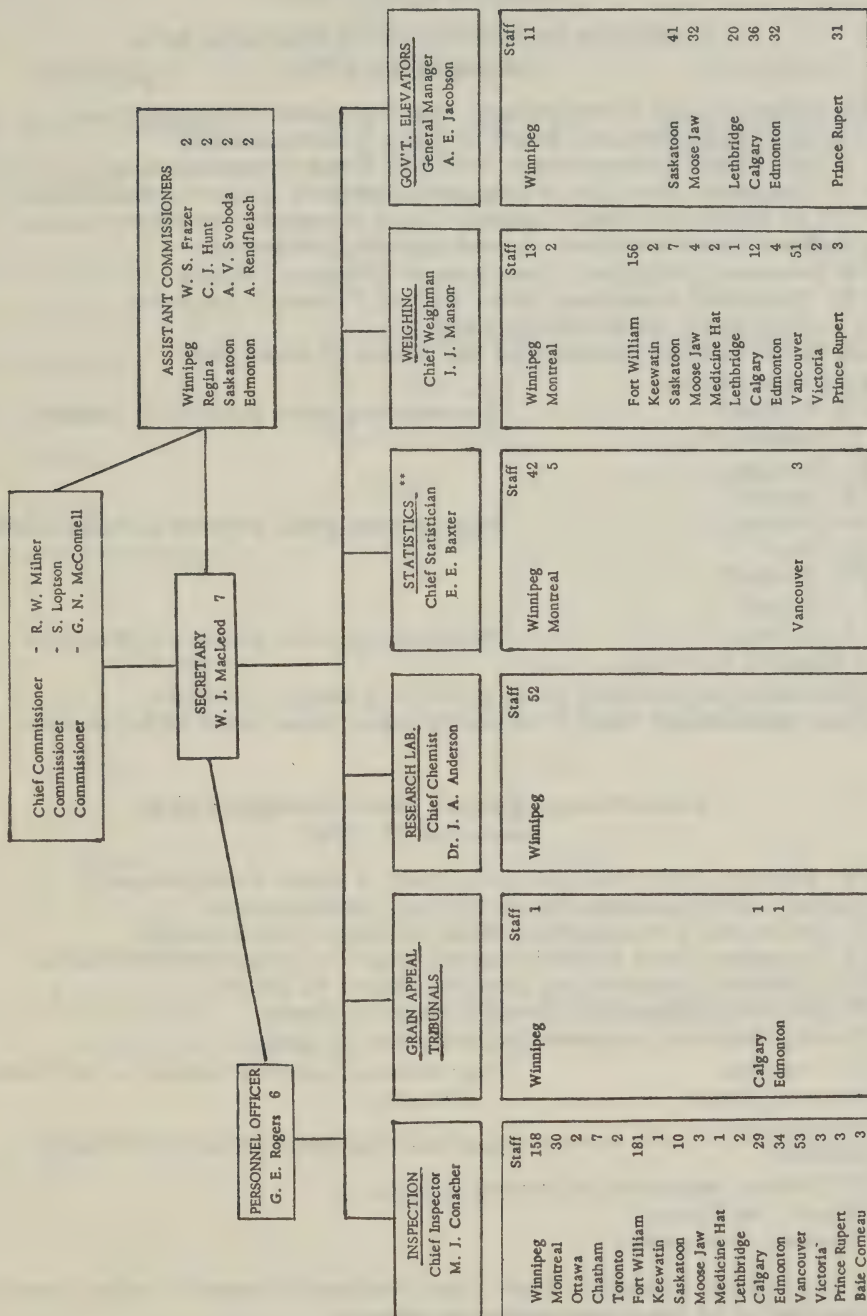

Mr. HORNER* (*Acadia*): If you included the “other revenue” in your expenses, would it not improve that also?

Mr. McCONNELL: Yes. I did not make a point of that, because I know that wages were required to be increased in the last five years. Our salaries bill has gone up in a steep increase by \$1,700,000, over which we have no control at all. If you take that out of it, we would not be far off it.

Mr. ROGERS: Mr. Chairman, I think they are doing a very good job.

The CHAIRMAN: We now turn to Appendix A, page 19.

BOARD OF GRAIN COMMISSIONERS
FOR CANADA

** INCLUDES LICENSING AND REGISTRATION OFFICES.

APPENDIX A

Committee on Western Grain Standards as at December 31, 1960

- R. W. Milner, Chief Commissioner, Board of Grain Commissioners.
- S. Loptson, Commissioner, Board of Grain Commissioners.
- G. N. McConnell, Commissioner, Board of Grain Commissioners.
- M. J. Conacher, Chief Grain Inspector, Board of Grain Commissioners.
- Dr. J. A. Anderson, Chief Chemist, Grain Research Laboratory.
- D. E. Ross, Chairman, Grain Appeal Tribunal, Winnipeg.
- R. E. Forrester, Chairman, Grain Appeal Tribunal, Calgary.
- A. M. Creighton, Chairman, Grain Appeal Tribunal, Edmonton.
- Dr. A. E. Hannah, Dominion Cerealists.
- L. A. McCorquodale, representing the millers of wheat flour.
- George Bennett }
- W. H. Fairfield } Representing grain growers in Alberta.
- B. S. Plumer }
- J. H. Harrison }
- A. P. Gleave }
- J. Wellbelove } Representing grain growers in Saskatchewan.
- L. L. Gray }
- N. W. Strelloff }
- W. J. Parker }
- P. A. McPhail } Representing grain growers in Manitoba.
- Ray Mitchell }
- G. Constable, representing grain growers in British Columbia.
- L. Bell, representing Plant Products Division, Department of Agriculture.

Committee on Eastern Grain Standards as at December 31, 1960

- R. W. Milner, Chief Commissioner, Board of Grain Commissioners.
- S. Loptson, Commissioner, Board of Grain Commissioners.
- G. N. McConnell, Commissioner, Board of Grain Commissioners.
- M. J. Conacher, Chief Grain Inspector, Board of Grain Commissioners.
- W. G. Thomson, representing Montreal Board of Trade.
- E. D. Sullivan, representing Toronto Board of Trade.
- C. Gordon McAuley, representing exporters of grain.
- F. H. Dunsford }
- H. Norman Davis } Representing millers of wheat in the Eastern Division.
- J. R. Heaney }
- A. McLean } Representing grain growers in Ontario.
- G. C. Nichols, representing growers of corn.
- P. Blouin, Additional.
- A. Bowman, Additional.

Mr. HORNER (*Acadia*): Have there been any changes? I notice there is a representative of the grain growers in Alberta.

Mr. MACLEOD: We had a death in Alberta. It was Dr. Fairfield; and oh yes, Erie Powell of the Peace River indicated that he would like to be retired.

APPENDIX C

Statistics Branch

E. E. BAXTER, *Chief Statistician*

(A) STATISTICS

The Statistics Branch receives reports from all elevators licensed under the Canada Grain Act and from these returns compiles and publishes basic statistics relating to the storage and handling of grain within the Canadian elevator system. It prepares audit statements of the operations of all terminal and eastern elevators, verifies the insurance carried on grain stocks and handles the record details relating to the amounts collected as the 1% levy under the Prairie Farm Assistance Act. It supplies for review by the Board a detailed analysis of all grain handlings and co-operates with other Board offices in the maintenance of detailed records of principal operations.

(B) LICENSING

The Canada Grain Act provides that no railway company or vessel shall receive any western grain from any elevator or discharge any such grain into any elevator unless such elevator is licensed by the Board. The Act also specifies the conditions by which grain dealers, track buyers or grain commission merchants must be licensed in order to engage in contracts dealing with western grain by grade name. Such elevator and dealers' licences are issued by the Board through the licensing division of the Statistics Branch. This office also supervises the implementation of Section 79-3 by which all such licensees must be secured by bond or otherwise for the performance of all obligations imposed upon them by the Act.

(C) REGISTRATION

Section 127 of the Canada Grain Act requires the operators or managers of public terminal, semi-public terminal and eastern elevators to issue warehouse receipts or transfer receipts for all grain taken into store. Regulations No. 1 and No. 2, made by the Board under the provisions of Section 15 (22) of the Canada Grain Act, require that all such warehouse receipts or transfer receipts be registered with the Board as to grade and quantity at the time of issue, and that these warehouse receipts or transfer receipts be surrendered to the Board for registration for cancellation when the grain which they represent has been shipped out.

Introductory Comment

The office consolidation program initiated during the previous year was further developed during the 1959-60 season. Preliminary arrangements were completed towards the inclusion of Registration Branch operations effective August 1, 1960. The adaption of registration records to machine accounting techniques presents special opportunities for greater integration of office operations both within the Board and between the Board, the grain companies and the Canadian Wheat Board. This latter development will be progressive over future years but could not be initiated until this step was effected. New techniques were developed and applied to the licence issue and records, further facilitating the work of both this office and the grain companies. Included were new procedures whereby the principal public record, "Grain Elevators in Canada" was available for release shortly after the opening of

the new crop year, a publishing schedule not possible under former methods, but of considerable value to grain and transportation companies.

The introduction of a provincial crop insurance scheme in Manitoba effective with the 1960 crop necessitated certain adjustments in the records and reports covering the collection by licensees of the 1% Prairie Farm Assistance Act levy. This office worked in close co-operation with the Provincial authorities and grain company representatives towards an interim procedure for the 1960-61 season. Further discussions are scheduled regarding the development of a working system to apply as the Crop Insurance Programs are extended.

(A) Statistics

The growing use of grain statistics in the daily operation of grain companies, transportation firms and government agencies continued to be reflected in an increasing demand for both regular bulletins and special studies. The flexibility of our statistical records achieved through electronic data processing greatly facilitated the work. Of special note were the additional and earlier bulletins on the licensing position. Special studies on the terminal handlings of particular grades were of significant value to the Inspection Branch in its development of new procedures. Other studies related to terminal operations and lake shipping were carried out for the use of the Weighing Branch. The office continued to perform service operations through its machine installation for the Research Laboratory, the Personnel Division and the Accounts Branch. Close liaison was maintained with related departments of the Canadian Wheat Board and all statistical records were available for their use to avoid duplication of statistical work between the two organizations.

The office continued its collaboration with the Agriculture Division of the Dominion Bureau of Statistics in the supply of grain statistics for its related publications. Historical records were also made available to the Royal Commission on Transportation. Co-operative exchange of statistics was maintained with corresponding units of the United States Department of Agriculture, the Food and Agriculture Organization in Rome and the Commonwealth Economic Committee in London.

The responsibility of the office under provisions of the Inland Water Freight Rates Act was again of particular significance as vessel charter confirmations covering all lake grain cargoes shipped from Fort William-Port Arthur were examined and data tabulated to keep the Board advised on lake shipping charges. Charter confirmations were recorded covering 902 separate inland cargoes moving between the Canadian Lakehead and Eastern Canadian ports in vessels of Canadian and Commonwealth registry between the period April 10 to December 13.

A special review involving the refinement of policy wordings was made with respect to country elevator fire policies on grain stocks. The responsibility of the Branch under Section 102 of the Canada Grain Act was carefully discharged both in the above and in the regular examination of insurance reports and documents related to insurance coverage in country, terminal and eastern licensed storage positions.

Audit examination was conducted in connection with the weighover of 2,101 country elevators, 21 semi-public terminal elevators, 4 private terminal and 20 eastern elevators. Special statistical studies were prepared to supplement the regular audits and to further facilitate Board analysis of the accounting statements. Details of the accounting statements prepared in accordance with Sections 139 and 140 of the Canada Grain Act are summarized in Tables C-12 to C-14 inclusive, of this Appendix.

The collection of the 1% levy made under provisions of Section 11 of the Prairie Farm Assistance Act and under authority delegated to this office involved 1959-60 returns totalling \$6,326,924.00, a reduction of \$347,074.00 from levy remittances during 1958-59. The decline reflected the lighter marketing volume and a different grain and grade composition.

(B) Licensing

During the initial licensing period of the crop year 1959-60 from August 1 to December 1, 1959, 5,469 licences were issued to 97 firms and individuals. Included in these were 47 licences granted to Track Buyers, Commission Merchants and Grain Dealers. In addition, country elevator licensees were authorized to use 169 off-site grain storage buildings of various types.

In the course of the crop year twenty-one licences were cancelled, by reason that two elevators were destroyed by fire; sixteen were wrecked or dismantled; two were converted to annexes, and one application was withdrawn. Fifty-seven authorizations for grain storage buildings involving 4.2 million bushels of space were also cancelled during the crop year as the stored grain was moved to terminal positions.

Nineteen country elevator licences were suspended during renovation and reconstruction of buildings. Sixteen of these were reinstated; one was cancelled, and two, still under suspension at the end of the crop year, were not submitted for renewal at the beginning of August, 1960.

Guarantee bonds in the amount of \$30,641,275.00 executed by 13 approved surety companies were deposited with the Board as security under Section 79 of the Canada Grain Act to cover operations of licensees during 1959-60. No negotiable Government bonds were deposited in lieu of the usual form of surety bond.

As at July 31, 1960, with 5,413 elevator licences and 147 grain storage building authorities in force, the licensed storage capacity was 631,884,110 bushels in elevators and 7,170,500 bushels in grain storage buildings, a decrease in the total licensed storage capacity of 2,891,640 bushels since July 31, 1959. The total licensed storage capacities by provinces are: Manitoba, 59.1; Saskatchewan, 208.3; Alberta, 137.2; British Columbia, 28.0; Ontario, 154.1; Quebec, 45.2, and the Maritimes, 7.2 million bushels.

The major changes in the composition of this storage were reductions of 16.1 million bushels in country elevator storage and 4.2 millions in grain storage building capacity, and the increase of 17.4 millions in terminal and eastern elevator facilities including the construction of a complete new elevator at Baie Comeau.

(C) Registration

Due, primarily, to the very large quantities of damp and tough grain that were received by semi-public terminal elevators to allow for artificial drying of the grain to prevent spoilage, the offices in the Western Division experienced one of the most difficult operational years in the history of the Branch. The total number of warehouse receipts submitted for registration was considerably in excess of that of other years, particularly in the case of the Lakehead group of elevators, as a separate warehouse receipt was required to be registered for each carlot of damp or tough grain received.

Calculation of the drying shrinkage was also required to be made for each carlot as it was dried and a new warehouse receipt registered for the dried weight. The total number of warehouse receipts handled through these offices exceeded that of 1951-52, the previous record crop year but, due to experience gained in that year, plus improved operational procedures, service was maintained at proper levels without increase in staff.

Records were kept for each licensee in both the Eastern and Western Divisions, by grade, showing the total quantities registered, cancelled and outstanding each day with a breakdown of this data to provide total receipts, shipments, natural and artificial drying and grade adjustments for the crop year. A separate series of records also maintained for each licensee provided a complete registration and cancellation record of all warehouse receipts or transfer receipts that were issued. Grade adjustments, as reported daily by the licensees of semi-public terminal elevators, were carefully scrutinized to see that they conformed to the non-mixing provisions of the Canada Grain Act. Certified statements of outstanding warehouse receipt and transfer receipt grade totals together with the total handlings of the non-mixing grades of wheat and other relevant information, were supplied as required for use in summarizing the results of the annual weighover of stocks of grain as carried out by Board officials at terminal and Eastern elevators.

Registration service was also provided to licensees of elevators in the Western Division for warehouse receipts that were required to be split, consolidated, re-issued or adjusted for grade to facilitate documentation in connection with the handling of the grain.

While the total number of warehouse receipts submitted for registration during the year increased materially, the total handlings of primary receipts and shipments at these elevators, for the crop year 1959-60, shows a decline when compared to the ten-year average at all points except Vancouver.

Fees for registration service were charged at the rate of 4 cents a thousand bushels for registration and for registration for cancellation in the Western Division, and one cent a thousand bushels for registration and for registration for cancellation in the Eastern Division. The overall decrease in handlings of primary receipts and shipments is reflected in the total fees collected for the period under review of \$44,942.56 as compared to the ten-year average of \$49,533.05.

General

Summary grain statistics with respect to the 1959-60 crop year and the 1960 season of navigation are presented in table form following this section. Complete details are published in the various regular and periodical bulletins of the Branch, in the Branch's export release, "Canadian Grain Exports 1959-60", and in the "Grain Trade of Canada" issued jointly by this office and the Agriculture Division of the Dominion Bureau of Statistics. Details of licences issued under the Canada Grain Act are carried in the publication "Grain Elevators in Canada". Table C-19 of this Appendix presents the total bushels, by grains, for which warehouse receipts or transfer receipts were registered and/or registered for cancellation at offices of the Board maintained for this purpose at Montreal, Winnipeg and Vancouver.

APPENDIX D

Inspection Branch

M. J. CONACHER, *Chief Grain Inspector*

Under Section 32 of the Canada Grain Act, the Grain Inspection Branch in the Western Division establishes grades on carlots of grain on samples drawn during unloading by officials of the Inspection Branch at the Lakehead, Pacific Coast, Churchill, Winnipeg, Calgary, Edmonton, Moose Jaw, Saskatoon, Lethbridge and Medicine Hat. Also, all grain shipped from terminal and mill elevators is officially sampled and inspected. At the primary inspection points of Winnipeg, Calgary and Edmonton, samples placed in railway cars by country elevator agents are removed and graded; while this service does not provide official grades of these shipments, the grades established on the unofficial samples are used by the shippers and terminal operators as a guide to their delivery and handling of the grain.

In the Eastern Division, sampling and grading service is provided on request at Chatham and Toronto for eastern grown grain. At Montreal, Quebec, Sorel, Three Rivers, Baie Comeau, St. John and Halifax, grain loaded into vessels for export is sampled and reviewed with respect to grade.

Grades of all grain in store in all terminal and eastern elevators weighed over during the crop year are verified by officials of the Inspection Branch.

Crop Conditions and Grades, 1959, Western Division

Western Canada had great extremes in weather in 1959. In the spring, soil moisture varied from extremely low in the central and southern parts of the Prairies, to adequate in the northern and western areas, and excessive in eastern Manitoba. The dry area continued dry and hot through summer, so much of the crop was light. Outside of the dry belt, to the west, north and east, many crops were damaged by frosts and by rain at harvest time; large areas of crops were left in the fields under snow, to be threshed after freeze-up or in the spring.

The proportion of high grades of grain shipped was remarkable, considering the bad weather that the crops endured; although there is no doubt that much of the lower grade grain was used on the farms as feed, including grain that was possibly damaged in drying on the farms. The farmers generally were obviously impressed by publicity given to the risk of loss of precious markets if grain that was damaged in drying should be sold to overseas millers or maltsters, represented as Canadian "quality" grain.

Manitoba No. 3 Northern was the predominating grade (31.7%) of red spring wheat shipments through the 1959-60 crop year. Shipments of Manitoba No. 2 Northern were down from the previous year (27.9% against 33.5%), as was Manitoba No. 1 Northern (1.4% against 1.9% in the 1958-59 crop year); but only 16.0% of shipments graded Manitoba No. 4 Northern, No. 5 and No. 6. The figures given here do not include Tough and Damp red spring wheat (20.3% of all carlot shipments), practically all of which was promoted to straight grade after drying in terminal elevators.

In considering the percentages of different grades shipped, it must be remembered that these contain varying proportions of grain carried over from the previous crop year. Farmers are naturally disposed to sell their higher grade, thus higher priced, grain and use the lower priced grain for feed; how-

ever, it is significant that the supply of low grade wheat virtually disappeared through the summer of 1960.

The pattern of grades of durum wheat shipped in the 1959-60 crop year was even better than that of red spring wheat. Less than 12 percent of shipments were graded No. 4, No. 5 and No. 6 Canada Western Amber Durum. This could be attributed to the fact that little durum wheat is grown in the northern areas where the weather was so bad in the fall of 1959. The same applied to rye, which was generally of high grade; 65.2% of shipments of this grain were graded No. 1 or No. 2 Canada Western.

Only 14.7% of oats shipped during the crop year were "straight" grade (dry) No. 3 Canada Western and higher. Damage from mildew, the result of weathering, was more conspicuous in oats than for several years.

41.3% of the barley shipped in cars from the country were graded No. 3 Canada Western or higher (including six-row and two-row), but much of this was not accepted by domestic maltsters or exporters to the malting trade, on account of thin, ripe kernels from the dry areas, and because mechanical handling increased the percentages of peeled kernels—the cause was loose hulls from weathering of the ripe crops in the wetter areas. Much of this barley was subsequently demoted to "feed" grades in the terminal elevators because it could not be delivered in conformity with requirements of the malting trade.

Flaxseed showed the effect of weathering in the fall. Only 66.8% was graded No. 1 Canada Western, compared to 89.0% in the 1958-59 crop year. Much of the rapeseed shipped was high in moisture content, and was dried in terminal elevators. Both rapeseed and flaxseed that was caught in the fields under snow meant substantial losses to the growers; they took serious losses in grade, and in many cases these grains were not worth threshing in the spring.

Mustard seed produced in the Lethbridge district, was about 90% No. 1 Canada Western, with Oriental variety predominating.

Crop Conditions and Grades, 1959, Eastern Division

In Eastern Canada, the winter of 1958-59 was particularly hard on crops of winter varieties of wheat and barley. Winter-killing of these grains was so severe in southwestern Ontario that much of the acreage was resown in the spring. The losses of winter barley were offset by planting of spring barley, but wheat production was sharply reduced.

The summer of 1959 was abnormally dry in Ontario and Quebec, so the early-maturing grains, namely wheat, barley, rye, oats and flaxseed were of generally high quality. 59% of carlots of wheat inspected were graded No. 1 or No. 2 Canada Eastern Winter, and 89% of carlots of barley were graded No. 2 or No. 3 Canada Eastern Six-Row.

The late-maturing crops, corn, soybeans and pea beans were helped by timely rains in early September, and subsequent fine harvest weather produced good average quality in these crops. Frost in some areas was as early as September 14 and did limited damage to late crops of soybeans; 81% of soybeans inspected were graded No. 1 or No. 2 Canada Yellow, including 26% tough and damp.

77% of pea beans were graded No. 1 and Extra No. 1 Canada Eastern; the colour was very good and incidence of damage from disease was low.

55% of cars of corn inspected qualified for straight grades (dry or extra dry) No. 1 and No. 2 Canada Eastern; 44% of all cars inspected were off-grade on account of excessive moisture content.

Control of Drying of Grain

The great volume of 1959 crop grain that was threshed with high moisture content taxed drying facilities to the utmost. Dryers at terminal elevators worked at full capacity through the winter and spring; over 53 million bushels were dried in the terminals under strict supervision of the Grain Inspection Branch. The Board's Research Laboratory gave excellent collaboration in the testing of samples to determine effects of drying on the quality of the grain.

Dryers were also set up in some farming areas, to cope with the problem of storing and shipping damp grain. An assiduous, extensive operation, conducted jointly by the Research Laboratory and the Inspection Branch, resulted in such control of drying that damage to grain was held to an almost negligible level.

The small amount of grain shipped that was damaged in drying was graded Rejected Dried.

Samples Submitted For Grading

18,628 samples submitted by country elevator operators and farmers, "subject to inspector's grade and dockage", were graded during the 1959-60 crop year, compared to 13,627 during the previous crop year.

Farmers' Complaints on Carlot Shipments

During the crop year 1959-60, the Inspection Branch received 51 requests from farmers to establish whether the identity of carlots of special bin grain had been preserved in the handling through country elevators. In 13 instances it was established that the identity of the farmers' grain had not been preserved. Appropriate settlements were made by the elevator operators in these cases.

Extension of Grain Inspection Services

The construction of the 12-million bushel elevator at Baie Comeau on the Lower St. Lawrence River, required the establishment of official grain inspection service there in order to provide final certificates of grade on outward vessel shipments. The Board provided staff for the inspection of Canadian grain, and the United States Department of Agriculture provided staff for the grading of U.S. grain. The U.S. Department of Agriculture also opened an office in Montreal to handle the grading of their grain at the elevators in the Upper St. Lawrence district.

Kernel Characteristics of Varieties

The Inspection Branch provides a special service to plant breeders in the Department of Agriculture by examining and reporting on the kernel characteristics of new varieties and hybrids of red spring, amber durum and winter wheat and barley.

The report points out the desirable and undesirable kernel characteristics of each variety and describes the appearance of the sample in comparison with the normal appearance of high quality Canadian red spring wheat.

Preliminary reports are made directly to plant breeders on new varieties in their earliest stages of development. This gives the plant breeder invaluable guidance in deciding which varieties he should continue to develop. In the final stages of development, a detailed report is made to the plant breeders and the Associate Committee on Grain Research. This report is of value when the variety is considered for licensing.

In 1960, almost 2,000 samples, representing 135 new varieties and selected lines of established varieties, were examined and reported on.

The constant production of new varieties has made it necessary to institute a more intensive program of staff training in varietal identification for our inspectors. This has been done in conjunction with an expanded staff training program for Grain Inspectors and Grain Inspection Assistants, which was inaugurated throughout the system this year.

In connection with this work, the Inspection Branch prepared for publication an illustrated handbook entitled "Identification of Barley and Wheat Varieties by Kernel Characters", especially for the use of Grain Inspectors and grain handlers. This publication has been well received by the grain trade and agricultural institutions in Canada, the United States of America, and overseas.

Changes in Malting Grades of Barley

In response to a request made in the meeting of the Committee on Western Grain Standards in October, 1959, the Board investigated problems regarding grades of barley. In meetings with representatives of all interests in the malting barley business, from farmers to exporters, it was established that much barley being admitted to "malting" grades was being demoted to "feed" grades for two reasons, (1) due to unavoidable increase in peeled and broken kernels in handling at terminal elevators, barley received containing within one percent of the maximum tolerances in the malting grades would usually not qualify for the same grades on delivery from the terminals, and (2) much barley being admitted into top grades was not acceptable by domestic or foreign maltsters on account of small kernel size. Therefore, in the interests of the growers of barley of true "malting" quality, kernel size specifications were introduced, and tolerances of peeled and broken kernels were reduced in the grades of No. 2 and No. 3 Canada Western barley. Also, the commercial grade of No. 4 Canada Western Six-Row barley was rescinded because it had proved useless. These changes were made effective on August 1, 1960.

Collaboration with U.S.A. Grain Inspection Service

The increased handling of United States grain through Canadian elevators resulting from the St. Lawrence Seaway development, led to their Department of Agriculture establishing grain inspection offices at Montreal and Baie Comeau to provide official United States inspection of their grain.

Negotiations with officials of the United States grain inspection service were completed by the Board's Chief Grain Inspector on the occasion of his attendance at a biennial conference of senior officials of the United States service in Toledo, Ohio, May, 1960. A practical, satisfactory program was set up, including arrangements for the Board to provide sampling service for the United States inspectors at the elevators in the St. Lawrence.

Improvements in Equipment

During the year the Inspection Branch participated in the testing of experimental apparatus for sampling of grain by mechanical means in various types of elevator installations. This was done in conjunction with the regular program of control of sampling, particularly in terminal and Eastern elevators. This work resulted in some new installations of mechanical samplers in terminals, and the prospect of several more units being installed.

Increasingly exacting specifications require more and better equipment for grading. For example, when the assessment of dockage on export shipments of oil seeds was changed from the nearest one-half of a percent to the nearest one-tenth percent, this dictated the need for faster, more precise scales, cleaning machines and sieves; similarly, new precision equipment became necessary with the introduction of requirement as to size of kernels in the top grades of barley.

Improvements in accuracy and speed of testing grain for moisture were introduced with the technical assistance of the Board's Research Laboratory. An electrical meter supplanted the older distillation method for the testing of some kinds of grain.

The program for acquisition of better equipment, while short of known requirements, made significant progress during the year.

Staff Training

The rate of introduction of new kinds and varieties of grain in Canada in recent years and a new method of recruiting prospective grain inspectors, have required a real expansion of the training program for grain inspectors and grain inspection assistants. This phase of staff training has become an increasingly significant function of the Inspection Branch head office. A senior inspector of the Chief Inspector's staff handles this important project. In the winter of 1959-60 this officer made a trip to offices through the system to give personal instruction and guidance to staff. In addition, he directed a program of staff training that is conducted through the year by senior grain inspectors at all points.

Visitors to the Inspection Branch

During the 1959-60 crop year, 81 people from foreign countries visited in the head offices of the Board's Inspection Branch, and many of these also visited terminal points where they were shown how the inspection services function. The visitors included officials of foreign governments, men in private grain trade, and members of the Canadian Foreign Trade Service.

These visits are invaluable to trade relations; the effectiveness of the Canadian inspection system obviously makes a good impression on these people who play important roles in the marketing of our grain.

Western Division

APPENDIX E

Grain Weighing Branch

J. J. MANSON, *Chief Grain Weighman*

Under the provisions of Sections 33 and 124 of the Canada Grain Act, all grain received into or shipped from licensed terminal elevators is weighed under supervision of the Board's weighing staffs. Weighing services are also provided at licensed mill elevators in the Western Division.

During the Crop Year 1959-60 services were provided at forty-five semi-public and private terminal elevators and when required, at twenty-nine mill elevators in the Western Division.

All scales and equipment for transferring grain to scales on receipt and from scales for shipment in all licensed terminal elevators and serviced mill elevators were regularly inspected during the crop year under provision of Section 92 of the Act.

In accordance with the special arrangement with the Standards Branch of the Department of Trade and Commerce, all scales in licensed terminal and eastern elevators were inspected, verified and stamped by the Board's Scale Inspector acting as an inspector under the Weights and Measures Act.

A semi-annual inspection was also made of all scales in terminal elevators to ascertain if scales were maintaining their accuracy. Special inspections were made when any doubt arose as to the accuracy of any scale.

Attention has been given to alterations in elevators and dust control installations to ensure that such changes or alterations do not affect the accuracy of the weighing of grain received at or shipped from these elevators.

The bringing into operation of the Deep Seaway has enabled deep sea vessels to proceed to the Lakehead to load grain cargoes. In this connection, several of the Lakehead elevators and particularly new constructions, are changing their systems of loading in an endeavour to better facilitate the loading of deep sea ships.

A new type of steel tank storage bin is being constructed at one of the Port Arthur elevators.

During the crop year under review, 273,201 carlots of grain were weighed on receipt at terminal and mill elevators in the Western Division, and of these carlots, 54,986 or 20.1% were reported leaking and 5,730 or 2.1% were reported without seals or had defective seals. There was also a total of 16,793 cars weighed out of terminals.

The Branch maintained a close checking of reported outturns at eastern elevators of cargoes loaded at Lakehead elevators and investigations were made in cases of reported excessive shortages with a view to assessing the liability where such could be established.

Under the provisions of Sections 139 and 140 of the Canada Grain Act, weighovers were conducted at twenty-five terminal elevators and twenty eastern elevators. Results of weighovers were submitted to the Board for comparison with records of outstanding warehouse receipts and preparation of official statements. The Board found it necessary to defer several terminal and eastern elevator audits due to heavy stocks of grain in store.

The CHAIRMAN: Appendices B, C, D and E agreed to.

Mr. McCONNELL: On page 55 there are two things which should be mentioned. Most of the companies, under the labour statutes of the province of Ontario, have had to spend large amounts of money for ventilation and dust installations because of the explosion which took place at the lakehead. We are watching it with a great deal of interest; and I think the Manitoba pool is building from \$3½ to \$5 million of new space in steel tanks. These will be the first steel tanks for storage we have ever had at the lakehead.

Mr. HORNER (*Acadia*): Are they to be floating?

Mr. McCONNELL: No. I do not know what the capacity is, but we have had no storage in steel tanks before. They are big, round, Butler-type of buildings, with two million capacity.

Mr. MacLEOD:

APPENDIX F

The Grain Research Laboratory

J. ANSEL ANDERSON, *Director*

Section 22 of the Canada Grain Act requires that "the Board shall maintain an efficient and adequately equipped laboratory for research work in relation to grain."

The following summary of the Laboratory's work for 1960 deals with the quality of Canadian grain marketed in the 1959-60 crop year, the quality of 1960 grain crops, and research and other activities. In accordance with previous practice, a separate annual report will be published by the Laboratory to put on record data on the quality of Canadian grain and progress made in research.

Quality of Grain Marketed in 1959-60

Throughout the crop year, the Laboratory continued to study the quality of spring wheat, durum wheat, barley, flax and other cereal grains at various stages of marketing. Detailed data obtained in these studies will be reported in the Laboratory's 1960 Annual Report.

Protein content of Canadian wheat has averaged about 14% for four successive years; accordingly, wheat from the carryover and wheat from the 1959 crop provided ample supplies of high quality grain throughout the 1959-60 crop year. Compared to the previous crop year, wheat marketed in 1959-60 was slightly higher in protein content and a little lower in bushel weight. Baking absorption and baking strength were high and supporting value was good. The relation between dough elasticity and extensibility was satisfactory. Wheat shipped from Pacific ports was more variable in quality than wheat shipped from Atlantic ports. Durum wheat marketed in 1959-60 was high in protein content but slightly lower in bushel weight than last year. Macaroni-making quality was excellent and rheological properties were somewhat better for the lower grades in this crop year. Malting barley was slightly lower in bushel weight, yield of plump barley, and yield of malt extract, than in 1958-59. Flax and rapeseed shipments were higher in average quality compared to those of the previous crop year.

Estimated Quality of 1960 Crops

Good moisture reserves and adequate spring rainfall got 1960 western grain crops away to an excellent start, but near-drought conditions that began in mid-July and continued throughout the remainder of the growing season reduced prospects of above-average yields. Most crops stood up surprisingly well to the drought, and harvesting was completed by mid-October under ideal weather conditions. Estimates of production for 1960 western crops are: wheat, 470 million bushels (including 16.3 million bushels of durum wheat); barley, 201 million bushels; flax 24.9 million bushels; and rapeseed, 551 million pounds. There was very little tough and damp grain, and crops were practically free of the various types of damage associated with adverse harvesting weather.

The Hard Red Spring wheat crop is high in grade, protein content, baking strength and supporting value. Compared to 1959-60 fourth quarter cargo shipments, bushel weight is lower this year, but the Northern grades mill very well and give high yields of flour of good color and satisfactory ash. Baking absorption and gassing power are both satisfactory, and doughs handle well during the baking process. Physical dough tests show a good balance between extensibility and elasticity. Average protein content at 14.2% is equal to the third highest on record. About 85% of the wheat will grade No. 2 and No. 3 Northern; there will be some No. 4 Northern but very little No. 1 Northern. The 1960 crop will ensure continued supplies of high-quality grain in commercial channels during the current crop year.

The Amber Durum wheat crop will be predominantly No. 2 and No. 3 C.W., about 10% will grade Extra No. 4 C.W. and there will be very small amounts of No. 1 and No. 4 C.W. The crop is high in protein, a little higher in bushel weight for the top grades than last year, but kernel weight is lower. The wheat is vitreous, mills well, and gives good yields of semolina. Yellow pigment is high and rheological properties and macaroni quality are excellent. As the new crop becomes blended with wheat in the carryover, protein content and macaroni color will be maintained and rheological properties will be improved, particularly in the lower grades.

The barley crop withstood the lack of moisture fairly well. Compared to last year, bushel weight is lower and nitrogen is higher which will result in a reduced yield of malt extract. Yield of plump barley will be high in the Six-row grades. A reduction in the tolerance for peeled and broken kernels and the introduction of a sieving test into the grading system on August 1, 1960, will contribute to a better class of barley for domestic use and for export.

The flax crop is of good average quality but the quality of the rapeseed crop was reduced by the drought conditions. Average results for the flax crop show that oil content is 41.4%, iodine value is 186 units, and protein content is 45.7%. Average results for the rapeseed crop are 41.3% oil and 43.2% protein.

Bulletins and Maps

Quality information for different grades of 1960 western grain crops was presented at the October meeting of the Committee on Western Grain Standards and later was published in maps and crop bulletins, i.e., two wheat protein maps (preliminary and final—5,200 copies); two bulletins on wheat (11,400 copies); one bulletin on barley (4,000 copies); and one bulletin on flax and rapeseed (1,000 copies). Distribution of these publications is made by mail and over the counter by the Laboratory, and also by the Canadian Wheat Board, the Grain Division, Department of Trade and Commerce, Ottawa, and Canadian Government Trade Commissioners. The Bulletin "Canadian Wheat 1959" was also distributed by Canadian representatives at the Netherlands Baking Foundation (NEBATO) Exhibition in Amsterdam last spring. Press releases preceded publication of all these reports.

Publication of the two quarterly bulletins (one on red spring wheat cargoes and one on durum wheat cargoes) was continued to the end of the 1959-60 crop year. Beginning with the first quarter of the 1960-61 crop year these two bulletins were published in English, French, German and Spanish instead of in English only. It is hoped that this important change will bring the bulletins to the attention of a greater number of readers in more countries. Distribution of quarterly bulletins will continue to be made by Canadian Government Trade Commissioners, who receive their supplies direct by air mail, and by the Laboratory.

Service to Grain Inspection Branch

During the year the Laboratory continued to work closely with the Grain Inspection Branch by providing such services as are required to aid in grading and associated problems. The more important work dealt with the quality tests on dried wheat, preliminary tests on samples that were used to make up Standard samples, and detailed quality studies on tentative Standard and Standard Export samples. Supervision of moisture-testing equipment in Inspection Offices continued as one of the Laboratory's main services to the Inspection Branch. Seventy-five CAE moisture meters have been installed in the various Inspection Offices. The meter has been calibrated for red spring wheat, barley, oats, flax and rapeseed, and it is now used almost exclusively for moisture tests on these grains. A regular check test system has been instituted, and results have shown that meters are being operated with a high degree of accuracy.

Other work for the Inspection Branch included: mercury detection in grain treated with mercurial fungicides, lipoxidase determinations on durum wheat, fatty acid tests on oil seeds, and a study of the relation between oil content of rapeseed and seed size.

Grain Drying 1959 Crop

The wet weather during the 1959 harvest was reminiscent of 1951 when nearly half the crop delivered was tough or damp. Over 53 million bushels of the 1959 crop were dried at Canadian terminal elevators, an estimated 5 million bushels of wheat were dried on farms, and about 56 million bushels of unthreshed wheat were left in the field under the snow all winter; most of this wheat however, was threshed in a dry condition in the spring of 1960.

The Laboratory provided a quality testing service for samples from three sources; Terminal elevator dryers, farm drying, and Inspection Office (carlots, cargoes, etc.). All Laboratory tests on dried wheat were made by a special Mixograph technique on corresponding before-drying and after-drying samples. When necessary, milling and baking tests were used to confirm the results.

As drying operations at terminal elevators are under the supervision of the Board's Inspection Branch, there was no difficulty in introducing previously established control procedures. Tests were made on samples from each elevator as soon as drying operations were started and were continued until satisfactory drying was established; periodic tests were made thereafter. The major difference between 1959 and 1951 drying operations was that the 1959 wheat was sometimes higher in moisture content. This necessitated a readjustment (principally a lowering of air temperature) of dryers at some elevators to assure safe drying conditions. All dryers installed at Lakehead and Pacific terminals were inspected by personnel from the Laboratory and the Inspection Branch.

In 1959, as in 1951, the Laboratory was faced with the problem of farm drying. Because of congestion in country elevators, farmers were unable to make immediate delivery of their tough and damp grain, and many purchased dryers. Since 1951, farm dryers have undergone further development in the United States where most of them are manufactured. There are many different makes; they are mostly portable recirculating batch dryers fired by propane gas, holding capacity ranges between 200 and 400 bushels, and the cost varies from about \$3,000 to \$6,000. In 1959 there were 14 different makes in use in Canada, comprising a total of 269 dryers, and most of them were in operation in the northern half of Saskatchewan and in northern and western Alberta. As was to be expected, many of the dryers were improperly operated when first put into use, thereby causing considerable damage to the

quality of the grain. To help farmers establish safe drying conditions the Laboratory offered a free testing service on before- and after-drying samples, publicity material was prepared and distributed, radio and television talks were given to warn farmers of the danger of spoiling grain by improper drying, and areas where the problem was most acute were visited by Laboratory personnel. A review of the Laboratory tests shows that there was a marked improvement as farm drying operations progressed.

The Laboratory also co-operated with the Agricultural Machinery Administration Branch of the Saskatchewan government in testing five main makes of farm dryers at their proving grounds in Regina. Results of tests are published in Saskatchewan government A.M.A. publications.

As farm-dried grain would eventually find its way into carlots, the Laboratory set up a program of testing carlots originating at stations in areas where farm drying was being done and which were suspected of containing dried grain. At the outset, a rapid stain test for detecting dried grain, developed by the Laboratory, was used by the Inspection Branch, but experience showed that although the test was positive for barley it was not foolproof for wheat. In these circumstances inspectors had to rely on their judgment in deciding whether a carlot might contain dried wheat and warrant further testing.

The number of tests made by the Laboratory in controlling drying operations during the 1959-60 crop year were as follows: Terminal elevators 840 (1,680 samples); farm dryers 658 (1,316 samples); and inspection samples, carlots, etc. 810. The total number of samples tested was thus 3,806.

Variety Testing

The Laboratory has continued to take a leading part in quality tests of varieties of spring wheat, durum wheat, western winter wheat, and malting barley developed by Canadian plant breeders; these annual studies are sponsored by the Associate Committee on Grain Research. Large seed supplies of Pembina and Canthatch (the two new bread wheat varieties licensed in 1959) have been built up for commercial production in 1961, and it is estimated that 200,000 bushels of Pembina and 450,000 bushels of Canthatch are in farmers' hands for spring seeding. As Pembina is more resistant to both stem and leaf rust than Selkirk, it is expected that the former will displace the latter in some parts of Manitoba and eastern Saskatchewan. Similarly, Canthatch will probably displace Thatcher in some of the other areas in Saskatchewan because of its greater stem rust resistance. Neither of these two varieties is expected to be grown to any extent in Alberta where Thatcher is the predominant variety.

Studies of varieties grown in the Uniform Quality Nursery have been continued, and Canadian plant breeders have been kept informed of the results. This information is utilized for selecting parent stock that combines desired agronomic characteristics with promising qualities. As in the past, the Laboratory has continued to participate in quality studies of wheat varieties grown in the United States under the auspices of the Crop Quality Council, formerly the Northwest Crop Improvement Association. Canadian as well as United States varieties are usually in these tests.

Three new barley varieties (Betzes, Palliser and Jubilee) were licensed by the Canada Department of Agriculture this year for release to farmers. Betzes, an introduction from Poland, is a Two-row rough-awned barley that is eligible for the malting grades. Palliser, which originated from the cross Vantage x Compana, is a Two-row smooth-awned variety that can grade no higher than No. 3 C.W. Two-row. Both varieties are suitable agronomically for growing in southwest Saskatchewan and southeast Alberta, and it is likely that they will replace Compana. Jubilee is a high-yielding rust-

resistant Six-row feed-type barley produced from a cross in which Peatland, Regal, O.A.C.21, and Husky were parents. It is adaptable over a wide area in the central prairies. As there is increasing interest in Two-row barley for production in Western Canada, studies are in progress on some of the newer varieties from Europe. Their malting properties are being examined to determine their suitability as parent stock in the breeding program.

Services to Other Organizations

As in the past the Laboratory's services and technical advice have been given to the Canadian Wheat Board, Commercial Counsellors and Trade Commissioners, and other Government agencies. Much of this work relates to promotion of sales of Canadian grain and plans have been made for an expansion of this program. Comparative quality tests on Canadian wheat and competing wheats from other countries continue to be made in a systematic manner, and the Canadian Wheat Board is informed of the results.

Co-operation in some projects has been maintained with the Brewing and Malting Barley Research Institute, Winnipeg, with the Crop Quality Council, Minneapolis, with certain branches of the Canada Department of Agriculture, and with Canadian grain companies. The Laboratory has continued active participation in the work of the American Association of Cereal Chemists and the International Association for Cereal Chemistry.

Research

Considerable improvement in the facilities and program of basic research has taken place during the year. This is consistent with the generally accepted policy that the Board's Research Laboratory should serve as the principal Canadian centre for research on cereal grain. Modern facilities for studies of the physical chemistry of wheat proteins, amino acid analysis, and lipid chemistry are being acquired.

Further progress has been made in basic research on the physical properties of dough (rheology), an area in which the Laboratory enjoys a high reputation among cereal laboratories in other countries. Kinetic studies of the reaction of bromate in dough are providing basic information on dough chemistry. Considerable success has been achieved in research on the chemistry of lipides in flour and their role in determining the quality of flour.

In applied research on wheat, further improvements have been made in experimental milling techniques, and for hard red spring wheat, results are now equal to those obtained by top commercial mills; research is now being directed to achieving similar performance in milling semolinas from durum wheats. The study of wheat conditioning techniques has been proceeding concurrently with this program. A program of research is once again under way on durum quality, seeking more effective means of measuring and expressing macaroni color. With the recent acquisition of suitable equipment, the investigation of the mechanism of flour deterioration during storage is being reopened. Again this year a number of smaller research projects have been carried out in connection with problems raised by local crop conditions or by overseas buyers.

The four additional malting units for use in barley research have been completed and will be in operation shortly. This completes the program of construction begun several years ago, and provides improved facilities for both service studies and research. During the past year, investigations of varieties of different wort nitrogen content indicate that low wort nitrogen in varieties is accompanied by basic deficiencies, probably of enzymatic nature, which cause reduced brewhouse yield and wort fermentability. Two

cytolytic enzyme systems that differ widely in ratio of viscosity-decreasing activity to saccharide-production activity have been isolated and are under study. As barley anthocyanogen pigments have been recently implicated in production of chill haze in beer, studies on the occurrence of these in Canadian barleys and malts are now under way, and varietal differences in rate of pigment degradation during mashing have been established. In this area, information is being exchanged with the Haze Committee of the European Brewery Convention.

During the year 13 scientific papers dealing with the more basic aspects of research in the Laboratory have been published or have been accepted for publication in scientific journals.

Staff and Facilities

Dr. Narayanan of the Central Food Technological Research Institute, Mysore, India, who, a year ago, received a National Research Council Post Doctorate Fellowship, tenable in the Laboratory, was given an additional award for another year to make it possible for him to continue his studies on lipides and antioxidants under Dr. Hlynka. Mr. R. R. Matsuo is continuing his leave at the University of Alberta where he is studying for a Ph.D degree. Dr. E. J. Bass resigned his position as chemist, after 12 years of service in the Laboratory, to take a senior position with the International Milling Company, Minneapolis. Miss Jean McMullan resigned her position to be married, and Mrs. Cecylia Marek replaced her on the professional staff. One of the two positions for summer students was filled by Mr. Barry McLennan. Several resignations and additions also occurred in the sub-professional staff.

Additional space acquired during the year is being outfitted into an office and laboratory area. The durum wheat equipment will be moved into this area to relieve overcrowding in the baking section.

Overseas Visits and Visitors

In the late spring Dr. Anderson went overseas to attend three scientific meetings: the Congress of International Association for Cereal Chemistry in Vienna, Austria (Dr. Anderson was president of this society); the Scandinavian Association of Cereal Chemists in Oslo, Norway; and the Netherlands Section of Belgian-Netherlands Association for the Study of Cereals, Wageningen. His itinerary also included visits to the Scandinavian countries, Switzerland, Belgium and the United Kingdom. In the fall of the year Dr. Anderson accompanied the Chief Commissioner to Japan and Hong Kong. From there he went to Australia to attend the meeting of the Royal Australian Chemical Institute at Leura. Dr. Anderson also visited wheat-growing areas in northern New South Wales and southern Queensland to study production, handling and storage of Australian grain. The wheat industry in New Zealand was also studied during a short visit to both North and South Islands. Research institutions were visited in both countries and addresses were given to various groups of millers, bakers and cereal chemists.

Dr. Irvine represented the Board of Grain Commissioners at the Netherlands Bakery Foundation (NEBATO) Exhibition in Amsterdam early in the spring. After the meeting, he visited mills, bakeries and research institutions in the United Kingdom, France, Germany and Belgium.

The Laboratory was visited by missions from India, Peru and the Federal Republic of Germany. There were also visitors from the Far and Middle East, Europe, South America, South Africa, New Zealand, Australia, United Kingdom, and U.S.A.

The CHAIRMAN: Appendix F agreed to.

Mr. HORNER (*Acadia*): Under shipments I note that they are always very low from the Moose Jaw interior elevator. What is the reason for that?

Mr. McCONNELL: The simple reason is because we have been carrying a lot and have had more active movement out of the west coast. Some of that grain must be anywhere from four to six years old. However it is clean and ready to ship. And moreover we have been earning storage on it. But there has not been much turnover in volume.

Mr. HORNER (*Acadia*): What can be done about it?

Mr. McCONNELL: It is again up to the wheat board. If they do not order it out, we have nothing to do with it, except that we continue to earn storage. But I believe it is moving now.

Mr. MacLEOD:

APPENDIX G

Canadian Government Elevators

A. E. JACOBSON, *General Manager*

In accordance with the provisions of Section 166 of the Canada Grain Act and Order-in-Council P.C. 1372 of August 19, 1925, the Board manages and operates five interior terminal elevators at Moose Jaw, Saskatoon, Calgary, Edmonton and Lethbridge, and one terminal elevator at Prince Rupert, and leases one terminal elevator at Port Arthur.

In the 1959-60 crop year, interior and Prince Rupert elevators continued to be operated under a Semi-Public Terminal Elevator License. Port Arthur continued under lease to McCabe Grain Company Limited.

Handlings

Receipts in 1959-60 were 7.8% lower than in 1958-59 (17.4 million bushels, 18.9 million bushels). Shipments were up by 8.5% (18.1 million bushels, 16.7 million bushels) which is reflected in a lower in-store figure at the end of the crop year. Wheat receipts were 4.1 million bushels (24% of total receipts) and barley receipts were 11.6 million bushels (66% of total receipts). Thus, wheat and barley totalled 90% of all receipts. Receipts of rapeseed dropped from 4.6 million in 1958-59 to 1.6 million in 1959-60. Rapeseed was handled at Saskatoon, Calgary and Edmonton; Prince Rupert handled barley only. Receipts and shipments by elevator were as follows:

Elevator	Capacity	Stocks August 1, 1959	Net Receipts	Net Shipments	Stocks July 31, 1960	Audit Adjust- ments
	million bu.	bu.	bu.	bu.	bu.	bu.
Moose Jaw.....	5.50	5,395,723	165,297	185,820	5,375,200	—
Saskatoon.....	5.50	4,379,042	1,396,786	2,235,011	3,540,817	—
Calgary.....	2.50	1,005,479	3,679,424	3,787,733	896,512	-658
Edmonton.....	2.35	1,248,953	2,268,420	2,689,304	828,003	- 66
Lethbridge.....	1.25	950,371	434,064	336,684	1,047,751	—
Prince Rupert.....	1.25	341,229	9,475,678	8,896,326	920,581	—
Totals.....	18.35	13,320,797	17,419,669	18,130,878	12,608,864	-724

Charges

Storage charges at all elevators are unchanged: Interior elevators at 1/45¢, Prince Rupert at 1/30¢ per bushel per day. Storage and elevation charges at Prince Rupert are the same as those in effect at the Lakehead and other Pacific Coast ports. Elevation charges at the interior elevators on wheat, oats, barley and corn are 1¼¢ per bushel, 1¢ per bushel lower than charges at the Lakehead and Pacific Coast ports; charges on rye and flax at 1¼¢ per bushel and 2⅜¢ per bushel respectively, are both 1½¢ per bushel lower than at the Lakehead and Pacific Coast ports.

Maintenance

Concrete restoration at the Saskatoon Elevator by the Repair and Reconstruction Unit is virtually completed; the only substantial part left to do being the painting. Similar work is being done in Moose Jaw and is now well advanced. Buildings, machinery and trackage continued to be maintained in good condition.

Work was completed on the installation of dry stand pipes for fire protection at all elevators. The modernization of electrical fixtures and light distribution systems, in compliance with elevator safety codes, is proceeding at Moose Jaw, Saskatoon and Calgary and is almost completed. Similar work was started this year at Edmonton and Prince Rupert. At Port Arthur, electro-magnets were installed to remove metal from grain; a vessel loading spout was installed; the heating system in office buildings revised; and some work was done in repairing revetment channels and tie rods on the dock. At Calgary, one drier was completely replaced by a Randolph direct-heat oil fired unit, thus permitting the drying of all grains, including small oil seeds such as Rapeseed, which was not possible with existing equipment. The other drier was converted from coal to oil heat. At Edmonton, a garner alarm signal system was installed. At Prince Rupert, the railway trestle was replaced in its entirety.

Staff

Staff employed as at December 31, 1960, compared with figures at December 31, 1959, is as follows:

	1960		1959	
	Continuing Establishment	Casuals	Continuing Establishment	Casuals
Winnipeg (Head Office).....	8	—	8	—
Moose Jaw.....	32	—	32	—

APPENDIX I

Regulations

Regulations in effect December 31, 1960, made in accordance with the provisions of the Canada Grain Act

Regulation
No.

- 1 Registration and Cancellation of Terminal Elevator Warehouse Receipts.
- 2 Registration and Cancellation of Eastern Warehouse Receipts and Transfer Receipts.
- 3 Plans re Terminal and Eastern Elevators.
- 4 Cleaning of Grain and Bins.
- 5 Off Grades for Western Grain.
- 6 Off Grades for Eastern Grain.
- 7 Grades of Screenings.
- 8 Inspection of Samples taken other than at an Inspection Point.
- 9 Appeals from Inspecting Officers to Grain Appeal Tribunals.
- 10 Delivery of Grain to Ocean Vessels at St. Lawrence Ports.
- 11 Delivery of Grain to Ocean Vessels at West Saint John, N.B.
- 12 Delivery of Grain to Ocean Vessels at East Saint John, N.B.
- 13 Delivery of Grain to Ocean Vessels at Halifax, N.S.
- 14 Enforcement of Lien by Sale of Grain.
- 15 Drying of Grain.
- 16 Fees.
- 17 Records, Reports and Returns.
- 18 Procedure, Country Elevators.
- 19 Receipt for Grain Delivered to Private Country Elevators and Mill Elevators.
- 20 Maximum Tariff of Charges, Eastern Elevators.
- 21 Maximum Tariff of Charges and Shrinkage Allowance, Country Elevators.
- 22 Maximum Tariff of Charges, Terminal Elevators.
- 23 Applications for Licenses, and Terms and Conditions under which Licenses are issued.
- 24 Storage in Transit of Grain Grown Outside Canada.
- 25 Tickets and Receipts—Country Elevators.
- 26 Grain Treated with Poisonous Materials.
- 27 Shipment of Infested Grain.

The CHAIRMAN: Appendices G, H and I agreed to.

Mr. HORNER (*Acadia*): I have one question. On page 23 with regard to licensing. I think you said this morning that nine roundhouses were licensed for the storage of grain. Would they all be licensed to the one line company?

Mr. McCONNELL: Oh no, no. I would say they might be all to different companies. The only requirement is that the company which licenses them as an annex must have an elevator operative at the point.

Mr. THOMAS: Mr. Chairman, if it is in order I would like to move a vote of thanks to the board of grain commissioners for their presentation of the report.

Mr. HENDERSON: I second the motion.

The CHAIRMAN: I am sure, gentlemen, that as chairman I may express your appreciation for the dispatch with which this report was presented today, and I am sure the report is very encouraging. We hope to see you back next year—whether or not we are here—when no doubt you will be presenting a bigger and better report before the agricultural committee. Once again we thank you for being with us. No doubt the bell will be ringing very shortly.

Mr. McCONNELL: I would like to say thank you very much on behalf of the board, and to extend to you a hearty invitation to call at our office in Winnipeg so we may show you our grading, our baking lab, and everything. We will be very happy to welcome you.

ORDER OF REFERENCE

WEDNESDAY, June 21, 1961.

Ordered,—That the *Annual Report of the Canadian Wheat Board for the Crop Year ended July 31, 1960*, which was tabled on March 3, 1961, and the *Report of the Board of Grain Commissioners for 1960*, which was tabled on April 12, 1961, and the *Supplementary Report of the Canadian Wheat Board on the 1959-60 Pool Account for Wheat, Oats and Barley*, tabled today, be referred to the Standing Committee on Agriculture and Colonization.

Attest.

LÉON-J. RAYMOND,
Clerk of the House.

REPORT TO THE HOUSE

WEDNESDAY, July 5, 1961.

The Standing Committee on Agriculture and Colonization has the honour to present the following as its

SECOND REPORT

On June 21, 1961, the Committee received from the House the following Order of Reference:

Ordered,—That the Annual Report of the Canadian Wheat Board for the Crop Year ended July 31, 1960, which was tabled on March 3, 1961, and the Report of the Board of Grain Commissioners for 1960, which was tabled on April 12, 1961, and the Supplementary Report of the Canadian Wheat Board on the 1959-60 Pool Account for Wheat, Oats and Barley, tabled today, be referred to the Standing Committee on Agriculture and Colonization.

Your Committee carefully examined and approved the operations of the Canadian Wheat Board and the Board of Grain Commissioners for Canada.

Your Committee commends the Minister of Agriculture and the Canadian Wheat Board for their excellent efforts in the export sales of wheat and expresses hope for their continued success.

Your Committee is interested in the permanent liaison committee proposed by the Minister of Agriculture to be set up between eastern feeders and the Canadian Wheat Board.

Your Committee commends the Board of Grain Commissioners on its handling of the unusual 1959 wheat crop.

A copy of the Committee's Minutes of Proceedings and Evidence, respecting the above-mentioned matters, is appended.

Respectfully submitted,

JAMES A. McBAIN,
Chairman.

MINUTES OF PROCEEDINGS

MONDAY, June 12, 1961.

(30)

The Standing Committee on Agriculture and Colonization met *in Camera* at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Belzile, Clancy, Clermont, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), Horner (*Jasper-Edson*), Howe, Knowles, McBain, Muir (*Lisgar*), Noble, Peters, Rapp, Ricard, Smallwood, Southam, Stefanson, Thomas, and Tucker.—(22).

Agreed.—That the Subcommittee on Agenda and Procedure prepare a draft report on farm machinery prices for discussion on Friday, June 16.

The Chairman announced that the Board of Grain Commissioners would appear before the Committee on Friday, June 23 and the Canadian Wheat Board on Monday, June 26 and Tuesday, June 27.

At 10.40 a.m. the Committee adjourned to the call of the Chair.

THURSDAY, June 15, 1961.

(31)

The Standing Committee on Agriculture and Colonization met, *in Camera*, at 9.55 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Campbell (*Lambton-Kent*), Cooper, Danforth, Doucett, Fane, Forbes, Horner (*Acadia*), Knowles, Lahaye, McBain, Muir (*Lisgar*), Pascoe, Peters, Rapp, Smallwood, Southam, Tucker, and Webb.—(19).

On behalf of the subcommittee on Agenda and Procedure, the Chairman presented a draft of a Report to the House.

After discussion thereon, it was decided to hold a further meeting.

At 10.50 the Committee adjourned to the call of the Chair.

WEDNESDAY, June 21, 1961.

(32)

The Standing Committee on Agriculture and Colonization met, *in Camera*, at 3.00 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Clermont, Danforth, Fane, Forgie, Gundlock, Henderson, Hicks, Horner (*Acadia*), McBain, Mandziuk, Muir (*Lisgar*), Nasserden, Rapp, Smallwood, Southam, Thomas, Thompson, Tucker, and Webb.—(20).

The Committee considered, amended and adopted a draft report on farm machinery prices for presentation to the House.

At 3.30 p.m. the Committee adjourned until Friday, June 24, at 9.30 a.m.

MONDAY, June 26, 1961.

(35)

The Standing Committee on Agriculture and Colonization met at 9.35 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Campbell (*Lambton-Kent*), Clermont, Danforth, Doucett, Forbes, Henderson, Hicks, Horner (*Acadia*), Howe, Knowles, Korchinski, McBain, Mandziuk, Milligan, Montgomery, Muir (*Lisgar*), Nasserden, Noble, Pascoe, Rapp, Rogers, Southam, Stefanson and Webb.—(25).

In attendance: From the Canadian Wheat Board: Messrs. W. C. McNamara, Chief Commissioner; W. Riddel, Assistant Chief Commissioner; W. E. Robertson, Commissioner; C. E. G. Earl, Comptroller-Secretary; H. B. Monk, Solicitor and C. B. Davidson, Executive Assistant.

The Chairman introduced Mr. McNamara, who in turn, introduced the officials of the Canadian Wheat Board.

The members received a copy of

1. Report of the Canadian Wheat Board—Crop Year 1959-1960.
2. Supplementary Report of the Canadian Wheat Board on the 1959-1960 Wheat Account, 1959-1960 Oats Account and 1959-1960 Barley Account.

Mr. Earl proceeded to read the Report of the Canadian Wheat Board—Crop Year 1959-1960 and the officials of the Board answered questions on the different sections.

The Committee approved the following sections of Part I of the Report:

1. General Comment—Crop Year 1959-1960.
2. Crop Development and Supplies.
3. Legislation.
4. Transportation.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING

(36)

The Committee reconvened at 2.40 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Campbell (*Lambton-Kent*), Clermont, Doucett, Dubois, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), Howe, Knowles, Korchinski, McBain, Milligan, Muir (*Lisgar*), Nasserden, Noble, Pascoe, Rapp, Southam, Stefanson and Tardif.—(23).

In attendance: Same as at morning sitting.

Mr. Earl resumed his reading of the Report of the Canadian Wheat Board—Crop Year 1959-1960.

The Committee questioned the officials of the Board on and approved the following sections of Part I of the Report:

5. Delivery Quotas.
6. Handling Agreement.

At 5.00 p.m. the Committee adjourned until 7.30 p.m.

EVENING SITTING

(37)

The Committee reconvened at 7.40 p.m. The Acting Chairman, Mr. Reynold Rapp, presided.

Members present: Messrs. Boulanger, Clermont, Forbes, Henderson, Hicks, Horner (*Acadia*), Knowles, Korchinski, McBain, Mandziuk, Milligan, Muir (*Lisgar*), Nasserden, Pascoe, Rapp, Rogers, Southam, Stefanson, Tucker and Webb.—(20)

In attendance: Same as at morning sitting.

Mr. Earl continued reading the Report of the Canadian Wheat Board—Crop Year 1959-1960.

The Committee questioned the officials of the Board on and approved the following:

In Part I

- 7—1959-60 Account—Wheat
- 8—1959-60 Account—Oats
- 9—1959-60 Account—Barley
- 10—Payment Division
- 11—Legal Department
- 12—Staff and Officers
- 13—Advisory Committee

In Part II

Financial Statements

The Report of the Canadian Wheat Board—Crop Year 1959-1960 was approved.

Agreed,—that the following be made appendices to Minutes of Proceedings and Evidence regarding the Canadian Wheat Board reports:

Cost of Moving Feed Grains into Eastern Positions (*See Appendix "A"*)
Statement re Feeds Mills (*See Appendix "B"*)

- (a) Statement
- (b) Parliamentary Reports Relating to Feed Mills
- (c) Canadian Wheat Board Instructions to the Trade No. 43
1960-61 Crop Year Re: Order re Delivery of Grain to Feed Mills
- (d) Designation of Non-Quota Feed Mill
- (e) The Canadian Wheat Board Instructions to the Trade No. 41 re:
Feed Mills
- (f) The Canadian Wheat Board Comparison of Board initial prices with
prices paid by designated non-quota feed mills—Manitoba and
Saskatchewan.

The Committee proceeded to study the Supplementary Report of The Canadian Wheat Board on the 1959-60 Wheat Account, 1959-60 Oats Account and 1959-60 Barley Account.

Mr. Earl read this Supplementary report and the Committee questioned the officials of the Board on each section.

The Committee approved 1959-60 Pool Account—Oats.

At 10.00 p.m. the Committee adjourned until Tuesday, June 27th at 9.30 a.m.

TUESDAY, June 27, 1961.

(38)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Campbell (*Lambton-Kent*), Danforth, Doucett, Forbes, Gundlock, Henderson, Hicks, Horner (*Acadia*), Knowles, Korchinski, Lahaye, McBain, Mandziuk, Muir (*Lisgar*), Nasserden, Noble, Pascoe, Rapp, Régnier, Rogers, Southam, Stefanson, Tucker and Webb.—(25)

In attendance: From the Canadian Wheat Board: Messrs. W. C. McNamara, Chief Commissioner; W. Riddel, Assistant Chief Commissioner; W. E. Robertson, Commissioner; C. E. G. Earl, Comptroller-Secretary; H. B. Monk, Solicitor and C. B. Davidson, Executive Assistant.

The Chairman introduced the following interested officers to the Committee: Mr. Cecil Lamont, President and Mr. W. McIchlan, Secretary, North-West Line Elevators

Dr. W. J. Parker, President, Manitoba Wheat Pool

Mr. G. L. Harrold, President, Alberta Wheat Pool

Mr. C. W. Gibbings, President, Saskatchewan Wheat Pool

Mr. R. C. Brown, First Vice-President and Mr. H. L. Griffin, Economist, United Grain Growers

The Committee resumed consideration of the Supplementary Report of the Canadian Wheat Board on the 1959-60 Pool Account—Wheat, 1959-60 Pool Account—Oats and 1959-60 Pool Account—Barley, and approved:

1959-60 Pool Account—Barley

1959-60 Pool Account—Wheat

Auditor's Report and Statements of Operations of The Canadian Wheat Board on Wheat, Oats and Barley.

The Supplementary Report of the Canadian Wheat Board was approved.

The Chairman thanked the officials of the Canadian Wheat Board for their appearance.

At 11.00 a.m. the Committee adjourned to the call of the Chair.

TUESDAY, July 4, 1961.

(39)

The Standing Committee on Agriculture and Colonization met, *in camera*, at 10.05 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Badanai, Boulanger, Danforth, Doucett, Forbes, Forgie, Hicks, Knowles, Lahaye, McBain, McIntosh, Milligan Nasserden, Noble, Pascoe, Peters, Rogers, Southam, Stefanson, Thomas, Tucker.—(21).

The Committee considered and approved a draft report to the House on the Annual Reports of the Canadian Wheat Board and the Board of Grain Commissioners for Canada for presentation to the House as the Committee's Second Report.

At 10.10 a.m. the Committee adjourned to the call of the Chair.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

MONDAY, June 26, 1961.

The CHAIRMAN: Gentlemen, you will kindly come to order. This morning the standing committee on agriculture and colonization welcomes as witnesses the Canadian wheat board. Sitting next to me on my right, is Mr. W. C. McNamara, the chief commissioner. At this time I shall call on Mr. McNamara to introduce the other members of his board.

Mr. W. C. McNAMARA (*Chief Commissioner of the Canadian Wheat Board*): Mr. Chairman and gentlemen, once again it is the privilege of the Canadian wheat board to have this opportunity to meet with the members of the agricultural committee, and to discuss our reports, which have been tabled before you. Our full board is present today. To my right is Mr. William Riddel, the assistant chief commissioner, and Mr. W. E. Robertson, commissioner of the board. Then we have our comptroller-secretary, Mr. C. E. G. Earl, our solicitor, Mr. H. B. Monk, Q.C., and Mr. C. B. Davidson, executive assistant to the board.

We hope we have all the information the committee will require, but if we have not, we will arrange to get it. We are at the service of the committee. In the past it has been the practice for us to have our secretary read the report part by part, paragraph by paragraph, and we are prepared to do so if it is the wish of the committee. But if you would prefer not to have the report read, we will discuss it part by part, and do whatever the committee desires. We are quite willing to go along with you.

The CHAIRMAN: You have heard Mr. McNamara's suggestion. Do you wish the report to be read paragraph by paragraph?

Mr. HORNER (*Acadia*): Yes, I think that has always been the practice.

The CHAIRMAN: It would appear that it is the general wish of the committee that the report be read, paragraph by paragraph. Perhaps Mr. Earl would now proceed to do so.

Mr. C. E. G. EARL (*Comptroller-Secretary of the Canadian Wheat Board*): I shall now read paragraph number 1.

Mr. McNAMARA: I might say that this is the regular report, not the supplementary.

Mr. EARL:

1. General Comment—Crop Year 1959-60

World wheat production in 1959 was somewhat smaller than the record production of 1958. The major part of the reduction occurred in the United States and in the U.S.S.R., both countries having harvested unusually large wheat crops in the previous year. Wheat production in the United States was estimated at 1,128 million bushels as compared with 1,462 million bushels in 1958. Wheat production in the U.S.S.R. was unofficially estimated at 1,900 million bushels as compared with 2,300 million bushels in 1958. Production in Canada was moderately larger in 1959, while Argentina and Australia harvested smaller wheat crops. In Western Europe total wheat production was estimated at a record 1,410 million bushels as compared with 1,345 million bushels in 1958.

The outturn of wheat crops in Western Europe was due to favourable weather conditions during the growing season, followed by dry harvesting weather. Wheat of exceptional quality was harvested. The volume of production and quality were such as to reduce import requirements, particularly on the part of the United Kingdom and the Federal Republic of Germany. France harvested a large wheat crop of 425 million bushels which produced a substantial exportable surplus in 1959-60. Italy was the exception to the general pattern of bountiful production, harvesting a much smaller wheat crop than in the previous year.

Wheat production in Eastern Europe (excluding the U.S.S.R.) was generally higher than in 1958, with greatly improved production in Rumania and Yugoslavia.

Production in Asia, apart from the Middle East, was fully maintained. Crop losses were sustained in Lebanon, Syria, Turkey and Iraq.

Wheat production in Africa was slightly higher in 1959, reflecting, in part, improved production in the Union of South Africa.

International trade in wheat, including non-commercial distribution, was estimated at 1,321 million bushels; slightly larger than in the previous crop year. Shipments of the major exporting countries were as follows:¹

	1959-60	1958-59
	(million bushels)	
Canada	278	295
United States	512	443
Australia	122	75
Argentina	77	103
U.S.S.R. (est.)	180	220
France	65	39

The decline in Canadian exports reflected, in part, the smaller import requirements of Western Europe.

The increase in the United States exports was due entirely to a larger distribution of wheat under disposal programmes. The division of United States exports between disposal programmes and commercial sales is shown as follows:

	1959-60	1958-59
	(million bushels)	
Disposal programmes	373	302
Commercial sales	139	141

Reflecting an increased demand for soft wheats, Australian exports increased sharply in 1959-60. Exports from Argentina reflected reduced production in the crop year under review.

Exports from the U.S.S.R. were estimated at 180 million bushels, a reduction from the previous crop year. The bulk of exports from the U.S.S.R. went to Communist countries; about 28 million bushels were disposed of in Western Europe, principally in Finland, The Netherlands, the United Kingdom and Norway.

France exported 65 million bushels of wheat as compared with 39 million bushels in the previous crop year. These exports were about equally divided between Western Europe and Africa.

¹ Canada, August-July; others, July-June.

The CHAIRMAN: Are there any questions or general comments on paragraph 1?

Mr. HORNER (*Acadia*): There is a great deal of talk about the disposal program in the United States. I see that in 1959-60 they increased it. Are they continuing to increase it in 1960-61?

Mr. McNAMARA: Yes. The estimated export of American wheat in this current crop year—we seem to get out of 1959-60 very rapidly, and I am talking about 1960-61—their export is estimated to be 660 million bushels. This is a record, and it is estimated that there will be a substantial increase, particularly under this special program.

Mr. RAPP: How do the Russians or the U.S.S.R. do it? Are they stronger in that market now than they were in 1959-60?

Mr. McNAMARA: No, I think when we get the final figures on the Russians this year, they will show that their total movement out of Russia will be away below the movement last year. But the Russians are still expected to export mainly to the European market.

Mr. KORCHINSKI: How much of that American disposal was give-away as opposed to sales?

Mr. McNAMARA: We deal with that matter further on in the report, where we give the figures in some detail, commencing at page 8.

Mr. PASCOE: Mr. Chairman, on page 1, it says "reflecting an increased demand for soft wheats"; I wonder if Mr. McNamara could give us the reason for an increased demand, and whether or not it is continuing into the present crop year.

Mr. McNAMARA: Crop conditions in certain areas of the world such as the Middle East, where quality is not the factor that it is in some of the commercial markets, like the United Kingdom, Germany and Japan but in countries like Italy, and some of the middle eastern countries where the quality of the indigenous wheat, the soft wheat is of low quality, appear to have the result of heavy importations into those areas. If they were not prepared to pay for premium wheat, quality wheat, they would increase their purchase of lower quality.

Mr. PASCOE: Is there a tendency or a greater demand for soft wheat as against our hard wheat?

Mr. McNAMARA: No. It is due to climatic conditions, I think.

Mr. MUIR (*Lisgar*): Do you feel that the American disposal program for 1960-61 will have very much of an adverse affect on our sales?

Mr. McNAMARA: No. Generally speaking it is being handled in non-commercial areas; their distribution to India, and Pakistan is very heavy. But these are not commercial markets at the present time. They do not have the currency to pay for the grain, so their competition has not come into the commercial markets, and it has not been unfair competition.

Mr. HORNER (*Acadia*): I take it from the first paragraph that our exports were down in 1959-60 because of the record crops or good crops in Europe and central Europe. Would that be correct?

Mr. McNAMARA: That is correct.

Mr. BOULANGER: Where does Russia sell her wheat? Do they sell it in the United Kingdom?

Mr. McNAMARA: They sell only limited quantities to the United Kingdom. However they will be selling a substantial quantity to Holland, which is a market which used to use our number five wheat. But now since we are out of supply of number five, the Russians have moved in there fairly heavily, and

they have also made some inroads in the Belgian market. Generally speaking, most of their wheat goes to eastern European countries. They did barter some wheat in 1959-60 on the basis of exchange for cotton.

Mr. BOULANGER: We cannot compete with that?

Mr. McNAMARA: We have the same quality of wheat, and they produce some wheat which is equal to ours; but their system of distribution, grading, and inspection is not as stable as ours. Therefore in the quality markets Russian wheat does not have the reputation of Canadian wheat. And in their pricing policy, the Russians are obviously watching our present policy very closely and they are selling their wheat at a discount under our wheat. So there is this factor of the discount along with the question of quality which must be taken into consideration.

Mr. FORBES: Would you care to comment on the increased exports from France? Where do they go?

Mr. McNAMARA: The French situation has changed in recent years. They have a very high support price for their domestic production, and it has been increased. But they are producing a very low quality of what we call a soft type of wheat. Most of it is being exported and used for feeding purposes within Europe. Very little of it is used for milling, except within France itself. It is mostly wheat which is bought for feeding markets of the world, although some French flour companies are beginning to get into the flour markets of the world.

Mr. FORBES: It would not affect our markets?

Mr. McNAMARA: No, not a great deal; but in the common market France will be pressing to have her partners use more of her French wheat. We do not anticipate that this will adversely affect Canadian sales to any large extent. But it will probably have some effect on the exports to Germany, Belgium, and Holland, under their provisions of the common market, when they agree to accept French wheat. At the present time these countries use Canadian wheat to build up their indigenous wheat, and they may turn to the use of more French wheat. It is not a type of wheat that their people like. It is of a lower standard. But we hope that the result of the common market will not seriously affect the importation of Canadian wheat into the commercial markets of Europe. I believe last year we made a guesstimate that it could probably have affected our commercial sales to Europe to the extent of ten or fifteen per cent.

The CHAIRMAN: Mr. Southam.

Mr. SOUTHAM: My question is similar to that of Mr. Forbes in respect of France disposing of her exportable surplus, and has been very adequately answered by Mr. McNamara.

Mr. ROGERS: I would like to ask what position the United States is in now. Has she been able to reduce her surplus of wheat?

Mr. McNAMARA: No. Notwithstanding their very heavy exports this year, I think their carry-over at the end of this crop year will be the largest in history. Also they have another very large crop in sight.

Mr. HORNER (*Acadia*): With regard to the common market and the inner six, do you know whether or not it is planned to put up a barrier against Canadian agricultural products, particularly wheat, coming into the inner six.

Mr. McNAMARA: No; I do not believe so. I do not know about other agricultural products; but not in respect of wheat. Mr. Riddel points out that it is really not a barrier, but that all these countries put sort of a tax on our wheat. They buy it at our price, but resell to the commercial outlets within their own countries and levy a tax against it—a skimming fee they call it.

Mr. HORNER (*Acadia*): Is it planned to increase this?

Mr. McNAMARA: It will depend on the level of the price eventually guaranteed to the producers within these countries. They will bring it up to that level.

The CHAIRMAN: Are there any further questions under the heading general comment?

We will proceed to crop development and supplies.

Mr. EARL:

2. Crop Developments and Supplies

The following table shows acreages seeded to grains and flaxseed in the prairie provinces in 1959, along with comparative statistics for 1958:

	1959 Acreage	1958 Acreage
	(thousand acres)	
Wheat	22,557	20,244
Oats	7,882	7,584
Barley	8,107	9,369
Rye	435	419
Flaxseed	2,130	2,602
TOTAL	41,111	40,218

Wheat acreage in the prairie provinces increased from 20.2 million acres in 1958 to 22.6 million acres in 1959. A moderate increase occurred in the acreage seeded to oats, while a relatively sharp decline occurred in barley and flaxseed acreages.

The seeding of the 1959 grain crops in the prairie provinces was delayed by cool, unsettled weather and some soil drifting in the early part of the season. However, by the end of May seeding had been practically completed. Moisture supplies ranged from poor to fair during seeding time in most districts. The Dominion Bureau of Statistics made some significant comments upon the 1959 growing season which are quoted as follows:

Moisture supplies were limited during most of June over most of the prairie provinces and crops had reached a critical point over large areas of southern, central and west-central Saskatchewan and parts of Alberta where heavy rainfalls occurred late in the month. These rains were quite general and most crops responded well to the improved conditions, although some early-sown fields, especially stubble fields, had deteriorated too greatly to derive much benefit. Reflecting the heavy rains during the last week in June, average growing season precipitation for Saskatchewan increased from 39 per cent below to 1 per cent above normal. In Alberta, the increase was from 16 per cent below to 4 per cent above normal. In Manitoba, where the moisture situation was much better than in the other two provinces, the average growing season rainfall increased from 5 per cent above to 12 per cent above normal.

At mid-July crops were making good growth but by the end of the month high temperatures were rapidly advancing maturity. Continued hot, dry weather in Manitoba, Saskatchewan and many parts of Alberta had ripened much of the crop prematurely by mid-August. During the latter half of August, however, wet, unsettled weather was retarding maturity of late-sown fields and delayed harvesting operations. September brought little or no improvement, with harvesting still hampered by wet weather. By the end of September most of the cereal crop acreage was threshed in Manitoba, but only about 50 per cent of the flax was harvested. In Saskatchewan, about 25 per cent of the cereal crops and 75 per cent of the flax remained to be threshed.

With the exception of flaxseed, the greater part of the unthreshed crops was in the east-central and northern areas. Except for the southeast corner of the province, harvesting progress throughout Alberta had been seriously delayed by dull, damp weather and about 60 per cent of the cereal grains and 75 per cent of the flaxseed remained in the fields in late September. By mid-October heavy snows had fallen over wide areas of the prairie provinces, leaving substantial quantities of all grains still in the fields.

The early maturing grain crops in the southern half of the prairie provinces were generally harvested without excessive moisture content, even though harvesting operations were subject to many interruptions and delays. The delay in harvesting operations was most pronounced in central and northern Alberta, in northerly and easterly areas of Saskatchewan and in some areas of northern and eastern Manitoba.

As at November 1st, the Dominion Bureau of Statistics estimated that some 250 million bushels of grain still remained to be harvested. This estimate was probably somewhat high but it did indicate the extent of the harvesting problem at that date. In November, and well into December, harvesting went on periodically in central and northern sections of Saskatchewan, but only to a limited extent in Manitoba. As at December 31st, the Dominion Bureau of Statistics estimated that 111 million bushels of grain still remained to be harvested. This meant that a substantial quantity of grain was harvested in November and December, and most of this grain was threshed as tough and damp. The grain which remained in the fields during the winter was harvested by early May, and in most areas a satisfactory recovery was reported in spite of losses in yield and grade.

The following table shows production in the prairie provinces in 1959, along with comparative statistics for 1958:

	1959	1958
	(thousand bushels)	
Wheat	399,000	346,000
Oats	263,000	240,000
Barley	219,000	238,000
Rye	6,360	5,400
Flaxseed	17,500	22,500
TOTAL	904,860	851,900

In spite of the hazards of the growing season and the unfavourable harvest, production of grains and flaxseed in the prairie provinces in 1959 showed a moderate increase over the previous year. Wheat production was estimated at 399 million bushels as compared with 346 million bushels in 1958. Oats production increased from 240 million bushels to 263 million bushels, reflecting an increased acreage.

Barley production declined from 238 million bushels in 1958 to 219 million bushels in 1959. Due largely to the unfavourable harvest and reduced acreage, flaxseed production was 17.5 million bushels as compared with 22.5 million bushels in 1958.

The following table shows the inward commercial carryover of wheat, oats and barley in Canada as at August 1, 1959, with comparable figures for the corresponding date of previous years:

	August 1 1959	August 1 1958	August 1 1957
	(million bushels)		
Wheat	419.0	407.6	410.4
Oats	39.0	46.9	54.1
Barley	71.1	60.7	61.8

The following table shows farm stocks of wheat, oats and barley in the prairie provinces as at August 1, 1959, along with comparative estimates for previous years. These stocks include farm requirements in the form of seed and feed, as well as deliverable surpluses.

	August 1 1959	August 1 1958	August 1 1957
	(million bushels)		
Wheat	126	229	319
Oats	53	88	155
Barley	54	55	79

The CHAIRMAN: Are there any questions on this?

Mr. HICKS: I would like to ask the witness for his ideas about the future of flax production. We know that many livestock men have fed oilcake meal or flaxseed meal for years. Now, in the real west, it seems almost impossible to buy it. What is the future of it? There is competition from the soybean meal coming in from the United States.

Mr. McNAMARA: This is a question which should be directed to someone who is more of an agricultural expert than I. I understand that production of flax in the west is rather hazardous, although there has been some increase in recent years and a good market for flaxseed. I understand that this year flax has been reduced because of the dry weather conditions and it is very doubtful if the yield will be satisfactory. There is a market at the present time for flax and linseed as well as rapeseed; but that the trend will be in western Canada this year, in so far as production of flaxseed is concerned, is something which is not within my competence to answer. I am not an expert along these lines. I think that many members of the committee would know more about the production of flax than I do.

Mr. HICKS: I understand that the oil is not being used for paint now as much as it was. I assume that will affect the demand.

Mr. McNAMARA: It might in Canada, but the export demand is still quite strong. We have some statistics at the back of the report which will give some indication of the acreage and the trend of production in western Canada.

Mr. HORNER (*Acadia*): These tables show the stocks held on the farms. I notice that at August 1, 1957, 1958 and 1959, there has been a continued reduction of farm held stocks, particularly in respect of wheat. Is it your view that as at August 1, 1961, there will be less than what is shown here for 1959?

Mr. McNAMARA: I anticipate there will be a slight reduction. You must remember that this last crop was a fairly large one. I believe it is estimated at around 475 million bushels. Notwithstanding the slightly heavier exports we are engineering this year and the domestic consumption, we will be fortunate if we can reduce the farm carry-over to any extent. Another factor, I think, is the outlook for the current crop. Last year producers were inclined to deliver,

in the last part of the crop year, all the grain they could possibly find space for. I would anticipate, if present weather conditions prevail, that in western Canada many producers will keep some stocks on their farms. I hope this will be the case, because I think it would be a wise policy to follow.

Mr. HORNER (*Acadia*): In respect of oats, I think last winter, particularly in Alberta, a great deal of oats was fed. I would think there is less oats on hand than perhaps in previous years.

Mr. McNAMARA: Yes, although the elevator agents in their last estimate of the delivery availability of oats indicated there were still thirty million bushels of oats in the hands of the producers which they would desire to market. We have a special supplementary quota on oats. Our oats deliveries have been considerably higher this year than last year. As of June 14, we have taken thirty-two million bushels of oats as compared to 16.5 million last year. The total for the last crop year was twenty-four million bushels. So, we are taking larger quantities of oats off the farms. I am inclined to agree with Mr. Horner that if this condition of drought that we now are experiencing in western Canada continues, there is going to be a serious shortage of feeding grains in certain areas, with the result that I think that the delivery potential to the board will be considerably decreased to that of the agents' original estimates.

Mr. PASCOE: I have a supplementary in connection with your remarks about hoping that the farmers would keep some of their grains on the farms. Would that indicate that the wheat board is not going to push sales as hard as they can?

Mr. McNAMARA: We still are carrying in commercial positions large volumes. We will have a carry-over at the end of July in the amount of 500 million bushels. We will continue to push sales as hard as we can.

Mr. PASCOE: What do you consider normal carry-over?

Mr. McNAMARA: When the Temporary Wheat Reserves Act was passed, the government considered 178 million bushels of wheat in commercial position was a normal carry-over, and of course ever since, we have been carrying over substantially larger amounts than that. I think 178 million bushels would be too low under the conditions which prevail today. I would rather see a carry-over in commercial position of around 300 million bushels, and I would consider that more normal than 178 million bushels.

Mr. SOUTHAM: Mr. Chairman, in dealing with the 1959-60 crop year with respect to the heavy moisture content, did this have any effect on the overall marketing by the Canadian wheat board, as far as world markets were concerned?

Mr. McNAMARA: It created the problem of drying the grain. We had to dry and condition large volumes of tough and damp grain in our terminals. It did disrupt our quota system for a considerable period because we had to preference the movement of this grain. It did affect our shipments out of Vancouver during the winter months, because the grain that was moved to the west coast had to be dried at the terminals there, as a result of which this slowed down our delivery potential.

Mr. SOUTHAM: Did that have the result of decreasing the potential sales for that crop year, or delaying it?

Mr. McNAMARA: It is hard to put a figure on it. It certainly delayed them, and it may have decreased them slightly. Let us say that it did not improve the situation in any way.

Mr. KORCHINSKI: Have we disposed of most of that poor quality grain that was under the snow that year, or have we still some on hand? Primarily, where were our customers—in Canada, or elsewhere?

Mr. McNAMARA: Most of the grain under the snow when threshed, and after it was dried, graded No. 3 or No. 4 Northern, and it was sold along with other stocks of this grade in world markets. It was still all commercial grade.

Mr. KORCHINSKI: Was not a lot of it No. 5? I know mine was No. 5.

Mr. McNAMARA: Some was, but there has been a good market for No. 5 wheat within the domestic market and for export.

Mr. KORCHINSKI: Was the majority of it No. 3 and No. 4.

Mr. McNAMARA: Yes, I think the majority of it would be No. 4.

Mr. MUIR (*Lisgar*): What size of stocks of oats are you carrying in commercial position?

Mr. McNAMARA: As of June 14th, we are carrying in commercial position 20,980,000 bushels of oats—approximately 21 million bushels,—and as at June 15th last year, we were carrying 18 million bushels.

Mr. MUIR (*Lisgar*): What are your principal export outlets for oats? Is it the States?

Mr. McNAMARA: There has been a very limited market. The States have been our traditional outlet, but there have been no large volume movements. A few oats have been going overseas, but a very limited quantity.

Mr. MUIR (*Lisgar*): In other words, the bulk of the oats is being used at home?

Mr. NASSERDEN: Has there been any demand in eastern Canada for oats which you were unable to fill?

Mr. McNAMARA: We are intending to deal with this question fully. Would you like to discuss this eastern situation now, as related to this crop year, or 1959-60?

Mr. NASSERDEN: I will leave it up to you.

Mr. McNAMARA: We refer to this, and I will be prepared to deal with it in our supplementary report.

The CHAIRMAN: We had better leave it.

Mr. RAPP: Under table No. 2, it shows the acreage seeded on the prairies. Would it not give us a fuller picture if all the grains that are seeded on the prairies were listed under this item?

Mr. McNAMARA: You will find it in these tables at the back. We do list all these.

Mr. RAPP: I have not looked that far ahead.

The CHAIRMAN: Are there any further questions, gentlemen? If not, is it agreed that "crop development and supplies" be passed?

Some Hon. MEMBERS: Agreed.

Mr. EARL:

3. Legislation

There were no amendments to the Canadian Wheat Board Act during 1959-60. Parliament, however, passed two Acts which were related to the marketing of western grain. These were the Prairie Grain Provisional Payments Act and the Prairie Grain Loans Act.

The Prairie Grain Provisional Payments Act was enacted in January, 1960, and was proclaimed on February 1, 1960. The purpose of this Act was to provide for provisional payments in respect of unthreshed grain in the prairies provinces for the 1959-60 crop year pending the threshing of such grain and the delivery thereof to The Canadian Wheat Board. Section 6 of the Act sets forth the basis of provisional payments and is quoted as follows:

"Section 6—

- (1) Subject to this section, the amount of a provisional payment to a producer shall be one-half of the unthreshed grain, irrespective of its grade, that the applicant has and undertakes to deliver to the Board, multiplied by
 - (a) fifty cents per bushel in the case of wheat,
 - (b) twenty cents per bushel in the case of oats, and
 - (c) thirty-five cents per bushel in the case of barley.
- (2) The quantity of unthreshed grain in respect of which a provisional payment may be made to a producer shall not exceed the quantity of grain that would be deliverable under the applicant's permit book for the 1959-60 crop year on a quota of six bushels per specified acre, minus the total of
 - (a) the quantity of grain delivered by him to the Board prior to his application and during the 1959-60 crop year, and
 - (b) any threshed grain that the applicant has in storage otherwise than in an elevator.
- (3) A provisional payment to a producer shall not exceed fifteen hundred dollars.
- (4) The aggregate of a provisional payment to a producer and the advance payments made to him in respect of the 1959-60 crop year under the Prairie Grain Advance Payments Act shall not exceed three thousand dollars."

The Act also prescribed procedures to be followed in the issuance of provisional payments and the repayment thereof. Provisional payments were interest-free to producers unless declared to be in default.

Pursuant to the Act the Board entered into an agreement with elevator companies to act as agents of the Board for the purpose of making provisional payments and receiving repayments. The operations of the Board in respect of the Prairie Grain Provisional Payments Act are dealt with in Parts II and V of this report.

The Prairie Grain Loans Act facilitated loans to producers in the designated area against the security of grain on the farm, whether harvested or otherwise. Under the provisions of this Act the lending banks were given certain guarantees in respect to the repayment of such loans.

The CHAIRMAN: Are there any questions?

Mr. HORNER (*Acadia*): I have just one quick question. There is no mention made about the regulation of feed mills here. Would that come under this item?

Mr. McNAMARA: I think we deal with it later on. That was not legislation.

Mr. HORNER (*Acadia*): I understand; it was a matter of regulation.

Mr. McNAMARA: Yes that is right.

Mr. KORCHINSKI: Have repayments been made of all these loans, and if not, what amount has not been recovered?

Mr. McNAMARA: I think we have the figures here.

Mr. KORCHINSKI: You might give me at the same time the total amount of the loans made.

Mr. McNAMARA: Yes, I think we have it.

Mr. EARL: We can get that for you. It is the Provisional Payments Act that you want, not the advances. That is a statement I will have to get for you later.

Mr. KORCHINSKI: Yes; and at the same time would you please get for me the number of farmers who took these loans?

Mr. EARL: Very well.

Mr. MUIR (*Lisgar*): Are they loans, or advances?

Mr. KORCHINSKI: They are advances, really.

The CHAIRMAN: Are there any further questions? If not, paragraph 3 "legislation" is agreed to. Now, let us turn to paragraph 4 "transportation".

Mr. EARL:

4. Transportation

The following table shows primary receipts from producers and principal movements of western grains in 1959-60 as compared with 1958-59:

	1959-60	1958-59
	(million bushels)	
Primary receipts from producers	517	552
Shipments from country elevators and platform loadings	525	524
Receipts at Pacific coast ports	137	155
Receipts at Fort William/Port Arthur	300	288
Shipments from Fort William/Port Arthur (lake and rail)	295	294

The crop year 1959-60 was characterized by a reduction in the volume of grain delivered by producers and a reduction in receipts of grain at Pacific coast ports. All other movements remained at about the same levels as in 1958-59. During the crop year producers' deliveries corresponded very closely to the elevator space created through domestic utilization of commercial grain supplies and exports. Domestic utilization remained at the level of the previous crop year, but exports of grains and flaxseed amounted to 357 million bushels, a reduction of 26 million bushels from the quantities exported in 1958-59. Adequate transportation was provided by the railways and lake vessel operators for the grain movement. At times, and particularly toward the end of the crop year, railway carloadings were limited by the volume of unload space available at terminal points.

ALLOCATION OF SHIPPING ORDERS

From August 1, 1959 the board operated under a new instruction from the Minister of Trade and Commerce with respect to the allocation of board shipping orders among elevator companies. Under date of July 30, 1959 the board stated the principles and the details of its new policy in respect to the allocation of shipping orders. In general terms, the new policy provided for:

- (1) The right of elevator agents to apply to their railway agents for out-of-order cars when their elevator is congested and unable to receive grain of kinds or grades generally offered by producers. Rules were established for the definition of congested elevators, and for the subsequent application of resultant shipments against the congested elevator provision or other shipping orders.
- (2) The board continued to allocate shipping orders to the head offices of elevator companies for distribution to their elevator agents. The percentage distribution to each elevator company was revised from time to time on the basis of each company's total receipts of wheat, oats, barley, rye and flaxseed from producers.

During the crop year elevator agents received 28,579 cars pursuant to the congested elevator provision. Of these cars, 13,719 were applied against current shipping orders available to local elevator agents.

The instruction of the Minister of Trade and Commerce provided for a review of the policy subsequent to July 31, 1960. After careful consideration, and on the recommendation of the board, the policy was continued for the crop year 1960-61 without amendment.

Mr. MANDZIUK: Going back to this allocation of shipping orders, I have a perennial problem relating to a number of points north of Brandon in my constituency, and particularly in Foxwarren. Probably Mr. McNamara is well aware of the fact that the Manitoba pool elevators are always complaining, and they have grounds for complaint, that they do not get enough shipping orders, and this congests their elevators while the line elevators still have space. This means that in order to deliver their quotas they are obliged to deliver their grain to the line elevators. What remedy is there for that situation? I had the same complaint in 1959 and I also had it in 1960.

I do not want to take up the time of the committee by reading a letter I received about the 1959 situation. I can give the letter to the board, but I ask what is the solution for the problem?

The impression created, and mind you it may be a wrong one, is that it is the terminal elevators of the pool which do not get shipping orders in proportion to the volume of grain they handle, and consequently there is congestion at the Lakehead. I wonder is this a common complaint or is it unique in my area?

Mr. McNAMARA: No, it is a complaint that develops in certain areas from time to time. Most of these complaints originate from farmer-owned elevator companies; but in general, in pursuance of the new policy instituted as a result of the Bracken commission, the elevator agent has the right, when his elevator is congested, to order a car and get a priority on it from the railway companies. That has gone a long way to ease the situation. I shall not say this has completely corrected the problem, but the complaints which the board received during the crop year from the producers were considerably less than before this policy was put into effect. However, we do run into difficulties, particularly towards the end of the crop year.

I have in mind a station in Saskatchewan where, due to availability of stocks of certain grades that have to be shipped to meet market requirements, and where the space in the particular market could accommodate a full seven bushel quota, then the elevator agents have the right to secure cars from the railways without reference to us, in order to relieve this congestion. However, if the seven bushel quota is full, we have asked the railways to transfer their shipments into stations where there are four, five or six bushel quotas. As a result of this, some of the companies are complaining they cannot use their own facilities because the railways have told them to put the cars into low quota points. This is correct, and when we get towards the end of the crop year this congested elevator policy is not as effective as it is during the crop year.

There are other problems related to the handling of grain. There is the situation at the Lakehead and the inability of the various companies to handle the grain themselves. Also there is an embargo placed on shipments for a period of time; but I see there are representatives of the farm organizations in attendance, and perhaps later at this meeting some of them will be dealing with problems relating to the policy being followed by the Canadian wheat board. In conclusion, I repeat that the policy inaugurated as a result of the Bracken commission has gone a long way to ease the situation, and there is less dissatisfaction now than there was prior to the adoption of that policy.

Mr. MANDZIUK: That is quite all right, but what governs orders at the terminals? It is not the wheat board?

Mr. McNAMARA: You mean the allocation of boats?

Mr. MANDZIUK: Yes. I understand there is a certain discrimination. The pool terminals do not get the boats they are entitled to in proportion to the business they are doing, and in a lot of cases they are doing more than 50 per cent of the business.

Mr. McNAMARA: The boats are allocated by the lake shippers' organization. We do not allocate the boats ourselves, but that organization takes into consideration the various factors, and I think the association is handling this distribution of boats quite equitably. The various companies seem to be getting their share under the formula adopted by the organization, but the question the pool organizations are raising is to see whether a formula could be devised whereby the amount of business they originate to the country could be used as the basis upon which boats are allocated to them.

Mr. MANDZIUK: Do you not think their request is quite reasonable?

Mr. McNAMARA: I would not go so far as to say that. This is something that even the Bracken commission did not recommend. Generally speaking, I think there are arguments on both sides of the question. The terminals are performing the service at the Lakehead and it is correct that the pools have expanded their facilities in recent years. I think this is the way the problem should eventually be solved, that an organization which is originating business in the country should have terminal capacity to handle the percentage of grain it is originating into the terminals. Mind you, I am not criticizing the pools in this regard because statistics indicate they have been following the policy by considerably increasing their facilities, and the balance is much more in relation to the volume of business they are originating than it was a few years ago.

Mr. MANDZIUK: Is this organization for allocating the boats an organization of the various grain dealing companies and does it include the pools?

Mr. McNAMARA: That is right. They are all members of it.

Mr. MANDZIUK: Have you any control over that association?

Mr. McNAMARA: We have never exercised any control, but it has been argued that under the provisions of the act we could.

Mr. MANDZIUK: That is what I thought.

Mr. McNAMARA: But, we have always refrained from doing so and I doubt very much the wisdom of our exercising control to the extent that it would mean we would take over the operations of the terminals.

Mr. MANDZIUK: While we are on this point, I should mention I have just received a letter from Brookdale, in my constituency. They say they have got orders for 40 cars of grain but, between now and the end of the year, due to the train service they get all they will receive will be 25 cars. How can that problem be solved?

Mr. McNAMARA: By the railway putting a better train service in there. This is always a problem on some of the branch lines towards the end of the crop year but, generally speaking, the railways are doing a terrific job of railroading for us. I am quite confident that by the end of the crop year we shall be able to equalize at least all six bushel quotas throughout the west and I am hoping, pending developments within the next few weeks, we shall do better than that.

Mr. MANDZIUK: Talking about the Foxwarren situation in 1959, this Manitoba pool elevator which was congested had to deliver its grain to line elevators on August 3, and yet two days after August 1, it received 12 cars. Now, if these twelve cars were available to load the grain at that time, why did they not come in before August 1?

Mr. McNAMARA: This is a problem of railroading. Undoubtedly the railway attempted to equalize in that particular situation.

Mr. MANDZIUK: You know how these people felt about that?

Mr. McNAMARA: I can appreciate their disappointment.

Mr. MANDZIUK: I believe the same situation is going to develop before the end of July this year, and I shall be 'phoning you or your solicitor, my former classmate.

Mr. PASCOE: Mr. McNamara has explained this pretty well, but he talks here about the distribution of shipping orders, and he indicates there is a revision of the policy in that connection from time to time. Could he indicate how often it is reviewed, and what factors are taken into consideration?

Mr. McNAMARA: It is revised every month. When this policy was inaugurated we started off allocating orders on the basis of the percentage of business each company had been securing from the procedures as at that time and then, when we went into September, we took 11 months of the actual business which the companies had secured, so that at the end of the first crop year the allocations were based on the actual percentage of business each company had originated during the previous year.

Mr. PASCOE: I understand that shipping orders go direct to the head offices of the companies?

Mr. McNAMARA: Yes. It is the responsibility of management to allocate the orders, and we control this in order to make sure enough is sent to the low quota points. Management decides which amount of the orders shall go to the individual points, subject only to the control we exercise. If we need 25 cars at a station to bring it up to a six bushel level, and there are four companies in that market, then we make sure we will not end up getting only 20 cars.

Mr. PASCOE: You state that the elevator agents have the right to apply to railway agents for cars when their elevators are congested. Now, at some small points where the railway agents have been removed, how do you arrange for the allocation of cars?

Mr. McNAMARA: I think the travelling superintendents and divisional superintendents could deal with the people responsible for the distribution of cars at these sidings.

Mr. PASCOE: I have just one more point. You state that domestic utilization of wheat remained at the level of the previous crop year. Is the domestic utilization not being increased due to the growth in population?

Mr. McNAMARA: So far as human consumption is concerned, diet is a factor. Also, in so far as the utilization of wheat for feeding is concerned, the limited availability of low capacity wheat is a factor. When we had large volumes of number six wheat, and even frosted number five wheat, there was a tendency for a certain proportion of it to be consumed in Canada, and the present low percentage of these low grades has affected consumption.

Mr. PASCOE: You think diet is a factor?

Mr. McNAMARA: It is not the only factor. When the standard of living of any country goes up there is a tendency for more meat and proteins to be used, as compared with the newer, developing countries which are just getting into bread consumption.

Mr. SOUTHAM: Possibly this is an isolated case so far as transportation is concerned. I have had several complaints regarding the C. N. branch line which runs down to my area in southeastern Saskatchewan and comes out at North Gate. Year after year we find shipments of American goods going down there, but there are complaints that the staff on the railway line are a little reluctant to stop and put off cars, and sometimes they will leave an elevator waiting for a long time for cars. Is that an isolated complaint?

Mr. McNAMARA: I think it is rather isolated. I have heard this story. In my own experience in the elevator business we used to run into problems of this kind, but generally they were corrected. It is a temporary situation. Both railways are making outstanding efforts to place cars where they are needed, and to equalize the quotas. I am satisfied that they will be able to do this at least to the six bushel figure prior to the end of July, and possibly even better than that.

Mr. SOUTHAM: They used to run down to the United States, and to put these men on more than their regular hours of run. This appeared to be a rather isolated complaint, and I just thought I would draw it to your attention.

Mr. McNAMARA: I think it is rather isolated, such as in cases where it is going into Yorkton, or some places where the crew is going right through and heading for home.

Mr. SOUTHAM: In your experience, due to the fact that the St. Lawrence seaway has been operating for some time, do you think it is helping to expedite the movement of grain to any appreciable extent, so far as the shipment to eastern ports is concerned?

Mr. McNAMARA: Yes, I would say that it was of benefit to Canada particularly in the movement of grain; but as a result our larger shipments out of Vancouver, the St. Lawrence is not what it has been previously. The St. Lawrence seaway has been very beneficial to the movement of American grain as well. American grain movement has benefited to a greater extent than the movement of Canadian grain.

Mr. SOUTHAM: Do you think that the St. Lawrence seaway in giving us these extra facilities, has given us an advantage, market-wise?

Mr. McNAMARA: I think the Americans are probably getting more of an advantage. We have always had the benefit of a water route, even though it was not direct and we had to ship via the directions of the transport board. But the St. Lawrence seaway has opened up for the Americans a new outlet which they did not enjoy previously to any degree.

Mr. NASSERDEN: Delivery quotas have been brought up. I have received a number of telegrams within the last few days, where they have 60 to 65 orders, and where they have not been receiving the cars. In some cases they have not received cars for three weeks. What is the situation there?

Mr. McNAMARA: We have orders in the hands of elevator agents to provide for better than the full six bushel quota. The railways are working on these orders, and shipments have been running from 1,500 to 1,600 cars a day. There has been excellent movement, and we have a larger number of orders than usual in the hands of the agents. Naturally we are not getting them all cleaned up at the same time, but generally speaking there has been movement at a much higher level than it has been for years. I refer to the present time.

Mr. FORBES: Is there sufficient terminal space to hold a six bushel quota?

Mr. McNAMARA: Yes. One of the problems we are worrying about is this: we have sold quite a volume out of the St. Lawrence but some of the boats are not arriving on schedule. So we are tightening up a bit in the St. Lawrence. If the situation can be relieved, it will be only a matter of a few days, if these boats can get into Montreal and St. Lawrence ports. However there is a possibility that the lakehead position will tighten up temporarily between now and the end of July. But as shipments are resumed, there is bound to be space in August. Nevertheless we do have some concern as to what the situation at the lakehead may be within the new few weeks if these boats do not "present" in the St. Lawrence to take delivery of this grain.

Mr. KORCHINSKI: Is Churchill filled to capacity?

Mr. McNAMARA: Yes. We fill it up in the fall, and we have orders going out in the next few weeks; it will be about the 15th of July.

Mr. KORCHINSKI: Have you any idea when the shipping season opens at Churchill?

Mr. McNAMARA: The first boat is expected there around July 28th.

Mr. MANDZIUK: Do your grain elevator agents send in reports giving an estimate of how much grain there still is on the farms?

Mr. McNAMARA: Yes.

Mr. MANDZIUK: And leading from that, I think you have areas where a four bushel quota practically cleans out the area. I had that around Elkhorn in 1959.

Mr. McNAMARA: Yes. It varies year by year. It occurred last year and the year before because when we got a five or six bushel quota, the delivery potential was being reduced, because many producers had run out of stocks at this level; but that has not been the case this year. We are finding this year that practically all producers are in a position to deliver full quotas. Our estimate of deliveries between the six bushel quota and seven bushel quota would indicate that there would be about 45 million bushels delivered, with an increase of one bushel between six and seven. With specified acreage of around 77 million acres, we feel we would have potential deliveries between six and seven bushels, and it still represents a large potential, of about 45 million bushels which would be available for delivery.

Mr. MANDZIUK: This leads to a supplementary question. I received quite a few complaints last year where the quota was raised, but there was not room at all in the elevators to have it filled. Is there much use—I am suggesting—in raising the quota, and then to have a farmer jump on somebody's back, because they cannot fill in any more?

Mr. McNAMARA: It is true that last year, as you know, the bulk of stations were put on a seven bushel quota. I think there were only 45 sixes. But many of those seven bushel quota areas we made it clear at the time that we could not guarantee that they would be provided with the full seven bushels. This raised the point as to whether the policy of the board should be to equalize the quota delivery opportunities, or whether we should continue to follow the policy that we have in the past of taking all this grain off the farms, as space would permit. I am personally very convinced that it has never been, and that it will never be, possible to equalize the producer-delivery opportunities completely unless you deliberately set a very low level, let us say of five or six bushels of quota; because after all, I think we are primarily a grain marketing organization, and we should be taking grain off the farms to the extent that it can be handled through our commercial facilities to meet our sales commitments. And if at the end of the year we have been successful in equalizing delivery opportunities within, let us say, a one bushel level, I think this is all that can be expected. We could equalize if we set a very low target, but I do not think that is the way to handle grain. I do not think the quota system was devised for this purpose.

Mr. MANDZIUK: Please do not consider my question to be casting any criticism or reflection on you. These are simply problems that we feel, and which have been brought to our attention.

Mr. McNAMARA: I quite appreciate that. And while I am on this point, I know that western members are actually anxious and concerned as to what will be the final level of quotas this year. We as a board have not yet been able to determine on the advisability of going above six. None of the stations have yet been increased above a six bushel level; but there is always an unknown factor that even the elevator agent cannot estimate at this time of the year with respect to the judgment of the individual producer, as to the volume of grain he wants to market during July, and this is often dependent on the outlook of his new crop. Last year we had gone to the seven bushel

level and had estimates from the elevator agents as to the quantity of grain that would be delivered at individual stations; but in some cases deliveries were in excess of the elevator agents' figures to the extent of 100,000 bushels. Now, what happened—and this is perfectly natural—is that during the latter part of July we were fortunate and the crop prospects improved, so producers decided it was not necessary to carry a reserve of feed or seed on their farms. They delivered every possible bushel they could.

This year I would think, with a potential of about 50 million bushels on farms, it will be held by the producers if weather conditions continue as they are, or will be delivered to us if we are fortunate to get rain and crop prospects improve. It is very difficult to estimate what 230,000 farmers will decide in the last two weeks of July. While I think the objective of equalizing opportunities is sound, this is one of the reasons why it is actually difficult at the end of the crop year.

Mr. HORNER (*Acadia*): I would like to ask a question in respect of transportation. You say here there has been a reduction in the volume of grain delivered at Pacific coast ports. Was this reduction in any way brought about by the railways curtailing shipments because of a fear they may have had that a lot of their boxcars would be tied up and that there would be no facilities for unloading because of the pending strike.

Mr. McNAMARA: It might have been a very minor reason for a few days when there was a possibility of a strike, but generally it was caused as a result of the fact that we had such a load for drying at the terminal elevators that it slowed down operations.

Mr. HORNER (*Acadia*): Further, on the matter of the drying, would you say that fifty per cent of the grain was dried at Vancouver?

Mr. McNAMARA: This is a quotation we made some time ago. During the winter months and extending until late in the crop year extensive drying operations were carried out at Pacific coast ports, at the lakehead and at the interior terminal elevators. 51.9 million bushels were artificially dried at the end of the crop year. Of this quantity, 21.3 million bushels were dried at the Pacific coast, 27.4 million bushels at the lakehead, and 3.2 million bushels at the interior terminals.

Mr. HORNER (*Acadia*): I have one further question on transportation. In moving 1600 boxcars a day—I think that is the figure which was suggested—would you say you have not had any shortage of boxcars as yet in the current movement of the crop.

Mr. McNAMARA: No. There was a period about a month or six weeks ago when we were becoming concerned with the transportation being made available, but following representations made to the railway companies this movement has picked up and is accelerated. Movement of grain out of country elevators so far this year is above that of last year, and I think the railways will continue to provide us with adequate service.

Mr. HORNER (*Acadia*): An old argument has been that the C.P.R. has been much more agreeable in providing boxcars at a good rate than the C.N.R. Is this borne out in today's movement, or has the C.N.R. been easier to get along with lately?

Mr. McNAMARA: This is always a matter of opinion. As a matter of fact this year it was the C.P.R. which was lagging and the C.N.R. was more up to date. The C.P.R. has picked up since that time with the result that both are considerably ahead of last year. I cannot press this point too much; generally speaking from both railways we are receiving excellent cooperation in the transportation of grain at the present time. We have no complaints at all in respect of the rail service being provided.

Mr. MUIR (*Lisgar*): I would like to ask Mr. McNamara a question in respect of the allocation of shipping orders. I think you mentioned that you allocate them on the basis of the handlings of the different companies and therefore distribution of cars is left more or less with the companies themselves among their own elevators.

Mr. McNAMARA: Within the quota structure. We would not let them put too many into a station where there is space for six; but within that control it would be left to them.

Mr. MUIR (*Lisgar*): I think it had been noted, particularly early in the season, that the elevator companies were inclined to send the cars out to their more competitive centers with the result that the ones sitting off alone usually were late in getting their quotas reached. Do you find that it is better since you have been more or less working along the lines of the Bracken report?

Mr. McNAMARA: No; I do not think there is much of a change in this regard. There is still active competition between the companies, which I think is to the advantage of the producers in a competitive market. I think the points where they compete are watched a little more closely than, say, some of the single elevator houses; but in fairness to the companies, they are putting a good share of their orders into these single elevator points, and I think it will be equalized.

Mr. MUIR (*Lisgar*): I was thinking about the earlier part of the season. It usually ends up with the same quota.

Mr. McNAMARA: Yes.

Mr. MUIR (*Lisgar*): There have been complaints from the single elevators that the competitive points are getting the advantage in the distribution.

Mr. McNAMARA: I would suggest that the competition which exists between these companies in this regard is a natural and probably a good thing for the producers.

Mr. ROGERS: One of my questions was covered by Mr. Forbes. I notice that you say domestic utilization remained at the level of the previous crop year. We hear a lot of figures in respect of our home consumption. What is the average home consumption percentagewise in wheat?

Mr. McNAMARA: It runs around 150 million bushels a year out. This includes the disappearance on the farms. Our grain which is delivered into a commercial position I think runs around 75 million bushels. I believe we have a table showing the domestic utilization.

Mr. ROGERS: I have heard figures like fourteen per cent.

Mr. McNAMARA: Fourteen per cent of our production?

Mr. ROGERS: On an average.

Mr. McNAMARA: Mr. Davidson and Mr. Riddel tell me it is only about 160 million bushels a year which includes feed, seed and milling.

Mr. SOUTHAM: I think there is some confusion as to the domestic consumption and the overall human consumption of wheat in Canada.

Mr. McNAMARA: If you look at table IV at the back of the report you will see that we show the figures for the domestic disappearance on the farms and the commercial consumption. For the crop year 1959-60 the farm disappearance was 81,925,000 bushels and commercial 65,821,000, or a total of about 147 million bushels that crop year. For the previous year, it was 166 million. Does that give you the information you want?

Mr. SOUTHAM: Could you give us the figure of what goes into human consumption in Canada?

Mr. McNAMARA: Just a minute now; I am getting different answers. The 166 million includes feed. 45 million bushels goes in for human consumption, and this is a pretty consistent figure.

The ACTING CHAIRMAN (*Mr. Rapp*): Mr. Korchinski has the last question on this item; then we will move on to the next one.

Mr. KORCHINSKI: Mr. McNamara, I was wondering if you could give an indication of what amount of grain came in on a one-bushel quota.

Mr. McNAMARA: The specified acreage is about 77 million acres. Therefore, a full delivery, if everyone took advantage of it, would mean 77 million bushels.

Mr. KORCHINSKI: You mentioned that you are shipping grain at the rate of 1600 cars par day. I figure, roughly, that at 1600 bushels per car—or, it could be more—

Mr. McNAMARA: That is very low.

Mr. KORCHINSKI: That is low, is it?

Mr. McNAMARA: It should be around 2,000 bushels.

Mr. KORCHINSKI: Well, I figured it at 1600, roughly, which would mean $2\frac{1}{2}$ million bushels per day. If you figured it at 2,000, it would bring it up to about 3 million.

Mr. McNAMARA: Yes.

Mr. KORCHINSKI: So, we have another 30 days left in which we possibly could move 90 million bushels.

Mr. McNAMARA: Yes, out of country elevators. That would be about right.

Mr. KORCHINSKI: So, if your one-bushel quota then represents something like 77 million, you could only accept a one-bushel quota all across the board, really.

Mr. McNAMARA: No. This is not very good arithmetic, because a number of the points still have not the full space required for a six-bushel quota, as a result of which some of these shipments will be required to take the six bushels at all points. As indicated earlier, the agents have estimated to us, an increase from six to seven would not bring in 77 million, but only 45 million bushels, or the equivalent of about 22,000 boxcars. In equalizing it at seven as compared to equalizing it at six, we estimate we would require an additional 22,000 boxcars. Now, to equalize at six, we require, if the figures in my mind are correct, 35,000 between now and the end of July, and another 22,000 would bring it up to 57,000, which would be what is required between this last date I have in July—the 14th.

Mr. HORNER (*Acadia*): Let us move on.

The Acting CHAIRMAN (*Mr. Rapp*): Gentlemen, shall we proceed to item 5? We will have item 5 read, and then I think we will leave the questions on item 5 until after the adjournment, at two-thirty this afternoon, as everyone wants to be in the house a minute or two before the opening.

Mr. EARL:

5. Delivery Quotas

On July 28, 1959 the board announced the main features of its delivery quota policy for the ensuing crop year. Effective on August 1, 1959 an initial quota of 100 units of grain was established, each unit consisting of 3 bushels of wheat, or 5 bushels of barley, or 5 bushels of rye, or 8 bushels of oats, or any combination of these grains amounting to 100 units. At the same time the board announced that the initial quota would be followed by general quotas based upon each producer's specified acreage. Specified acreage consisted of each permit holder's

acreage seeded to wheat (including durums), oats, barley and rye, as well as summerfallow and eligible acreage seeded to cultivated grasses and forage crops.

The crop year commenced with initial quotas in effect at all delivery points. The first general quotas were established in late September and these quotas were extended and increased as local space became available.

The crop year ended with a maximum general quota of 7 bushels per specified acre. Maximum general quotas were in effect throughout Manitoba at the end of the crop year; while a general delivery quota of 7 bushels per specified acre was in effect throughout Saskatchewan and Alberta, excepting at 5 and 40 stations, respectively.

In July, delivery quotas moved upward very rapidly. On July 1st, 99 stations were on a 5 bushel general quota, 1,313 stations were on a 6 bushel general quota, and 595 stations were at the crop year maximum of 7 bushels per specified acre. Early in July, 5 bushel quotas were completed and the railways concentrated on providing cars at stations which still remained on a general quota of 6 bushels.

On July 18th the board announced that where sufficient space was available in local elevators, country elevator agents could jointly request an increase in delivery quotas to 7 bushels per specified acre. In authorizing such quota increases the board did not undertake that space would be available at all points to enable all producers to deliver the new quota. Substantial progress was made in the last half of July in increasing 6 bushel general quotas to the maximum level of 7 bushels. The crop year ended with 45 stations on a 6 bushel general quota and 1,962 stations on the maximum delivery quota of 7 bushels per specified acre. The upward adjustment of delivery quotas during the month of July resulted from the shipment of about 45 million bushels of grain from country elevators.

Under the delivery quotas which were established for the crop year 1959-60, producers delivered, during the months of June and July, 167 million bushels of wheat, oats and barley, as well as smaller quantities of flaxseed and rye. Exports and domestic utilization of grain for the final two months of the crop year amounted to approximately 82 million bushels. Therefore, during the final 60 days of the crop year over 80 million bushels of grain were added to commercial supplies throughout Canada. The result was that on July 31, 1960, stocks of grain in elevators in Canada amounted to 501 million bushels. At this time the seasonal working capacity of all elevators was estimated at 521 million bushels. Elevator congestion, particularly at the Lakehead and in eastern positions, had a bearing upon board operations in the early part of 1960-61.

BARLEY

Over-quota provisions for the delivery of barley suitable for malting were continued in the crop year. Effective August 1, 1959 producers were authorized to deliver one carlot of barley suitable for malting, providing a sample of such barley had been accepted by a maltster or shipper on a premium basis.

OATS

On November 25, 1959 the board authorized a supplementary quota of one carlot of oats suitable for rolled oats or oat groats. On December 2 provision was made whereby producers could deliver one carlot of commercial seed oats on an over-quota basis.

FLAXSEED

The initial quota for flaxseed was established at 5 bushels per seeded acre, with a minimum delivery of 200 bushels. This quota was established pending further information about 1959 flaxseed production. Flaxseed was placed on an open delivery quota basis on October 13, 1959.

SOFT WHITE SPRING WHEAT

On November 16, 1959 a supplementary quota of 5 bushels per seeded acre was established for soft white spring wheat. On February 11, 1960 the supplementary delivery quota was increased to 10 bushels per seeded acre, and later in the month to 15 bushels per seeded acre. On April 5 the supplementary quota was increased to 20 bushels per seeded acre, and on May 9 soft white spring wheat was placed on an open quota basis.

RYE

There were no supplementary quotas for rye during 1959-60. Therefore, all deliveries of rye were under general quotas.

DAMP GRAIN

On December 17, 1959 the board announced that damp wheat, oats, barley and rye could be delivered up to 2 bushels in excess of established delivery quotas at individual stations. On January 4, 1960 the board announced that damp wheat, oats, barley or rye could be delivered up to 5 bushels per specified acre in excess of established delivery quotas at individual stations, providing total deliveries under each delivery permit did not exceed 6 bushels per specified acre.

SEED GRAIN

The usual provisions were made whereby producers could secure registered and certified seed on the basis of limited over-quota deliveries of commercial grades.

DELIVERIES OF GRAIN

Under delivery quotas established in 1959-60 producers delivered a total of 517 million bushels of grain and flaxseed as compared with 551 million bushels delivered in the previous crop year.

The following table shows the general delivery quota position, at the end of quarterly periods, during the crop year 1959-60:

	October 31 1959 General	January 31 1960 General	April 30 1960 General	July 31 1960 General
Initial quota.....	759	—	—	—
1 bus. per specified acre.....	951	299	—	—
2 bus. per specified acre.....	303	642	—	—
3 bus. per specified acre.....	—	600	526	—
4 bus. per specified acre.....	—	465	662	—
5 bus. per specified acre.....	—	3	510	—
6 bus. per specified acre.....	—	—	309	45
7 bus. per specified acre.....	—	—	2	1,962

Could I answer Mr. Korchinski's question?

The ACTING CHAIRMAN (Mr. Rapp): Proceed.

Mr. EARL: Under the provisional payments legislation, a total of \$1,025,839 was advanced to 2,309 producers and, of this amount, \$25,173 is still outstanding.

Mr. HORNER (*Acadia*): This is under the loans, is it not?

The ACTING CHAIRMAN (*Mr. Rapp*): This meeting now stands adjourned until two-thirty.

AFTERNOON SITTING

MONDAY, June 26, 1961.

The CHAIRMAN: Will you come to order, please. We had finished reading the item on delivery quotas. Are there any questions on this?

Mr. MUIR (*Lisgar*): Where is the soft spring wheat produced?

Mr. McNAMARA: In Alberta.

Mr. HORNER (*Acadia*): In the Acadia valley.

Mr. MUIR (*Lisgar*): Is there much of it produced?

Mr. McNAMARA: No.

Mr. W. E. ROBERTSON, (*Commissioner, Canadian Wheat Board*): It is grown in the Brooks area north of Medicine Hat.

Mr. MUIR (*Lisgar*): Is it a spring wheat?

Mr. ROBERTSON: Yes. It yields very well under irrigation.

Mr. HORNER (*Acadia*): Here you have outlined quite extensively the various grains, but you have not given any thought to including rapeseed, apparently, under the quota. I have always thought that rapeseed should be included in the specified acreage and should be listed here.

Mr. McNAMARA: Under the Canadian Wheat Board Act rapeseed is not yet designated as a grain; it has been under the Canadian Grain Act. This would require an amendment to our act.

Mr. HORNER (*Acadia*): I do not have the act in front of me, but I believe it reads to the effect that the grain shall include wheat, oats, barley, flax and rye. It does not say it shall exclude rapeseed.

Mr. McNAMARA: Could I ask our solicitor to deal with this point.

Mr. H. B. MONK, Q.C. (*Solicitor, Canadian Wheat Board*): Grain is defined under the statute as follows: grain includes wheat, oats, barley, rye and flax-seed. We have regarded those as being the grains that are subject to quotas.

Mr. HORNER (*Acadia*): In other words it is your opinion that in order to have rapeseed qualify in the specified acreage and be subject to quota it would have to be included in your Wheat Board Act.

Mr. MONK: Yes.

Mr. HORNER (*Acadia*): And you would think that would be the only way it could.

Mr. MONK: I do not say it might be the only way; but it would be one of the ways.

Mr. MUIR (*Lisgar*): Could it not be just put in the regulations governing the wheat board?

Mr. MONK: I do not think we have the power to extend the quota to matters not covered by the statute.

Mr. HORNER (*Acadia*): The statute just says it shall include; it does not say it shall exclude. It just wants to ensure that it includes those five.

Mr. PASCOE: It says here that the crop year commenced with initial quotas in effect at all delivery points. In view of the early harvest this year, if you have six or seven bushels will there still be room for the initial quota?

Mr. McNAMARA: There will not be room for the full initial quota. About one hundred million bushels of grain comes in under the unit quota and there will not be space available at the first of the crop year. A lot will depend on the outcome of the new crop. Shipments have been particularly good out of the west coast and a fair share of shipments out of the eastern ports, as well as domestic requirements and also Churchill; so, I am anticipating that space will open up for the unit quota this year somewhat more rapidly than it has for the last three years.

Mr. FORBES: A number of the oats producers have been making complaints that the oats quota is not equitable to wheat; that is, that it does not have the same value. They feel it should be on the basis of value and not quantity.

Mr. McNAMARA: You will remember that last year on account of the limited supply of oats which we had in commercial position at the beginning of the crop year, we raised the provision in respect of the delivery of oats under the unit quota from 800 bushels to 1000 bushels. That brought in considerably more oats. Since that time it was necessary to put a supplementary quota on oats. So they are delivering oats outside the specified acreage at the present time and the oats deliveries are about double this year over last year. The elevator agents are estimating another thirty million bushels of oats might be delivered this year.

The information I received today during the lunch hour would indicate that there is quite a lot of concern in certain areas in Manitoba and Saskatchewan about the feed grain situation. It is quite possible that in many areas the oats deliveries will dry up; that is, that farmers will start holding back supplies from the old crop. This will necessitate further action in regard to oats quotas in areas where supplies are available for commercial marketing.

Mr. FORBES: The oats producer has a most difficult time in getting by. He is not allowed to collect much money on his oats.

Mr. McNAMARA: This varies from year to year. Two or three years ago in respect of oats deliveries we paid carrying charges on the storage of the oats of nine cents per bushel. The quantity of oats carried in commercial position was far out of line with the market potential. In those years we had a loss in the oats pool due to the cost of carrying it.

Mr. FORBES: I think a lot of people today are trying to produce wheat when their land is more adaptable to oats. They would continue to produce oats if they could market them on an equitable basis.

Mr. McNAMARA: For the last few years we have not been successful in marketing any oats into the United States, which is our only main consumer outside of Canada. If we take in too much, the storage charges will eat into the revenue, which will result in a lower payment for the oats. It has to be related to the market potential. I am hoping that our oats will again be competitive in the United States market. We used to market 20 million to 25 million bushels a year into the New England states. If an adjustment takes place and we get back into this United States market we will take a lot more oats off the farm.

Mr. DOUCETT: What is the surplus of oats and barley right now?

Mr. McNAMARA: We are carrying about twenty-one million bushels of oats in commercial position; that is, in the elevators and terminals. When you say surplus, I would question if there is any surplus at all on oats. The situation in the prairies is such that deliveries are slightly down. There must have

been a large carry-over, over and above farm requirements, at the end of July. We will have to take more oats to meet our commitments. So I do not regard oats as being in surplus supply at the present time.

Mr. DOUCETT: What is the position in respect of barley?

Mr. McNAMARA: About 53 million bushels as compared to 42 million last year. Exports of barley have been very disappointing this year. It is only as a result of recent sales to China that we have been able to move barley in any volume for export. I am speaking of feed barley. We have moved a limited quantity of malting barley to the United States. We have been selling fairly substantial stocks of malting barley in the United States in the last few weeks.

Mr. RAPP: I would like to see the Canadian wheat board make arrangements so that at the start of each crop year room is available to take the initial quota. Last year there were places where farmers, because of lack of room, could not deliver their initial quota. If the seven-bushel quota were opened up this year there would be no room available at these places for the new crop to come in. I would sooner see room available for the 100-unit initial quota, because it is very important—300 bushels of wheat or four or five hundred bushels of oats and barley. It is very important that the farmer get an opportunity to deliver his initial quota.

Mr. McNAMARA: I know, Mr. Rapp, that this is a view which is quite widely held in western Canada. I personally do not subscribe to it.

I think that the question of the equalization of quotas and the creating of room for, say, 100 million bushels by the first of August would cause marketing difficulties. Take, at the present time, particularly in Alberta and western Canada; there are certain grades of wheat which we are short of, namely No. 4 and No. 5 wheat. We are having some difficulty now in getting sufficient supplies of No. 3 wheat to the west coast to meet our Japanese and Chinese requirements. I think it is most important that we keep the grain that is required coming into the pipeline, and have the elevator companies ship it. To me, we are a marketing agency and we should be taking the supplies and putting them into saleable position.

While I can appreciate the desire of some growers to have their quotas equalized and have readily available space in country elevators to which they could deliver their unit quota by the first of August, I think that should be secondary to the marketing potential.

As I indicated earlier, we have heavy commitments for August right to the end of the calendar year out of the west coast. We have a heavy program out of Churchill, again this year, and a larger than normal program out of the St. Lawrence, and I believe that shipments through August and September, prior to the new crop moving, will have created a lot of space.

I would not say we could take a unit quota immediately, but it will be taken more rapidly, I think, this year.

Mr. RAPP: I appreciate your explanation, because we are confronted by farmers in connection with that question quite often when the new crop year starts out and there is no room available for the initial unit. However, I can see your point, and it is a point very well taken. But, at the same time, you must appreciate that I have to be in a position to give that information out.

Mr. HORNER (*Acadia*): I would like to have this point clarified. Does rapeseed come under the specified acreage?

Mr. McNAMARA: No. Specified acreage is an instrument of the board. That is our responsibility, and in calculating on the permit book, we do not take rapeseed, which is a cash crop. We do not take sunflower or sugar beets. We only take wheat, oats, barley, flax, rye and soil improvement crops, and not cash crops.

Mr. HORNER (*Acadia*): On that very point, if a person had, say, a surplus of wheat and decided to get into the production of rapeseed, he then would not be given a permit book—where he had all his land seeded to rapeseed in any particular year, whether or not he had a surplus of other grains.

Mr. McNAMARA: If he discontinued growing wheat—grain, and went solely into rapeseed, he would not be eligible for a wheat board delivery permit. However, if he had a carry-over of grain, we would give a special permit to allow him to deliver grain which he produced while he was a producer of grain.

Mr. HORNER (*Acadia*): In other words, there is nothing in the Wheat Board Act which prohibits him from growing rapeseed to qualify under your specified acreage?

Mr. McNAMARA: No.

Mr. HORNER (*Acadia*): It is just a regulation or ruling on the part of the wheat board?

Mr. McNAMARA: Yes. Are you talking about specified acreage? We could have it in that way if we desired, but we could not put a quota into effect. The two things are separate—the definition of a grain and the specified acreage.

Mr. HORNER (*Acadia*): I would think that it should qualify under your specified acreage, and perhaps you would take this into consideration. This is my opinion.

Mr. RAPP: Mr. Chairman, I think exception should be made with rapeseed, because we pay the 1 per cent P.F.A.A. on all the rapeseed that is delivered. In connection with sunflower and any other grain that is delivered, they never are charged that P.F.A.A. rate.

How would you suggest that we could get rapeseed on the same basis as for the other grain?

Mr. McNAMARA: In so far as the quota provisions are concerned, the question is under consideration on the recommendation from the board as to the advisability of amending our act to include rapeseed as grain, the same as flax and rye. However, our act has not been opened during the last few sessions and this amendment has not been brought to the attention of parliament. Personally, I consider it is not advisable because if people other than yourself were promoting the growth of rapeseed we would get into a situation where the movement of rapeseed would interfere with the movement of other grains at country elevators and, under such conditions, I think we should have the power to quota rapeseed. In other words, if it started to back up into the country, and they became congested, I think we should have the power to quota it the same as flax and rye.

Mr. MUIR (*Lisgar*): You suggested a while ago that you thought our exports to the United States in oats and barley would come up somewhat this year. Are you saying this on account of the discount position of our dollar?

Mr. McNAMARA: Well, the spread between the Winnipeg market and Chicago market has been narrowing, and if we get to the point where Canadian oats can be laid down in the United States, thereby competing with their oats, our trade will immediately start taking advantage of that situation—and this was the normal situation in so far as oat marketing was concerned a number of years ago. However, during the last few years, and particularly since the Americans have been subsidizing their oats for export, our prices have been out of line with theirs to the extent that there has been no marketing for Canadian oats in that particular area. We used to sell a lot of heavy oats for racehorses and things like that in the United States.

Mr. MUIR (*Lisgar*): Do you adjust your prices according to the discount, or what?

Mr. McNAMARA: The wheat price, yes.

Mr. HORNER (*Acadia*): The oat prices, as well?

Mr. McNAMARA: Well, they are handled through the future market in Winnipeg. The level is determined by the level of the market in Winnipeg.

Mr. HORNER (*Acadia*): Then, it would be adjusted?

Mr. McNAMARA: Yes. They reflect the value. There has been an increase in all our grain prices as well.

Mr. FORBES: And this will take place from time to time?

Mr. McNAMARA: Yes.

Mr. BOULANGER: Mr. Chairman, we are talking about all kinds of things except item No. 5. If we are going to talk about everything else, I would like to talk about the feed business in the east. Would I be allowed to do that?

Mr. MUIR (*Lisgar*): On a point of order, Mr. Chairman, I am talking in connection with item No. 5, concerning oats, barley and flaxseed. These grains are listed, and I want some information on these items within item No. 5. I am going to get this information as long as I am a member of this committee.

I have one more question and then I will pass. Did I understand you to say that our oats have not been competitive with the American oats?

Mr. McNAMARA: That is right.

Mr. MUIR (*Lisgar*): Their prices have been lower than ours?

Mr. McNAMARA: Yes.

Mr. PASCOE: It mentions about setting a quota on a specified acreage, and then it says "including Durums". This is in reference to last fall when there was an open quota on Durums. However, they can still deliver the wheat on that specified acreage. Do you receive many complaints on that?

Mr. McNAMARA: No. At the first of the season, when we opened the quota on Durums, there was some concern in the country; however, when it was explained this market had developed and we could move it right out of Canada, that explanation was well taken.

I might mention, as well, that our exports of Durum this year will be around 40 million bushels. We will have cleaned out practically all the Durum in commercial position in Canada by the end of the crop year.

Mr. SOUTHAM: I have a supplementary question: Was the demand for Durum for food or seed purposes?

Mr. McNAMARA: Mostly for feed purposes, macaroni and seminola.

Mr. SOUTHAM: I had a report—and I was trying to confirm it—that a certain amount of it was going to be used for seed purposes.

Mr. McNAMARA: I would think a very limited portion was used for seed.

The CHAIRMAN: Do you have a question, Mr. Boulanger?

Mr. BOULANGER: On this item?

The CHAIRMAN: Yes.

Mr. BOULANGER: No, I do not.

Item 5 agreed to.

On item 6 "handling agreement".

Mr. EARL:

6. Handling Agreement

In the 1959-60 Handling Agreement with elevator companies, handling margins remained at $4\frac{1}{2}$ cents per bushel for wheat and barley and $3\frac{1}{2}$ cents per bushel for oats. The storage rate was unchanged from the previous crop year, being $1/30$ th of a cent per bushel per day

for wheat, oats and barley in store country elevators. The terminal storage rate, subject to maximum tariffs as established by the Board of Grain Commissioners for Canada, continued at 1/30th of a cent per bushel per day.

Following negotiations between the handling companies and interior mills, the diversion charges on wheat shipped to such mills remained unchanged from the previous crop year. Similarly, diversion charges applicable to interior terminals, Churchill and Prince Rupert were unchanged.

Mr. KORCHINSKI: I was wondering if there was any indication from any of the companies that they might increase their handling charges, or would like to have the handling charges increased?

Mr. McNAMARA: I do not know whether or not they would like it, but we were successful in negotiating an agreement with them last fall to maintain the same prices which had been in effect for a number of years. I reported to the committee that we as a board were naturally always anxious to reduce our costs to the greatest extent that it was possible, and that we negotiate with the idea of reducing prices; but we have not been able to effect a reduction in recent years. I think I also mentioned to the committee that in fairness to the trade it should be pointed out that the handling charges on wheat oats and barley, which are in effect, are pre-war, and that on the storage there has been no increase. But of course the volume of grain we have carried in store elevator, 1956, as compared to this has greatly increased the earnings.

Mr. KORCHINSKI: For this agreement you negotiate on a yearly basis?

Mr. McNAMARA: Yes, it is done on a yearly basis.

Mr. KORCHINSKI: Is there any possibility that eventually we may do away with the diversion charges some time?

Mr. McNAMARA: I would doubt it very much. This question of the determination of diversion charges has been asked for years. The operation of a terminal is part of the overall operation of any elevator company; they have their country elevators and they have their terminals. If you try to separate the terminals from the country elevators, you put thereby a much heavier burden on the country elevator charges. If you take the grain away from the country elevator company and deprive them of the potential earnings on that grain in their terminals, they will lose out on their overall operations. I cannot foresee it being abandoned, with merely a diversion from the country-owned terminal, let us say, to Prince Rupert, to a government terminal, where they do not participate in the potential earnings on that grain. It is only reasonable that they should be allowed to have diversion from time to time, and the same applies to Churchill.

Mr. CLERMONT: Mr. Chairman, under which heading are we to discuss deliveries to the east of wheat, oats, and barley?

Mr. McNAMARA: We are prepared to have a full discussion of this question. We are keenly interested in the problem. In our supplementary report we make special reference to it, and in addition we have some data we are prepared to file with the committee. But it is up to the committee. Nevertheless it will come up formally for discussion under our supplementary report.

Mr. PASCOE: In regard to storage charges, I am thinking about off-site storage, and the use of such off-site storage as roundhouses. Would there be the same storage charges in payment for off-site storage in such locations?

Mr. McNAMARA: Yes. We would pay the country elevators the same rate. They assume the same responsibility for the quality and condition of the wheat, actually delivered to us at Fort William; therefore they get the same storage charges on off-site storage as they would on primary storage.

Mr. PASCOE: Is there any agreement as to how long the wheat will stay in there?

Mr. McNAMARA: No.

Mr. PASCOE: You say the handling would be the same as if it were going through the elevators?

Mr. McNAMARA: Yes, they can be the same. As a matter of fact the policy we have been pursuing is to try to turn over the stocks of what we call off-site storage. I believe now we have moved out of off-site storage all grain delivered prior to 1956. This year we will probably be completing 1956. There was very little grain which went into that type of off-site storage since that time; I am referring to such places as curling rinks. The only off-site storage for licence now is off-site storage which is serviced by a railway on track; so this type of off-site storage which was brought about in the pre-war period is being abandoned.

Mr. KORCHINSKI: Could you give us an indication of how much grain is in storage in off-site storage?

Mr. McNAMARA: I do not believe we have those figures, but we could get them for you by checking with Winnipeg. I think probably our country operation would have that information available quite readily. It is just a limited quantity now.

Mr. HORNER (*Acadia*): This is $\frac{1}{30}$ of a cent per bushel per day; that is what is paid out to the country elevator. It is true that the government interior elevator receives storage at a lower rate?

Mr. McNAMARA: We pay the government interior elevator $\frac{1}{45}$ as compared to $\frac{1}{30}$; We are not discriminating against the government elevators, but the cost of moving grain into a government elevator is more expensive than it used to be, as there is a special charge over and above the normal handling charge. But they have recently been increasing the transit charges. Mr. Riddell has some information on it which he could give you.

Mr. HORNER (*Acadia*): You say it has been increased?

Mr. McNAMARA: The railways—and I am speaking from memory—say that it costs four or five cents a bushel now for the initial movement to put grain into interior elevators.

Mr. HORNER: Why would it cost the railways more to move grain to one elevator than to another?

Mr. McNAMARA: They assess a special charge; and they increase this special charge every six months so that it becomes a very expensive operation. I told Mr. McConnell quite recently that if the board were to pay a higher rate for storage in interior terminals, we should not be using those interior terminals, because they are too expensive. It is only because we can store grain cheaper in those facilities that we consider using them at all.

Mr. HORNER (*Acadia*): I cannot understand how this formula with the railways increases every six months.

Mr. McNAMARA: We will get that information for you, and I will give it to you tomorrow in detail. I will give you a breakdown of it, if you would like it. We have some information on this, this matter of the initial charge for putting wheat in government elevators; it is, $1\frac{1}{4}$ cents per bushel, and the diversion charge is $1\frac{1}{2}$ cents per bushel, which along with stop-off makes the total of $4\frac{1}{2}$ cents a bushel. And if the grain is later re-shipped to an elevator company, and it is shipped out, we get a refund of the diversion charge. But Mr. Riddell will explain this.

Mr. RIDDEL: That is provided the grain is not tough or damp, and that it does not contain a high dockage, that is, a dockage of over $2\frac{1}{2}$ to 3 per cent.

Mr. HORNER (*Acadia*): The government elevator will not take it if it has a high dockage?

Mr. RIDDEL: Yes, the elevators will take it, but they suffer a loss if that grain has a very high dockage.

Mr. McNAMARA: When wheat is stored in interior terminals and later re-shipped, the board pays the railway a stop-over charge. This charge is based on the length of time the wheat is stored in terminals, that is, up to 12 months, 3 cents per 100 pounds; 12 to 24 months, $5\frac{1}{4}$ cents per 100 pounds; 24 to 36 months, $7\frac{1}{2}$ cents per 100 pounds; 36 to 48 months, $9\frac{3}{4}$ cents per 100 pounds; 48 to 60 months, $11\frac{3}{4}$ cents per 100 pounds; 60 to 72 months, $13\frac{3}{4}$ cents per 100 pounds; and from 72 to 84 months, $15\frac{3}{4}$ cents per 100 pounds.

Mr. HORNER (*Acadia*): In respect of the operations of the government terminal, is it the policy to leave the wheat there for a long time, once it is there?

Mr. McNAMARA: Yes. We consider that, in our operation generally, as dead storage; but it is also valuable at times when we get into a situation like we did in Vancouver where we are behind on our shipping. This is clean grain which we can rush out to meet a particular commitment. We have found it useful at times in Vancouver and Churchill; we have moved stocks from Saskatoon.

Mr. HORNER (*Acadia*): What would this stop-over charge amount to in a year to the railroad?

Mr. McNAMARA: We will get this information for you. Speaking quite frankly I can see no reason why the railways are assessing us this particular charge. We have argued with the railways that once they moved it into an interior terminal and it stays there for six or twelve months, we do not think they should get an extra earning.

Mr. HORNER (*Acadia*): That is my point.

Mr. McNAMARA: I think we are in agreement on this.

The CHAIRMAN: 1959-60 pool account—wheat.

Mr. EARL:

7. 1959-60 Pool Account—Wheat

POLICY

In accordance with the Canadian Wheat Board Act, 1935, as amended, the Board administered an annual pool for wheat delivered to the Board between August 1, 1959 and July 31, 1960.

The fixed initial price for wheat for 1959-60 was \$1.40 per bushel basis No. 1 Northern Wheat in store Fort William/Port Arthur or Vancouver. This initial price was authorized by Order in Council P.C. 1959-788, June 22, 1959. Initial prices for grades of wheat other than No. 1 Northern were established by the Board and approved by Orders in Council.

Under Order in Council P.C. 1959-788, June 22, 1959, the Board was required to sell wheat, other than Durums, for domestic use at the same price as it sold wheat for registration under the International Wheat Agreement.

BOARD RECEIPTS

The following table shows receipts of wheat from producers, by months, for the period from August 1, 1959 to July 31, 1960:

	Bushels
August, 1959	2,470,711.6
September	15,897,269.3
October	20,767,216.5
November	31,698,680.5
December	36,841,566.6
January, 1960	32,218,945.7
February	19,019,624.2
March	14,673,961.2
April	26,364,643.4
May	42,386,670.6
June	52,368,832.2
July	82,730,252.4
TOTAL	377,438,374.2

Board receipts from producers in 1959-60 were 377,438,374.2 bushels as compared with 366,994,151.9 bushels in the previous crop year. Producers' deliveries of wheat were relatively small during the first three months of the crop year but increased during the November-February period. Over one-half of wheat deliveries for the crop year occurred in the final four months.

Of receipts from producers, 39.6 million bushels were graded as tough and 26.2 million bushels as damp.

GRADE PATTERN

The following table shows receipts from producers, by principal grades, for the crop year 1959-60, along with the percentage of total receipts represented by each of the principal grades:

Grade (Including Toughs and Damps)	Bushels	% of Total
No. 1 Northern	2,114,101.3	.56
No. 2 Northern	119,948,351.0	31.78
No. 3 Northern	131,843,747.1	34.93
No. 4 Northern	43,385,513.4	11.50
Nos. 1 to 4 Durum (including Extra 4 Durum)	19,159,365.8	5.08
Nos. 1 to 3 Garnet	393,350.1	.10
No. 5 Wheat	45,514,528.2	12.06
No. 6 Wheat	7,375,908.1	1.95
Feed Wheat	590,312.8	.16
Other grades	7,113,196.4	1.88
TOTAL	377,438,374.2	100.00

Two-thirds of Board receipts of wheat in 1959-60 consisted of the grades No. 2 Northern and No. 3 Northern. Receipts of these grades were 119.9 and 131.8 million bushels, respectively. Two factors continued to increase Board receipts of No. 4 Northern, No. 5 Wheat and No. 6 Wheat; these were frost damage sustained in central and northern areas of Saskatchewan and Alberta, and weathering as a result of the

delayed harvest. Receipts of No. 4 Northern were 43.4 million bushels. Receipts of No. 5 Wheat and No. 6 Wheat were 45.5 and 7.4 million bushels, respectively.

TOTAL WHEAT STOCKS—1959-60 POOL

Total wheat stocks in the 1959-60 Pool were 528,175,483.3 bushels, consisting of 377,438,374.2 bushels received from producers, 148,495,836.2 bushels transferred from the 1958-59 Pool Account as at May 20, 1960, and 2,241,272.9 bushels received from others than producers.

Mr. BOULANGER: I see here that the board was required to sell the wheat at the same price it sold wheat under the international wheat agreement. Can you tell us what is the price at which we sold our wheat to China lately?

Mr. McNAMARA: The first sale to China—I do not have the exact figure. We are speaking about the current crop year. The first cash sale to China was made at the regular board selling price. There was an adjustment made about the same time between the Vancouver price and the St. Lawrence price. The wheat sold to China, on the day it was sold, was $1\frac{1}{2}$ cents under the Vancouver price, but we adjusted our Vancouver price at that time to the market level. Our last sale to China was an extension of the first agreement. The only difference was in the payment terms made. It was made at the Board's regular selling price, basis Vancouver or St. Lawrence. There was, of course, a small risk involved because we accepted payment in sterling, and until such time as all the sterling has been disposed of we are not in a position to finally assess the net returns on that wheat. Recent developments in the value of sterling, however, have made our position look very much more comfortable than it was a few days ago.

Mr. RAPP: The fixed initial price for the crop years 1959-60 and 1960-61 was \$1.40 per bushel.

Mr. McNAMARA: For No. 1 Northern.

Mr. RAPP: Yes. Through the savings in respect of the St. Lawrence and through the savings now on the dollar exchange, what would be the opinion of the wheat board should the initial price of wheat be raised to, say, \$1.45 or \$1.50? As I say, I base my reasoning on these two items, namely the St. Lawrence seaway and the dollar exchange. In the papers the statement was made on the front page or on the second page that the price of wheat went up five cents. Would it be in order to raise the initial price?

Mr. McNAMARA: I would point out that this is a decision for the government. The government sets the level of the initial payment price. Once it is determined it becomes the floor price, because once you pay your initial payment price it cannot be recovered. I would suggest that the recent revision in prices due to the exchange should not be taken as too bullish a figure. We were forced to reduce our prices during the period when the Canadian dollar was trading at a premium. I am looking at a table on page 18 where it shows the initial payment prices. Over the years the final realized prices went up until in 1947-48 the initial payment price was \$1.35. In 1948-49 it was \$1.55. During the period of the British contract, from 1950 to 1951 the initial payment was \$1.40 and yet the realized price was \$1.86. At the present time our final price on No. 1 Northern is in the neighbourhood of \$1.60. So a twenty cent margin is not very great between the final realized price and the initial payment price. If the government asked my advice, I would not recommend an increase in the initial payment price.

Mr. RAPP: I wondered what would be the reaction of the Canadian wheat board to having the price increased. I realize fully that this is a matter of government policy in respect of the initial price.

Mr. HORNER (*Acadia*): I have one question arising out of this paragraph:

Under order in council PC1959-788, June 22, 1959, the board was required to sell wheat, other than Durums, for domestic use at the same price as it sold wheat for registration under the international wheat agreement.

What did it sell at before 1959?

Mr. McNAMARA: This comes under the wheat board regulations. The governor in council approves of these regulations each crop year. This has been carried on ever since the international wheat agreement has been in effect.

Mr. MILLIGAN: Did I understand Mr. McNamara to say that in respect of the deal with China that payment for the wheat would be in sterling?

Mr. McNAMARA: Yes.

Mr. MILLIGAN: Or in American funds.

Mr. McNAMARA: In sterling.

Mr. MILLIGAN: All in sterling?

Mr. McNAMARA: Yes.

Mr. HORNER (*Acadia*): The second deal.

Mr. McNAMARA: The first deal too. This was the method of payment. They insisted that they wanted to pay us in sterling. We decided we would accept sterling. We knew there was some risk; but we have been accused of being very inflexible and this was being a little more flexible. We took the risk. At one time the market in sterling weakened and it looked as if we might be confronted with a sizeable loss. Recently, however, sterling has increased, and if we got the sterling from the Chinese now and marketed it at today's price we would have a substantial profit. How it will end up, I do not know.

Mr. BOULANGER: What is the recent increase; it is eight cents?

Mr. McNAMARA: We put it up five cents last Wednesday morning as a result of the budget and the change in the dollar. I would like to make a statement to the committee in connection with the price of wheat. I notice this morning there is an article in a Toronto paper criticizing the board's pricing policy.

Mr. SOUTHAM: Before you do that, I have a question. Are our shipping requirements to China keeping up to schedule?

Mr. McNAMARA: Yes. They have asked us to preship and we are well ahead of schedule.

Mr. FORBES: In the case of shipments of wheat to Brazil, what currency would it be adjusted to?

Mr. McNAMARA: The American dollar or the value of gold as it relates to the international monetary value.

Mr. FORBES: Now I am really mixed up.

Mr. McNAMARA: I am a little mixed up myself in respect of international finance.

I would like to read a statement here and then Mr. Riddel might comment on it.

Mr. FORBES: You say it is adjusted to American currency.

Mr. McNAMARA: Yes. The main point is that if we had not increased our price as a result of the weakening of the dollar, our price in the U.S. market would have been lowered. This article suggested we should be lowering our price. Whoever wrote the article does not realize that the Americans are subsidizing to our price. This could have meant a lowering of prices all over the world. They set their subsidies at 3 o'clock every afternoon after our price comes out. I suggest, insofar as Canada is concerned, with very un-

favourable crop prospects this year, this is not the time for Canada to be considering lowering prices in the world market. I wanted to make this statement because I think there is some misunderstanding in regard to prices.

Memorandum:

Re: Increase in wheat price quotations

The recent action of the Canadian wheat board in increasing its asking prices for all grades of wheat in all positions, following the reduction in the value of the Canadian dollar, has been criticized in some sources as defeating the basic policy of the government to reduce the cost of Canadian goods abroad and thereby improve Canada's competitive position.

- (1) In this connection the following points should be stressed: The increase in wheat prices simply followed the change in value of the Canadian dollar in terms of the United States dollar, as has been the traditional policy of the board.
- (2) The price fluctuations due to exchange have not affected the cost of Canadian wheat in overseas markets. Had the new value of the Canadian dollar not been reflected in our wheat prices, the effect would have been a reduction of approximately 5 cents per bushel in the international price level for Canadian wheat.
- (3) Wheat is an international commodity and prices are highly competitive. Any major reduction in the overseas price of Canadian wheat would undoubtedly have been met by our competitors, either through increased government subsidies as in the United States, or reduced price quotations by countries such as Argentina and Australia. The result would have been a general lowering in the international price level for wheat at a time when prices for this commodity are tending to firm, and when some segments of the trade consider price increases are justified.
- (4) The western producer has had to absorb the loss resulting from lower wheat prices during the past several years when the Canadian dollar has commanded a premium over the American dollar. Consequently he should also have the benefit of higher domestic prices resulting from devaluation of the Canadian dollar.

Mr. HORNER: (Acadia): We heartily agree.

Mr. BOULANGER: It is all right to quote a price on the international market, but in connection with the eastern price, the wheat costs up to 5 cents a bushel more and, in a couple of cases, I think it is 8 cents. Farmers are not anxious to pay this increase in price.

Mr. McNAMARA: That is true.

Mr. BOULANGER: We would be paying more for that than we would be paying for corn. I do not know what will happen in the east.

Mr. McNAMARA: As I said earlier, we are looking forward to discussing with you in some detail this problem of the eastern market. As the dollar was at a premium, the price kept coming down; and the eastern feeder got the benefit. However, the Canadian problem, as far as feeding wheat is concerned is the fact that we have not the supplies of the low-grade wheat—the cheaper, attractive wheat which the eastern feeder was able to produce for so many years. We were sold out of these stocks, and now we can only supply the higher grade wheat.

Mr. BOULANGER: Could I ask you a question?

Mr. McNAMARA: Yes.

Mr. BOULANGER: Why do you not put the higher grade of wheat at the same price as the poorer wheat so we can use the wheat that we have in

surplus in the west, instead of going down to the States and paying \$12 more for corn than we are paying for wheat.

Mr. McNAMARA: Are you suggesting we put the price of the lower grade up to the top price, or do you want us to lower the top price?

Mr. BOULANGER: Lower the price of the higher grade.

Mr. HORNER (*Acadia*): Make sure that that is on the record.

Mr. BOULANGER: I could explain it to you better in French than in English.

Mr. McNAMARA: The thing that you must remember, sir, is that the Canadian wheat board is responsible, under our act as passed by parliament, to market the grain delivered to us by the western producer to the best possible advantage.

Mr. PASCOE: Under this wheat pool account, the final payment announced a while ago is quite high for the low grades. Could you outline why it was so high? Did they put a lower initial price, or did they sell it for a better price than anticipated?

Mr. McNAMARA: The point is that the governor in council sets the initial payment price level for the top grade of No. 1 northern, and then the Canadian wheat board, subject to the approval of the governor in council, sets the discounts for the lower grades—No. 2 northern, No. 3 and No. 5. We usually do that at the beginning, or when we know the pattern of the new crop. In years where we have had low-grade wheat in surplus supply, we have had to widen out the selling discounts to move it. Recently, when the market has been keen for the low-grade grades, we have been successful in narrowing the spread, as the result of which we were able to sell the low-grade wheat at a narrower discount under the No. 1 northern than we thought was possible.

Mr. SOUTHAM: I have a supplementary to that. In the final closing out of the 1959-60 pool, we had an average payment of twelve point something per bushel. Does that indicate a gradual strengthening of the tone of the over-all market?

Mr. McNAMARA: No. You will notice, when we get to our supplementary report, that we give the details of the grade payment price for No. 1 and No. 2 northern, and it is about the same as last year. However, the average is high because of the higher prices we were able to reflect on the low grades.

Mr. MUIR (*Lisgar*): I have a question in connection with that 1959-60 pool. I note, in the makeup, that you show 2,241,000 delivered by others other than producers; who are these other people, other than producers?

Mr. RIDDEL: That total, Mr. Chairman, of 2,314,000 is made up of overages in country and terminal elevators of 2,408,000, less shortages of 250,000 bushels, the sale of government samples of wheat, 13,500 bushels, deliveries to the board under special permits, 3,900 bushels, and gristing, 139,000 bushels. I think that is wheat delivered to small mills in the designated areas which they do not use for gristing into flour, but ship forward to terminal positions and re-deliver the wheat to the Canadian wheat board.

Mr. MUIR (*Lisgar*): Do they need a special permit to do this?

Mr. RIDDEL: Yes.

Mr. McNAMARA: Mr. Chairman, I would like to suggest to the committee, that instead of dealing with the 1959-60 pool account which follows, and the statement, that we pass on to the next page, to: "General comments on the marketing of wheat—1959-60". The reason for my suggesting this is that these figures are at July 31, and when we get to the supplementary report, we will be dealing with the final figure for the top grade, and I think the information there would be much more realistic.

The CHAIRMAN: Is that agreed?

Some Hon. MEMBERS: Agreed.

Mr. EARL:

GENERAL COMMENTS ON THE MARKETING OF WHEAT—1959-60

STOCKS UNDER ADMINISTRATION

The board commenced the crop year with an inventory of 372.7 million bushels of wheat for the account of the 1958-59 pool. From August 1, 1959 to July 31, 1960 producers' deliveries to the 1959-60 pool amounted to 377.4 million bushels. During the crop year the board therefore had under administration 750.1 million bushels of wheat for the account of the 1958-59 and 1959-60 pools. The two pools were administered concurrently until May 20, 1960, when the 1958-59 account was closed and remaining stocks in that pool transferred to the 1959-60 account. From August 1, 1959 to May 20, 1960 sales were applied to the 1958-59 pool account to the extent that this pool could supply the grades required to meet sales contracts. From May 20, 1960 to July 31, 1960 all sales were applied to the 1959-60 pool account.

THE INTERNATIONAL WHEAT MARKET—1959-60

World trade in wheat, estimated at about 1,300 million bushels, was at a relatively high level in 1959-60, and only slightly smaller than in the record season of 1956-57. Important changes occurred in the direction of international trade in wheat. There was a decline in the movement of wheat to Western Europe and an increase in the movement to Asia.

Exports to Western Europe declined by about 65 million bushels. This area required less imported wheat because of the record production in 1959 and the almost ideal conditions which prevailed during the harvesting season. As a result, importing countries in Western Europe not only produced more wheat than ever before, but quality was above average. The decline in import requirements was particularly noticeable in the United Kingdom and the Federal Republic of Germany. France, Italy and Spain were exporters, principally to European destinations.

In contrast, there was an increase in wheat requirements of Asiatic countries. Increased requirements in this area were largely absorbed by concessional sales on the part of the United States and by increased commercial exports by Australia and to a lesser extent by Canada. Among Asiatic countries enlarging their imports in 1959-60 were Japan, Pakistan, Iran and Iraq.

Since the enactment of Public Law 480 in 1954, disposal and assistance programmes have become of increasing importance and now constitute a significant segment of world trade in wheat. In the non-commercial distribution of wheat the United States has played a leading part because of the extent of the American wheat surplus and the financial resources which the United States is able to employ in the distribution of such surpluses. Canada participates in this form of trade to a lesser degree through assistance programmes for Colombo plan countries and relief shipments to meet urgent needs. United States exports in this category in 1959-60 were 373 million bushels, and Canadian participation was in the amount of 8.6 million bushels. These quantities of wheat, distributed outside normal commercial procedures, accounted for close to 30 per cent of world trade in wheat in the past crop year. In this category may also be included 147 million bushels of wheat provided by the U.S.S.R. to other Communist countries. After allowing for the foregoing non-commercial shipments, it is apparent

therefore that the international commercial market for wheat in 1959-60 amounted to about 750 million bushels. It is in this latter market that the bulk of Canadian wheat exports must be sold.

The division of the world wheat market into commercial and non-commercial segments is now recognized. Commercial and non-commercial trade in wheat are recorded separately by the international wheat council. The United States wheat export statistics show separate tabulations for exports on a commercial basis and for exports under disposal programmes.

The following table shows Canadian wheat and flour shipments under government programmes and sales under the provisions of the Export Credits Insurance Act from 1954-55 to 1959-60:

Crop Year	Canadian wheat and flour shipments under Government programmes ¹	Sales under Provisions of Exports Credits Insurance Act
	(thousand bushels)	
1954-55.....	201	3,620
1955-56.....	265	26,160
1956-57.....	1,416	9,523
1957-58.....	31,070	2,908
1958-59.....	18,248	5,408
1959-60.....	8,596	4,872

¹ Including long term loans.

The following table shows Canadian government programmes, by country, for 1959-60:

Country	Thousand bushels
Burma.....	228
Ceylon.....	630
Chile.....	507
India.....	4,116
Indonesia.....	316
Pakistan.....	2,157
U.N.R.W.A.*.....	489
Vietnam.....	153
TOTAL.....	8,596

* United Nations Relief Works Agency.

United States shipments under various government programmes are shown on page 19 of this report.

In the commercial segment of the international wheat market competition was exceedingly keen in 1959-60. Surpluses in Canada, the United States, Australia, Argentina, the U.S.S.R. and exporting countries within Western Europe were offered on a competitive basis to importing countries. Commercial exports from Canada amounted to 269 million bushels as compared with 134 million bushels sold commercially by the United States, and exports of 122 million bushels by Australia and 77 million bushels by Argentina.

The CHAIRMAN: Are there any questions up to this point?

Mr. EARL:

SALES POLICY

The sales efforts of the board were directed primarily toward merchandising high-quality milling wheat which comprised the grades of No. 2 northern and No. 3 northern, along with lesser quantities of No.

4 northern. One of the factors relating to quality in milling wheat is the protein content. The research laboratory, board of grain commissioners for Canada, reported as follows:

"The mean protein content of the 1959 crop of hard red spring wheat is 14.2%; this level is 0.4% higher than obtained in last year's survey and is 0.7% higher than the long-term average of 13.5%. The 1959 protein level has been exceeded only twice, in 1941 and 1936, when the protein levels were 15.1% and 14.9% respectively."

In addition to high-quality milling wheat, the board had Durum grades of wheat and limited quantities of No. 5 wheat and No. 6 wheat. These latter grades formed a useful part of the 1959-60 inventory.

As in previous crop years, the board placed great stress upon realistic pricing and the importance of maintaining a steady flow of Canadian wheat in export trade. Provisions for the separate pricing of wheat, basis in store Pacific coast ports, Churchill and St. Lawrence ports, were continued, as well as provision for deferred pricing at the option of the buyer. The board continued to maintain close contacts with all wheat importing markets with the objective of furthering Canadian competition at all times.

The more important elements in board sales policy are discussed in the following paragraphs.

The CHAIRMAN: Are there any questions in connection with sales policy? If not, would you proceed.

Mr. EARL:

PRICING

The board continued its deferred pricing policy. In 1959-60 the buyer had the right to declare the final price up to 8 market days after the date of call on shipment from St. Lawrence or Atlantic ports, and from 15 to 22 market days from date of loading from Pacific coast ports, depending on the destination of the shipment. A similar policy was applied to Churchill, the buyer having the right to declare the final price up to 9 market days after the date of call. Prior to the opening of the Seaway in 1959 the board provided for deferred pricing on direct overseas shipments from the Lakehead following the opening of navigation. Under this arrangement the buyer had the right to declare the final price up to 14 days after date of call on such shipments from the Lakehead. Lesser periods were provided for direct shipments originating at intermediate ports between the Lakehead and the St. Lawrence. If the deferred price basis were selected by the buyer, provision was made for an accounting price to be established at the time of call, but this price would be adjusted finally within the time limits provided for each shipping range.

During the crop year the Board also continued to quote separate asking prices for wheat (a) in store Pacific Coast ports, (b) in store Fort William/Port Arthur, and (c) in store Churchill. The Board also quoted asking prices for wheat c.i.f. St. Lawrence ports, c.i.f. Atlantic Maritime ports and, as required, in store at intermediate Seaway ports. The objective of regional pricing was to maintain the competitive position of export wheat irrespective of the port of shipment.

The export flour adjustment policy was also continued in 1959-60.

In mid-August, 1959, export flour adjustment rates were reduced by one cent per bushel. For the balance of the crop year the rates were as follows:*

To the United Kingdom and European countries via all shipping routes 4½ cents per bushel

To all other countries (excluding the United States, its territories and possessions) via:

(1) Canadian Atlantic or U.S.A.

Atlantic ports 15½ cents per bushel

(2) St. Lawrence ports, Churchill,
or Canadian Pacific or U.S.A.

Pacific ports 14½ cents per bushel

*The above export flour adjustment rates were subject to mill area reductions as follows:

Montreal area—a reduction of 2c to 3c per bushel.

Toronto area—a reduction of 1c to 1½c per bushel.

Port Colborne—Humberstone area—a reduction of 1c to 1½c per bushel.

Bay Port area—a reduction of ½c to 1c per bushel.

Western Mills—no reduction.

The cost of the export flour adjustment policy to Pool Accounts operated in 1959-60 was \$3,776,380.39.

Through its pricing policies the Board endeavoured to maintain a strong competitive position in all markets. During the crop year 1959-60 average Board asking prices for No. 1 Northern Wheat were slightly lower than in 1958-59, the decrease being ⅔ cents per bushel basis in store the Lakehead and 3 cents per bushel basis in store Vancouver.

The following table shows monthly average Board asking prices for No. 1 Northern Wheat in store Fort William/Port Arthur, in store Vancouver, and in store Churchill:

Mr. MUIR (*Lisgar*): I would like to know the reason for the deferred price after the boat is loaded. Why do you allow this lapse of time?

Mr. McNAMARA: This is done according to a policy inaugurated by the board a number of years ago which is considered very beneficial to us in competitive selling with other countries in the export market. Under this provision a British miller, as buyer, is enabled to take wheat from Canada and carry it on the hedge until the grain practically arrives at his mill, and then he has to price it. He has the right to price it at any time during this period, and we keep our prices fluctuating from day to day. But it does provide him with a hedge that is very much appreciated, and it has been a policy that the Americans have found very difficult to cope with or to compete with; it has been a real sales advantage to us, and I think over a period of time we benefit greatly by it.

Mr. BOULANGER: This is the present policy for the export market?

Mr. McNAMARA: Under instructions we receive from the government we sell at the same level for the domestic market sales as we do for the export market. Our domestic prices are the export prices as quoted on the basis of Port Arthur-Fort William.

Mr. BOULANGER: What you are saying here is that you price your grain on the domestic market the same in the east as in the west.

Mr. McNAMARA: The Fort William price, yes. That is right. But we will be dealing with that later on.

Mr. BOULANGER: yes, I am very anxious.

MR. EARL:

Monthly Average of Board Asking Prices
I.W.A. and Class II Quotations
Basis No. 1 Northern Wheat

	In Store Fort William/ Port Arthur	In Store Vancouver	In Store Churchill

¹ October 1st to 15th.² November 13th to 30th.

As shown in the above table Board asking prices for No. 1 Northern Wheat basis in store Fort William/Port Arthur fluctuated within narrow limits during the crop year 1959-60. Monthly average asking prices ranged from a low of \$1.64 $\frac{1}{8}$ per bushel in October, 1959 to a high of \$1.68 $\frac{1}{2}$ per bushel for the month of June. In the main, fluctuations in Board asking prices for No. 1 Northern Wheat in store Fort William/Port Arthur fluctuated inversely with the value of the Canadian dollar on exchange markets. The strength of the Canadian dollar was reflected in Board asking prices for wheat from August through March, the decline in the exchange value of the Canadian dollar during the April-June period and the strengthening of the Canadian dollar in the final month of the crop year.

Board asking prices for No. 1 Northern Wheat in store Vancouver reflected not only the exchange value of the Canadian dollar, but changes in forwarding costs of wheat from Pacific Coast ports to overseas destinations as compared with forwarding costs from Atlantic Maritime ports and St. Lawrence ports. Monthly average prices for No. 1 Northern Wheat basis in store Vancouver declined from \$1.74 $\frac{1}{8}$ per bushel in August, 1959 to \$1.69 $\frac{3}{8}$ per bushel for the month of March, 1960. During the final four months of the crop year Board monthly average asking prices for No. 1 Northern Wheat in store Vancouver ranged from \$1.71 $\frac{1}{2}$ to \$1.75 per bushel.

In the case of asking prices for wheat in store Churchill, monthly average prices declined moderately during the shipping season of 1959, strengthened during the November-February period, declined for the month of March and strengthened again in the latter part of the crop year.

During 1959-60 adjustments were made in selling discounts for No. 2, No. 3, No. 4 Northern Wheat, No. 5, No. 6 Wheat and Feed Wheat. Adjustment in grade spreads as between No. 2 and No. 3 Northern reflected the desire of the Board to increase sales of No. 2 Northern as this grade predominated in Board inventories, especially during the latter half of the crop year. In May, 1960 the Board selling discount for No. 2 Northern was increased from 3 to 5 cents per bushel. Selling discounts for No. 3 Northern were narrowed during the crop year in relation to selling discounts for No. 2 Northern. The narrowing of selling

discounts for No. 4 Northern Wheat, No. 5 and No. 6 Wheat, reflected the decreasing quantities of wheat of these grades which could be offered by the Board.

The following table shows quoted discounts under No. 1 Northern for principal grades of wheat on August 1, 1959, February 1, 1960 and July 31, 1960 (basis in store for William/Part Arthur):

	No. 2 Northern	No. 3 Northern	No. 4 Northern	No. 5 Wheat	No. 6 Wheat
	(cents per bushel)				
August 1, 1959.....	-3	-13	-23	-26	-27
February 1, 1960.....	-3	-10	-15	-18	-20
July 31, 1960.....	-5	-9	-14	-19	-21

The CHAIRMAN: Are there any questions, gentlemen?

Mr. KORCHINSKI: With reference to the price asked at Churchill in comparison with the price asked at Fort William, does the exchange rate make any difference in the policy, or any difference in the prices?

Mr. McNAMARA: No.

Mr. KORCHINSKI: I note that during the shipping season 1959, the average price strengthened during November to February and declined for the month of March. How could that be?

Mr. McNAMARA: This is related to the fluctuation of the dollar.

Mr. SOUTHAM: May I refer back to the general comments on marketing of wheat? I noticed that on page eight the United States exports in the category of relief shipments in 1959-60 were 373 million bushels. Would Mr. McNamara comment on the effect of that on the overall exports?

Mr. McNAMARA: It was a substantial part of their exports. I think later we show that in commercial area the United States only sold 134 million bushels. They sold it in competition with us in the commercial market, whereas the 373 million bushels—for lack of a better expression—I term as “give-away” wheat.

Mr. SOUTHAM: If they had not invaded the markets then there would otherwise not be that difference?

Mr. McNAMARA: No. I think in fairness to the Americans I should say that we are working very closely with them. We do have some points of disagreement, but generally they are trying to direct their disposal program into the non-commercial field. Their heavy exports this year will be concentrated in areas of that kind.

Mr. HORNER (*Acadia*): That is the 373 million bushels, and the Canadian counterpart is the 8.6 million, which is given by way of direct gift, in a sense?

Mr. McNAMARA: That is right.

Mr. HORNER (*Acadia*): Do the Americans not receive something in return for this 373 million bushels?

Mr. McNAMARA: Yes, with some of their programs they get local currency, but this local currency must be utilized in the country of distribution for various projects.

Mr. HORNER (*Acadia*): For defence, or something like that?

Mr. McNAMARA: Yes.

Mr. HORNER (*Acadia*): So actually, to compare the two does not really make a true comparison in a sense?

Mr. McNAMARA: No. Under our Colombo plan the 8 million is more or less free, although I think there are counterpart funds made available to Canada under the Colombo plan for various projects. But there is very little similarity to the American proposals which are straight give-aways; most of this comes under title four, where they receive local currency.

Mr. HORNER (*Acadia*): I was wondering, because it figured out that each Canadian was giving only one half a bushel, roughly, whereas each American would be giving away two bushels apiece. Are they more generous than we, or is that a proper way to compare it? I thought that perhaps they were getting back more.

Mr. McNAMARA: I do not think it is because of generosity. We have our various programs of commercial selling, and of assistance, for which we receive from the government credit facilities, and thus we are rapidly reducing our surplus position. In fact, I am quite concerned with the present development of the new crop, because I think that in certain grades we may be embarrassed by lacking supplies in the coming year. But as I indicated earlier, the Americans are not making any progress in it, as may be seen from the fact that their carry-over at the end of the crop year will be the largest in history. I do not think it is because of their being any more generous. They simply cope with the problem in a different way, and they have not met with the success that Canada has had in reducing our surplus.

Mr. HORNER (*Acadia*): I just wondered.

The CHAIRMAN: If there are no further questions, let us pass on to "durums".

Mr. EARL:

DURUMS

The following table shows monthly average Board asking prices for No. 1 C.W. Amber Durum Wheat basis in store Fort William/Port Arthur:

No. 1 C.W. Amber Durum
Monthly Average Asking Prices
Fort William/Port Arthur

	High	Low	Average
	(cents per bushel)		
August, 1959.....	182 $\frac{1}{2}$	180 $\frac{5}{8}$	181 $\frac{3}{8}$
September.....	181 $\frac{1}{2}$	175	180 $\frac{1}{2}$
October.....	175 $\frac{3}{8}$	174 $\frac{3}{4}$	175 $\frac{1}{2}$
November.....	176 $\frac{5}{8}$	174 $\frac{7}{8}$	175 $\frac{5}{8}$
December.....	178	175 $\frac{5}{8}$	176 $\frac{5}{8}$
January, 1960.....	178 $\frac{3}{8}$	177 $\frac{1}{2}$	178
February.....	177 $\frac{5}{8}$	177 $\frac{1}{2}$	177 $\frac{3}{4}$
March.....	177 $\frac{1}{2}$	175 $\frac{5}{8}$	176 $\frac{1}{2}$
April.....	178 $\frac{5}{8}$	176 $\frac{1}{2}$	177 $\frac{7}{8}$
May.....	180 $\frac{1}{2}$	178 $\frac{3}{8}$	179 $\frac{3}{4}$
June.....	180 $\frac{1}{2}$	179	179 $\frac{1}{2}$
July.....	179 $\frac{5}{8}$	176 $\frac{1}{2}$	178 $\frac{5}{8}$

Asking prices for Durum grades of wheat declined during 1959-60. In late September Board asking prices for No. 1 and No. 2 C.W. Amber Durum Wheat declined by 5 cents per bushel, and No. 3 C.W. Amber Durum and Extra No. 4 C.W. Amber Durum declined by 3 cents per bushel. During the balance of the crop year Board asking prices for Durum grades of wheat increased slightly. The general effect of Board pricing of Durum grades of wheat was to narrow the spread between top grades of Durum as compared with No. 3 C.W. Amber Durum and Extra No. 4 C.W. Amber Durum.

The CHAIRMAN: Are there any questions?
If not, let us pass on to "tough and damp grain".

Mr. EARL:

TOUGH AND DAMP GRAIN

As a result of the unfavourable 1959 harvest the Board received from producers a total of 79.1 million bushels of tough and damp wheat, oats and barley. Of this quantity of grain, 49.5 million bushels were tough and 29.6 million bushels were damp.

During the winter months, and extending until late in the crop year, extensive drying operations were carried out at Pacific Coast ports, at the Lakehead and at interior terminal elevators. To the end of the crop year, 51.9 million bushels were artificially dried. Of this quantity, 21.3 million bushels were dried at the Pacific Coast, 27.4 million bushels at the Lakehead and 3.2 million bushels in interior terminals.

Commencing in early November, it was necessary to move substantial quantities of high moisture content grain to Pacific Coast ports. While this movement was taking place and extensive drying operations were underway in Pacific Coast terminal elevators, delays occurred in loading ocean vessels and substantial demurrage charges were incurred during the January-March period. Throughout this difficult period exports from Pacific Coast ports remained at a high level.

January was a most difficult month, but actual export clearances amounted to 14 million bushels as compared with 17 million bushels in January of the previous year. In February, loadings were 16 million bushels as compared with 17 million bushels in the previous year. In March, loadings were 16 million bushels as compared with 15 million bushels in the previous year.

The CHAIRMAN: Are there any questions?

Mr. HORNER (*Acadia*): What do you call a substantial demurrage charge?

Mr. McNAMARA: We have a figure here, and I think it is in the neighbourhood of $\frac{1}{2}$ million.

Mr. HORNER (*Acadia*): Is this demurrage for boats or for box cars?

Mr. McNAMARA: It is for boats waiting for cargo.

Mr. HORNER (*Acadia*): Is there a line-up to get into the docks, or why would they put a charge on boats particularly?

Mr. McNAMARA: When a boat is chartered, a certain number of days are specified in which it has to be loaded, and failing that demurrage is assessed. These boats "presented", and were ready to load, but we were not in a position to load them. Therefore we were responsible for the demurrage until we were ready to load. The demurrage will vary of course with the size of the vessel and it may run from \$1,000 to \$1,500 per day.

Mr. HORNER (*Acadia*): The wheat board had to pay the demurrage because they were not in a position to load the boats?

Mr. McNAMARA: That is right. We will get that for you.

Mr. HORNER (*Acadia*): You say about half a million?

Mr. McNAMARA: Yes.

Mr. HORNER (*Acadia*): This is close enough.

Mr. McNAMARA: It is \$431,853.

Mr. KORCHINSKI: Who determines the amount of the demurrage charge per boat?

Mr. McNAMARA: The vessel owner and the exporter who charters the particular boat. If we sell it f.o.b., the boat is chartered by the buyer; but if it is c.i.f., it is chartered by our exporter.

Mr. HORNER (*Acadia*): This is mainly because of the drying operations.

Mr. MCNAMARA: Yes. We could not get the grain in condition to meet shipments.

The CHAIRMAN: We will now go to the St. Lawrence seaway.

Mr. EARL:

THE ST. LAWRENCE SEAWAY

The Annual Report of the Canadian Wheat Board for the crop year 1958-59 outlined the objectives of the Board in its use of the St. Lawrence Seaway and the policies which came into effect in advance of the opening of the Seaway in the spring of 1959.

This was accomplished by the Board increasing its Lakehead selling prices by the amount of the saving which it felt would accrue in the all-water movement of wheat to St. Lawrence ports as compared with the fixed differential which had been in effect prior to the close of navigation in 1958. Throughout the crop year 1959-60 the Board was successful in retaining for western producers the saving which was envisaged prior to the opening of the Seaway.

It was pointed out in the Annual Report of the Board for 1958-59 that the ultimate saving in costs will depend in part upon the volume of grain which moved exclusively by the all-water route through the Seaway and the volume of grain which is moved to Georgian Bay ports and thence by rail to St. Lawrence or Maritime Atlantic ports.

For the period from August 1, 1959 to July 31, 1960, export wheat moved from Fort William/Port Arthur to St. Lawrence ports as follows:

<u>All-water Via</u>		
<u>All-water Direct</u>	<u>Transfer Elevators</u>	<u>Lake and Rail</u>
	(million bushels)	
28.3	30.8	15.7

In the case of grain for export through Maritime Atlantic ports the movement was as follows:

<u>All-water Direct</u>	<u>Lake and Rail</u>
	(million bushels)
1.4	16.1

In the movement of export wheat from the Lakehead to St. Lawrence ports within the crop year 1959-60, 79 per cent of the movement was via all-water route, either direct to St. Lawrence ports or via transfer elevators. The balance of the movement was by lake and rail and constituted 21 per cent of the total movement.

In the case of the movement from the Lakehead to Maritime Atlantic ports, the main part of the movement must be by lake and rail because of the limited storage capacity available at Maritime Atlantic ports and the closing of the Seaway prior to the winter movement from Maritime Atlantic ports.

It should be pointed out that the foregoing statistics refer only to export wheat moved from the Lakehead between August 1, 1959 and July 31, 1960, and do not take into account Lakehead shipments prior to August 1, 1959 which reached eastern destinations within the crop year.

During the crop year, 7.3 million bushels of export wheat were cleared from Fort William/Port Arthur for direct shipment to overseas countries.

Mr. RAPP: In respect of the export of wheat and wheat flour, there are some very interesting statistics. For instance, France actually increased her purchases from Canada. They purchased more in 1959-60. I thought France was an exporting country.

Mr. McNAMARA: Most of these increased purchases were in Durum wheat.

Mr. RAPP: Then there is the Union of South Africa; how are the sales progressing this year?

Mr. McNAMARA: Very disappointing. South Africa has not bought any Canadian wheat for shipment.

Mr. RAPP: And we have practically lost all the sales to some of these Asian countries. Would the reason be that the United States is interfering by reason of their give-away programs?

Mr. McNAMARA: Are you referring, for example, to India?

Mr. RAPP: To Asia—India, Pakistan, Indo-China, Arabia. This is on page 14.

Mr. McNAMARA: Most of these sales to India and these other countries have been under the special aid programs, either Canadian sales under the Colombo plan or United States sales under their special programs. Neither India nor Pakistan have been buying any large quantities of grain on a commercial basis. When you refer to Asia I hope you are not overlooking the substantial increase this year.

Mr. RAPP: But these give-away programs have made quite an inroad into our commercial markets in Asia.

Mr. McNAMARA: It would be difficult to say whether India is a commercial market and whether she has the financial resources to pay for wheat. I would say that if the United States, and to a limited degree Canada, were not in a position to make wheat available to India under these special programs it would seriously retard the economic condition of that country. It is a great question whether she has the balance of payment necessary to pay for the food she is importing at the present time. So to say that the Americans have reduced our marketing potential in that area is difficult to argue, because it is difficult to say how much of the resources of India could be directed towards importing wheat from Canada.

Mr. MUIR (*Lisgar*): Would it not also be a fact that the countries who receive wheat under these various plans will eventually get to like the wheat more?

Mr. McNAMARA: We are hoping this will be the case. Certainly it has been the case so far as Japan is concerned. In the prewar period they were practically solely rice eating people and now wheat is an important part of their diet. We are hoping that with the programs in respect of the Asian and African countries we will build up more potential commercial markets for wheat.

Mr. MUIR (*Lisgar*): I suppose these questions really should come in later.

The CHAIRMAN: Yes. I was about to suggest that.

Mr. MUIR (*Lisgar*): Do you find that your overseas exports are increasing since the seaway was opened?

Mr. McNAMARA: You mean the movement out of the lakehead?

Mr. MUIR (*Lisgar*): Yes.

Mr. McNAMARA: Yes. There is a marked increase this crop year over the one we are dealing with now. Our water movement is almost doubled. From the opening of navigation this year we have moved direct from Fort William 5,954,000 bushels as compared to 8,000,700 for the whole of the previous year. There is going to be a substantial increase in the movement of all grains from Fort William to overseas markets.

Mr. SOUTHAM: And there is the fact that the seaway facilitates the handling in that you do not have to load into smaller boats and then into larger boats. This might cut down the demurrage charges and the cost of handling.

Mr. McNAMARA: Yes. We are getting the benefit of the all water route. It is pointed out in the preceding paragraph, however, that the movement by lake and rail is more expensive, and that movement through the Atlantic ports during the winter has to be serviced by the railways. These charges are being absorbed. We are quite concerned by the application of the railways to increase the rail rates to the maritime ports. As I pointed out to the royal commission on transportation some time ago, these increased charges will pretty well price our maritime ports out of the export market. If these increases are allowed by the government, it is going to force the board to seriously consider using some of the United States outlets for the winter movement rather than our own maritime ports.

Mr. SOUTHAM: I think this is a point that should be very much emphasized, because it will result in a higher net to the farmer and, after all, that is what the farmer is after, in the long run.

Mr. EARL:

INTERNATIONAL WHEAT AGREEMENT

The crop year 1959-60 coincided with the first year of the international wheat agreement which became effective on August 1, 1959. As at the date of this report, 43 countries were participating in the agreement, 34 importing countries and 9 exporting countries. The territories of the United Kingdom, The Netherlands and Portugal, to the number of 47, also participated in the agreement. The following table shows registrations of commercial sales of wheat and flour recorded by the international wheat council in 1959-60:*

<i>Exporting Countries</i>	<i>Quantities (bushels)</i>
Argentina	67,177,796
Australia	79,071,465
Canada	233,930,303
France	33,045,303
Italy	9,385,479
Mexico	—
Spain	516,286
Sweden	1,930,052
United States	130,670,458
TOTAL	555,727,142

*Subject to revision.

It will be noted that a total of 555.7 million bushels of commercial wheat sales were registered by the Council during the crop year under review. Registration of commercial exports of Canadian wheat amounted to 233.9 million bushels.

SALES—1959-60

During the crop year 1959-60 board sales of wheat were as follows:

	Total Sales (bushels)
Domestic	78,629,167.8
Export sales at Class II prices	18,101,639.0
Export sales under the terms of the International Wheat Agreement	253,204,593.1
Weight losses in transit and in drying	1,941,891.6
TOTAL	<u>351,877,291.5</u>

As shown by the above table board sales of wheat amounted to 351,877,291.5 bushels, of which 224,578,162.9 bushels were applied to the 1958-59 pool account and 127,299,128.6 bushels were applied to the 1959-60 pool account.

Mr. MUIR (*Lisgar*): When was the 1958-59 pool account closed?

Mr. EARL: May 20, 1960.

EXPORTS

The following table shows exports of wheat (including flour), by months, for the crop year 1959-60:**

August, 1959	24.4	149.8
September	25.6	
October	26.2	
November	32.8	
December	24.3	
January, 1960	16.5	149.8
February	20.1	
March	20.6	
April	19.7	
May	25.1	
June	24.4	
July	17.6	127.5
TOTAL		<u>277.3</u>

**Source: Board of Grain Commissioners for Canada. Includes exports of Ontario Winter Wheat. Exports of bagged seed wheat are included.

Wheat exports (including flour) amounted to 277.3 million bushels as compared with 294.3 million bushels in the previous crop year. The export movement was at a relatively high level during the first half of the crop year when exports amounted to 149.8 million bushels. In the second half of the crop year exports were well maintained in the February-April period but declined in the May-July period as compared with the previous crop year. Exports during the last half of 1959-60 amounted to 127.5 million bushels.

* Source: Board of Grain Commissioners for Canada. Includes Exports of Ontario Winter Wheat.

The CHAIRMAN: Are there any questions?

Mr. MUIR (*Lisgar*): How do they compare with exports for this crop year?

Mr. McNAMARA: We are substantially ahead. Already, we are in excess of 300 million bushels. I would hesitate to put a final figure, because a lot will develop in connection with boats during the next five weeks. I notice that it was estimated by one of my colleagues, Mr. McConnell, the other day as being around 340 million bushels. However, I think it will be higher than that.

Mr. SOUTHAM: Could you give us an idea what we would anticipate in so far as export sales of Durum to Italy this year are concerned?

Mr. McNAMARA: It is difficult to say; however, I think, with the exceptionally heavy demand for Durum that has prevailed during this crop year, that it will continue for at least a portion of the next year. There are practically no supplies of Durum wheat available in the world today, and the importing countries are bidding for Durum and looking for subsidies for Durum, and I am hoping we will have good, keen demand for Durum continuing into the next crop year. I was a little disappointed at the Durum acreage. At one time we forecast an increase of about 70 per cent; however, on account of the drought, I do not think that the volume of the Durum will be so high. With the present condition of the Durum crop I would say that I do not anticipate that we will have any difficulty in marketing all the Durum which will be produced.

Mr. SOUTHAM: I just wondered, in that connection, because the farmer did experience a great sense of satisfaction in that market developing, and they were wondering what the prospects were for the future.

Mr. McNAMARA: Our normal Durum exports are running in the neighbourhood of 17 million bushels a year; the previous year we exported 22 million, and this year it will be in excess of 40 million. I would like to have seen a somewhat larger Durum production this year, say in the neighbourhood of 25 million or 30 million. I do not think now, with the condition of the new crop, that we will experience any difficulty in marketing all the Durum for this year.

In connection with what our policy will be in regard to quotas, I would not like to forecast; however, under the present conditions, I think that we will be opening the quota on Durum and that probably we will be taking all Durum off the farms as fast as available, in order that we may take advantage of the continuing demand for Durum while it still exists.

Mr. SOUTHAM: Has this increase sales in top quality wheat on the world markets and the prospects of lower production this year had any strengthening effect of the general over-all tone of the market?

Mr. McNAMARA: We strengthened our prices to a degree. However, the effect of the world situation is that although the Canadian position has improved substantially, the over-all supply of wheat in the world is still the largest on record. At the end of the crop year there will be more supplies available than at any time in history, as the result of which it is pretty difficult to influence buyers to pay a higher price, in view of the large supplies available.

Mr. MUIR (*Lisgar*): Has no one tried to export quick bread flour—say, a quick mix?

Mr. McNAMARA: Do you mean like that mix which Ellison makes at Lethbridge?

Mr. MUIR (*Lisgar*): I am referring to this product which you just mix with milk or water and make your loaf of bread.

Mr. McNAMARA: They do in different cake mixes, but not in connection with bread wheats. There are various reasons for this. I think it is more expensive to manufacture it and ship it from Canada. However, the various regulations within the importing countries in connection with the use of their own indigenous wheat prevents their mills and bakers from using a lot of these products. For instance, in Belgium, the Belgian millers must use 70 per cent of the Belgian crop in their gristing. This makes it difficult for them to import ready mixes or Canadian flour unless it is blended with the flour they produce.

Mr. MUIR (*Lisgar*): Do you have any overseas facilities available—and I am thinking now more of the people who are just taking up the eating of bread—for trying to sell the idea of eating bread?

Mr. McNAMARA: Well, yes. Of course, we have the benefit of the Canadian grain trade which acts as our agents, and these firms are getting into all important markets of the world and pushing our products. Our mills are represented, and we have flour salesmen abroad. There are trade commissioners; the Department of Trade and Commerce represent us in all our important markets, and they are working very closely with us in promoting the sale of Canadian wheat and flour. In addition to this we have encouraged within the last year a technical service within the board, working in co-operation with the board of grain commissioners through the respective departments of agriculture and trade and commerce. We now have the services of the assistant chief cereal chemist, Dr. Irving, who is spending full time in promoting technical service of this kind. We are recruiting personnel. These will be trained technicians who will visit these markets, expounding the virtues of Canadian wheat and trying to educate millers and others how it can be handled and blended to the best possible advantage.

Mr. MUIR (*Lisgar*): That is the type of thing to which I was referring. What facilities do these newer countries have for receiving our wheat? Does it have to be sacked?

Mr. McNAMARA: It varies. Most of them are in a position to handle grain in bulk. Some of the markets still require it sacked. The great preponderance of the shipments to China are in bulk, as well as to Japan.

Mr. MUIR (*Lisgar*): Would there be any advantage in this government helping to build elevators, say in Ghana or some of the other smaller countries?

Mr. McNAMARA: No, not if the purpose of it is to carry Canadian wheat unsold to these countries. It is a very poor type of merchandising to have any grain that is not priced in the hands of the buyer. He starts dictating the price, as a result of which you are at his mercy. I would not suggest that. I think the place to keep the unsold wheat is in Canada where we are free to move it to a market which might develop.

Mr. MUIR (*Lisgar*): Probably the same thing applies to eastern Canada, then. You do not have to answer that question.

Mr. SOUTHAM: In connection with our wheat sales, now that we have brought the Canadian wheat board under the jurisdiction of the Department of Agriculture, has it helped you in the over-all solicitation of world markets?

Mr. McNAMARA: No. In fairness to trade and commerce, I would not say it has helped us, but still it has not hindered us. I had some apprehension because I was afraid it might mean that we would lose the very valuable assistance we got from the trade commissioners in all parts of the world. But my anxieties were dissipated very rapidly, because it was immediately announced by the Prime Minister that although we were transferred to agriculture, we would still have the active cooperation of all the trade commissioner service; and certainly the Minister of Trade and Commerce and his officials are just as close as they have ever been to us, and are giving us the same assistance we had before, so it has not affected our position in merchandising abroad.

Mr. SOUTHAM: I am glad to hear you say that because I was wondering how it worked out.

Mr. KORCHINSKI: In trying to attract sales, do you conduct practical demonstrations of milling and baking, for example?

Mr. McNAMARA: Some of it is done, but not extensively. The regulations of most importing countries as to the percentage of their wheat which must be

used in their local grist makes it difficult for us to demonstrate to them just what could be accomplished by the use of more Canadian wheat; because it is really unfair to the millers who are the buyers of our wheat, to demonstrate a product which could be turned out by using more Canadian wheat, when they are being forced by their own country's regulations to use a larger percentage of their indigenous wheat. But our export trade is very active in this field, and they co-operate with the trade and work as our agents. As I mentioned earlier they are active in every market of the world through their agents, and they are continually explaining and expounding the virtues of Canadian wheat to these potential buyers. Moreover, I think our record of selling in the commercial markets of various countries as compared to that of the United States will show that we are outselling the Americans at a rate of 2 to 1 in commercial markets. I think this is an indication of the efforts we are making, and of the assistance we are receiving from the Canadian grain trade, as well as the valuable assistance we are receiving from our trade commissioners abroad.

Mr. KORCHINSKI: It is a matter of selling and of educating buyers on the merits of our product.

Mr. McNAMARA: That is right.

The CHAIRMAN: We are now on page 15, at the bottom of the page.

Mr. EARL:

Exports of wheat and flour to Europe were 169.2 million bushels as compared with 188.4 million bushels in the previous crop year. The reduction was due to the exceptionally large wheat crop harvested in Western Europe in 1959 and the consequent reduction in import requirements of the area, particularly noticeable in the case of the United Kingdom and the Federal Republic of Germany. In addition, the U.S.S.R. did not purchase Canadian wheat within the crop year 1959-60. France increased imports of Canadian wheat in spite of being a large exporter in 1959-60.

Exports to African countries increased by nearly 2 million bushels, largely as a result of increased purchases by Algeria. Exports to the Union of South Africa were 6.7 million bushels as compared with 7.6 million bushels in the previous crop year. Exports were well maintained to the smaller importing countries of Africa.

Japan was the principal market for Canadian wheat in Asia. Japanese imports of Canadian wheat were a record 46.8 million bushels as compared with 42.1 million bushels in the previous crop year. Exports to India, Pakistan and Ceylon were smaller due to reduced shipments under government aid programmes. There was a sharp increase in exports to the Philippines, and Iraq purchased 2.5 million bushels during the crop year. Government aid programmes included small shipments to Indonesia, Burma and Indo-China. Exports to Israel increased slightly.

Exports to South American countries were 8.9 million bushels as compared with 7.2 million bushels in the previous crop year. The increase was due to larger exports to Peru, Colombia, Ecuador and British Guiana. Chile received Canadian wheat under an aid programme following the disastrous earthquakes in that country.

Principal exports to Central America and the Caribbean Area were in the form of wheat flour. Trade was well maintained in the area as a whole during the crop year.

Exports of wheat to the United States for milling in bond declined, but exports of wheat and flour for domestic use in the United States declined only slightly from the levels of the previous crop year.

Exports of bagged seed wheat were 5.6 million bushels as compared with 5.0 million bushels.

The CHAIRMAN: Are there any questions?

Mr. HORNER (*Acadia*): You say here that our exports to Europe are down. Is that situation continuing in this current crop year, or have we regained some of this loss?

Mr. McNAMARA: Yes, we have regained more than we lost in most of our important markets.

Mr. HORNER (*Acadia*): And does the same hold true with respect to Japan?

Mr. McNAMARA: We are doing better with Japan. Our exports to Japan will be well in excess of 50 million bushels this year. We are doing better with Japan this year.

Mr. SOUTHAM: I am glad to hear about this increase.

Mr. McNAMARA: Yes, we are doing very, very well.

The CHAIRMAN: To what principal countries do we export seed wheat?

Mr. McNAMARA: This seed wheat is registered certified wheat, and it is outside of the control of the Canadian wheat board. As a rule we do not allow it to be exported in the commercial market where it competes with our commercial wheat. But there are a few markets; the main one is Saudi Arabia, where they prefer their wheat soft; they do not mill it, but they eat it in the form of chappatis, and they prefer our registered seed wheat because it is clean. So rather than lose that market we allow this registered seed to move into it. There are one or two other markets, but Saudi Arabia is the main one.

Mr. RIDDEL: Yes, there is Saudi Arabia, the Persian Gulf, Portugese Goya, and one or two small countries; and we did allow some of this to go to Colombia in South America this past year, because we did have a surplus, and there was no other way we could supply them in competition with American grain.

Mr. HORNER (*Acadia*): It has been said at other meetings that Russia imports wheat from Canada, and that this wheat goes to the eastern edge of Russia, for example, north of Manchuria and in that area.

Mr. McNAMARA: That is right.

Mr. HORNER (*Acadia*): And the reason Russia imports it is because of the difficulty of bringing their own wheat to the uttermost eastern edge of their country. Would that be a reasonable assumption?

Mr. McNAMARA: Yes, and before I continue to answer, I would like to say that when I was speaking about the sale of seed wheat, I should have said that the United States constitute the largest market for registered certified seed to be used as seed wheat. The other markets I was referring to had to do with the use of this seed wheat for human consumption.

Mr. SOUTHAM: I was going to ask you about the large number of American farmers who in recent years have been crossing over the line and coming into Canada around my area, for the purpose of growing seed grain to create registered seed. May I ask how much registered seed has been exported from that area? I refer to my own area, of course? I ask this question because it has been a topic for considerable discussion among agricultural people in that particular area of Canada.

Mr. McNAMARA: You want to know the quantity of registered seed exported?

Mr. SOUTHAM: I mean the quantity exported by American farmers coming up to Canada and leasing land in our area. That is how they get around the export quotas.

Mr. McNAMARA: No, they must have a permit. We do not allow the export of seed without a permit which is issued by the Canadian wheat board.

Mr. SOUTHAM: Have you any figures to indicate how much export seed was coming out of that area?

Mr. McNAMARA: Yes, we can get the figure for you; we shall try to get it for you. Now, coming back to Mr. Horner's question about Russian wheat, the Russians have advised us—and I have talked with them both in Russia as well as in Canada on several occasions—that the wheat they are purchasing from Canada is mainly used to service this Vladivostok area that you referred to. They point out, as we point out to them, that it is good business to take this wheat from Vancouver and to ship it by boat, rather than to transport it by rail all across northern Russia. They accept this premise, A few years ago some of their wheat did go into Europe, and I think was used to provide eastern Germany with some of its requirements. Last year Russia again picked up 200,000 tons, and this was on a movement to the Vladivostok area. Only one cargo has to be delivered to complete those shipments, and early in the fall when I met some of the Russians in Europe, they advised me this wheat was again going in the Vladivostok area but I believe there is a possibility this year Russia may divert some of this wheat to East Germany.

I may add that recent reports we have received from our trade commissioners indicate the Russians are now considering making 300,000 tons of wheat, flour are rye available to China, and it is possible they might divert some of these last Canadian shipments to China.

Mr. HORNER (Acadia): I suspect this would be more or less as a gift?

Mr. McNAMARA: Yes.

Mr. HORNER (Acadia): If Russia feels it is cheaper to ship wheat from Canada rather than haul it from the interior of Russia, they might feel the same thing about selling wheat to Japan.

Mr. McNAMARA: They have tested the Japanese market. A few cargos of Russian wheat were sent to Japan but, fortunately for us, the quality of the wheat did not impress the Japanese millers, and we hope this will continue.

Mr. HORNER (Acadia): Was this because of foreign material in the wheat or because of the quality of the wheat?

Mr. McNAMARA: The quality of the wheat was not good.

Mr. KORCHINSKI: While we are supplying wheat from Canada to the Vladivostok area, on the other hand the Russians are using their wheat and selling it on overseas markets where we are competing.

Mr. McNAMARA: I think that is right.

Mr. KORCHINSKI: Therefore, we might not be gaining anything by it?

Mr. McNAMARA: The supplies Russia has available for the European markets, such as Belgium and Holland, are surplus and she would be active in these markets anyway. I do not think we are increasing the volume of Russian exports to Holland and Belgium, by selling wheat which is going to Vladivostok. Anyway, the quantity we send is small in comparison to the total she produces.

Mr. MUIR (Lisgar): You said you were shipping registered wheat to Saudi Arabia for human consumption? What price do they pay for that?

Mr. McNAMARA: They negotiate this direct with the trade and with the wheat growers. The reason we control this movement is that a few years ago we found that registered and certified seed was being offered on the commercial market at prices below our commercial prices. Producers were taking a lower price than board prices, in order to get the additional delivery privileges. We were starting to compete with ourselves by reason of this wheat being offered at very attractive prices below our prices, and that is why we do not allow it now to go into the commercial markets.

There is also another factor which must be considered. Mr. Riddel referred to the experience we had last fall when we allowed some surplus registered wheat to go to Colombia. My colleague, Mr. Robertson, has recently returned

from there and I think he can tell you a lot more about it. I think we shall take a very close look at this before allowing it to happen again. They bought No. 2 seed, which does not compare with our No. 2 or No. 3 Northern, and the person who bought this wheat was very disappointed with its quality when it was delivered to him. In fact, I think it would have a very adverse effect on our future prospects.

Mr. ROBERTSON: There was a variation in the seed. Number two seed might be equal to No. 2 Northern wheat, but the next sack might be No. 3 Northern, and if you get No. 3 seed you would be very disappointed. One miller got good seed, another got poor seed, and some of them wanted to send seed back because it was below what they expected to get from Canada; and this caused difficulty down there.

Mr. MUIR (*Lisgar*): Is the seed which goes to Saudi Arabia bagged, sealed and tagged?

Mr. McNAMARA: Yes.

Mr. MUIR (*Lisgar*): I may be wrong, but I believe the American regulations state that wheat seed exported to the States must also be treated?

Mr. McNAMARA: Yes, that is an American import regulation.

Mr. KORCHINSKI: Is it possible that some countries might be interested in seed wheat of a type or variety which we do not produce here? There may be a small market for a different variety best suited to their conditions, and we are not producing that.

Mr. McNAMARA: In cases where we have an assurance from the importing government that it wants to purchase Canadian seed for seeding purposes or breeding stock, we give authorization for such a movement as that. It is only when it is for human consumption that we control it.

Mr. KORCHINSKI: I was thinking of a potential market for a variety of grain which we are not producing here at the present time.

Mr. McNAMARA: I do not think I am competent to answer that. This would be handled by the seed growers' association and the plant products division of the Department of Agriculture, under which our whole program of seed selection is organized. I understand there is quite a wide exchange of varieties between various countries. A great exchange of seed information is always taking place.

Mr. KORCHINSKI: You are not aware of anywhere we are losing sales because of the fact that we are not able to supply a particular variety of grain?

Mr. McNAMARA: We have lost business this year because we did not have larger volumes of lower grade wheat. Some of this demand was concentrated in countries where quality is not required to the extent that it is required in the United Kingdom and Germany. If we had a larger volume of heavy frosted No. 5, I think we could have increased our exports this year. I have seen some suggestions that we should try to grow this quality of wheat, but that is not the solution to our problem. The thing which we have in Canada, and which no one else has, is quality, and I hope we shall always keep our sights directed on high quality. When we get into the production of low quality, then ours is no better than anyone else's and it will be very difficult to sell it on overseas markets.

Mr. KORCHINSKI: I was thinking primarily of seed wheat.

Mr. PASCOE: I wonder if Mr. McNamara has any comments to make on the Trail, B.C. charter deal, incorporating 10 million bushels of wheat for lead?

Mr. McNAMARA: I do not know too much about that, but it could be American wheat which would be going to a third country of destination.

The report indicated it would be coming back into Canada, but I can assure you that is not so.

The CHAIRMAN: We shall now go on to wheat exports by ports.

Mr. EARL:

WHEAT EXPORTS BY PORTS*

Exports of wheat (including Ontario Winter Wheat) through eastern Canadian ports amounted to 108.4 million bushels, of which 84.0 million bushels were shipped through St. Lawrence ports and 24.3 million bushels through Maritime Atlantic ports. Pacific Coast clearances of wheat were 95.1 million bushels, and shipments from Churchill amounted to a new record of 21.7 million bushels. Shipments of wheat to the United States were 2.1 million bushels. Direct shipments of wheat from Fort William/Port Arthur to overseas destinations were 7.3 million bushels.

*Source: Board of Grain Commissioners for Canada.

Mr. HORNER (*Acadia*): I imagine you keep a close watch on the development of overseas ports? I notice recently Belgium has enlarged its main port by providing additional facilities for handling wheat. In fact, I believe they can now handle something like 3 million bushels a year. Am I right?

Mr. McNAMARA: Yes. One of the grain firms asked the port authorities in Antwerp to increase their storage capacity substantially.

Mr. HORNER (*Acadia*): That would lead one to believe they are going to import wheat for some time yet?

Mr. McNAMARA: This is true.

Mr. HORNER (*Acadia*): This is within the centre bloc, and I just wanted to mention it.

Mr. KORCHINSKI: What are you setting your sights at for the port of Churchill this year?

Mr. McNAMARA: We are setting our sights at all the wheat we can get out of Churchill. We have no roof. To answer your question, however, I would think that the movement out of Churchill this year will correspond to the movement last year very closely. I have explained that there is a definite limit as to the volume of wheat that the western Europeans will purchase during that particular period of time. If we try to force a larger quantity of wheat out of Churchill into those markets we will not only saturate the market but it will probably have the tendency of lowering the whole general price structure in that area. I think you will find that this year our sales are about the same as they were at this time last year. We are still offering further wheat for shipment from Churchill at a later part of the Churchill shipping season, and we will end up very close to last year's figures.

On this point, this question of utilization of ports, you might be interested in information I have here regarding the movement this year to date from various outlets as compared with the same last year. On the Pacific coast—this is all grains, excluding rape seed, from August 1 to June 14—this year we have exported a total of 133.6 million bushels as compared with 120.9 last year.

From Churchill last year we had 19.1 as compared with 21.3 the previous year.

From the St. Lawrence ports we moved 114.3 as compared with 97 at this time last year.

Out of the maritime ports during the winter we moved 34 million, as compared with 25.4 last year.

In the United States we have moved 13.2 as compared with 18.8 last year.

The total movement of Canadian grain exported from August 1 to June 14 this year amounted to 347.8, as compared with 315.8 last year. Of course, in the final month of the crop year this comparison was even more favourable than it was last year. There is going to be a substantial increase in all our movements, except out of Churchill, this year.

MR. KORCHINSKI: Even with the improved facilities at Churchill you could not possibly expect too great an increase in shipments in the future, is that correct?

MR. McNAMARA: I do not think so. It is not a case of what we can deliver and what we can ship. It is what we can sell and what the customers can absorb in that particular period of the year. Churchill shipments, while very beneficial to us, price-wise, do have the effect of retarding our shipments on the St. Lawrence during the period that Churchill is open, with the result that we have difficulty in moving grain in volume out of the St. Lawrence ports during August and September in competition with our Churchill movement.

MR. KORCHINSKI: Would there be any advantage gained in having another terminal somewhere on the east coast? There has been talk of setting up a terminal in Newfoundland, trans-shipping wheat from Churchill into that port.

MR. McNAMARA: This is not practical at all. I was advised by the Baie Comeau people that the additional cost involved would make it impracticable; the extra handling and additional freight to Newfoundland would compare unfavourably with the freight we now pay to the United Kingdom. It would be a duplication of the freight from Newfoundland to its destination. I do think any advantage that we now get as a result of Churchill sales would be lost on such a movement.

MR. KORCHINSKI: So that all the advantage gained on the savings earned now would be nullified?

MR. McNAMARA: In that particular part of the movement.

MR. HORNER (*Acadia*): Concerning this port at Baie Comeau where the Americans built the elevator, what was the trouble? Why did it not operate last winter, in your opinion? I was told it was not too successful.

MR. McNAMARA: The company that built that terminal, Cargill, of course is a Canadian company. They are affiliates of the American parent company, but there were some construction difficulties which they ran into, a number of bugs in getting the elevator to operate. While they contended during the period of construction that it would be an all-winter port, there is some doubt now in their minds as to the feasibility of operating it during the winter on account of currents. That was information made available to me second-hand by some of their competitors.

The question now comes up as to whether it will ever be an all-winter port. Some of our traders are inclined to think it would be easier to keep the port of Quebec operating the year round than it would be to operate Baie Comeau, but harbour people are very resourceful, and it will be interesting to see if they do endeavour to operate it on a year-round basis. I doubt it.

MR. HORNER (*Acadia*): When it was first thought of, it was considered to be an all-winter port.

MR. McNAMARA: This was one of the features. However, do not discount the value of Baie Comeau just because it is not an all-winter port. It has been of substantial advantage to Cargill. They have been able to secure freight moving down to Baie Comeau at the same rate that wheat can be moved to Montreal on the water. We are assessing a premium of three-quarters of a cent

per bushel to Baie Comeau and have so far been able to secure this premium. Of course it has been of terrific benefit to the parent company, the American company, in the movement of American grain out of the St. Lawrence via Baie Comeau.

Mr. KORCHINSKI: This is rather difficult to understand. You told me that there is no advantage to be gained by setting up a terminal in Newfoundland. At the same time you are telling us that there is an advantage to be gained by trans-shipping it from the lakehead to Baie Comeau.

Mr. McNAMARA: I thought I explained it to you. Baie Comeau is operating on American movement, because they have never had an all-water route on corn, sorghum and soyabeans, that originated in the Lake Michigan area out of Chicago. This opened a completely new method of transport and it is of tremendous advantage to the Americans. The seaway has been an advantage to us because it has reduced costs in moving wheat to Montreal, but we always had some advantage of a water route even though we used to transfer at transfer points and put it on canalliers.

Mr. HORNER (*Acadia*): Is there not a two-way freight load going to Baie Comeau?

Mr. McNAMARA: The ore from Seven Islands goes there. These boats are taking grain to Baie Comeau. They go back to Seven Islands and pick up ore for Cleveland. It is quite a natural location in so far as the two-way movements on the lakes are concerned.

The CHAIRMAN: Utilization of special accounts,

Mr. EARL:

Section 29A of the Canadian Wheat Board Act provides that un-claimed balances in the hands of the Board which are six years old or more may, with the approval of governor in council, be transferred to a special account. The Act specifically sets forth that these funds shall be used "for such purposes as the governor in council upon the recommendation of the board, may deem to be for the benefit of producers."

From funds derived from the special account the board continued its policy of providing the opportunity for missions from important grain importing countries to visit Canada. The purpose of these missions is to enable visitors to see at first hand the methods employed in the production, handling, storing, milling and processing, and merchandising of western grain. Provision is made whereby visiting missions can inspect the Canadian elevator system and particularly the movement of western grain to seaboard and port facilities available in Canada. Members of missions may also explore special fields in connection with the marketing of Canadian wheat and wheat products. During 1960 four important missions came to Canada under this programme, as follows:

- (1) A mission from Japan consisting of five members and an interpreter. This mission represented the Japanese food agency and the milling industry of Japan.
- (2) A mission from India consisting of three members representing the ministry and the department of food.
- (3) A mission from Peru consisting of three members and an interpreter, and representing the flour milling industry of that country.
- (4) A mission from the Federal Republic of Germany consisting of four members. The mission was representative of the department of agriculture and forestry.

In arranging programmes for visiting missions, the grain trade in Winnipeg and elsewhere, and other interests in Canada, co-operated generously. The board would like to acknowledge the assistance of the following organizations in connection with missions: the board of grain commissioners for Canada, including the grain inspection branch and the research laboratory; the dominion laboratory of plant pathology, Winnipeg; the dominion laboratory of cereal breeding, Winnipeg; the plant products division, production services, department of agriculture, Winnipeg; the experimental farm services, Department of Agriculture, Ottawa; the Department of Trade and Commerce, Ottawa; the national harbours board, Montreal and Churchill; the provincial wheat pools in Calgary, Regina and Winnipeg; the United Grain Growers Limited, Winnipeg; the milling and baking industries, and the Canadian grain trade throughout Canada.

During the crop year the Institute of Baking and the Baking School of Japan opened its new laboratory, the equipment for which had been provided by the Board from the Special Account.

On September 23, 1959, the out-shore annex of the United Grain Growers Limited Terminal Elevator "A" at Port Arthur, Ontario, collapsed. The collapse resulted in the loss of 1,914,760.1 bushels of wheat, oats and barley valued at \$2,406,175.22.

The United Grain Growers Limited opened negotiations with the Board in regard to the loss and later consulted with the Government of Canada. Pursuant to these negotiations it was decided that the Special Account should be charged with a share of the loss in respect to wheat, oats and barley. The decision arrived at is set forth in Order in Council P.C. 1960-519, dated April 19, 1960. Under this Order in Council the Board recommended that, if the Governor in Council considered such payment to be for the benefit of producers, that the sum of \$775,000.00 should be appropriated from the Special Account for the purpose of paying part of the aforesaid loss resulting from the collapse of the elevator.

Mr. HORNER (*Acadia*): In regard to the wheat in the United Grain Growers' elevator, we are led to believe that it was in effect the property of the wheat board, or of the producers, which would mean the same thing.

Mr. McNAMARA: There was a difference of opinion between our solicitor and the solicitor of the United Grain Growers in regard to ownership. Mr. Monk can probably deal with this question better than I can. We took the view that they had issued the storage receipts and they were entitled to recover on the receipts. This was never decided by the courts. As this indicates, when it was referred to the government, the board recommended that if the governor in council considered that the payment was for the general benefit of our producers, then it should be paid out of our special account.

Mr. HORNER (*Acadia*): Would not the U.G.G. have it insured?

Mr. McNAMARA: Not for collapse. For fire, yes. This elevator collapsed; and that type of insurance was not covered by the terminal at that time.

Mr. HORNER (*Acadia*): Are they carrying it now?

Mr. McNAMARA: Yes. I understand that all of the terminals have been able to work it out now, and I think the majority of them have been able to cover that point.

Mr. HORNER (*Acadia*): This is the first time that that type of elevator accident occurred?

Mr. McNAMARA: Yes, to the best of my knowledge.

Mr. HOWE: How much money is in this special account now?

Mr. EARL: providing for the unexpended authorizations, the figure is \$678,459.44.

Mr. HOWE: That is paid out after the collapse of the elevator.

Mr. SOUTHAM: Would this be paid out of this special account, or would they ultimately be reimbursed from public moneys?

Mr. McNAMARA: No, it would be paid out of the special account.

Mr. HORNER (*Acadia*): In other words, it will come under the final payment, in effect?

Mr. McNAMARA: This special account is an accumulation which developed over the years when producer's certificates were not being presented by producers for payment, and it was transferred, under the provisions of our act, to the special account. It can now only be used for promotion work for the benefit of producers at large. It is to be used for these payments, in addition to these missions and promotional activities, and in addition to the new technical service to which I referred this morning. These are going to be financed out of the special account.

Mr. PASCOE: In regard to these missions, I know it is difficult to estimate the benefit of the missions, but would you say there are increased sales to Japan?

Mr. McNAMARA: I think it is the most effective sales promotion advertising work the board has been doing over the years. I know from the travelling I have been doing, and travelling quite extensively, as you know. In every country in which we have had a mission, we have had a number of new salesmen for Canadian wheat and Canadian products. I think this is the best promotional sales item of work we have undertaken, and we are going to continue and increase it this year.

Mr. PASCOE: In regard to this baking school in Japan, is it established in Japan?

Mr. McNAMARA: Yes. We provided the equipment on a basis of \$35,000. We made it available out of the special account for the purpose of this baking school, for the purpose of exhibiting what can be done with Canadian wheat.

Mr. PASCOE: With Canadian staff?

Mr. McNAMARA: No, the Japanese baking school provided the staff. We just provided the equipment.

Mr. RAPP: Last year arrangements were made by the Canadian wheat board so that western members could visit the Canadian wheat board headquarters and the board of grain commissioners and for some reason that visit never came off. Could similar arrangements be made this year?

Mr. McNAMARA: I hope they will. My recollection was that the invitation was extended, but not accepted by the members of the committee.

The CHAIRMAN: The invitation was extended to all members of the committee, but the committee had not been formed and was not constitutional.

Mr. McNAMARA: One of the members turned up. He was not advised of the cancellation.

Mr. RAPP: Could arrangements be made?

Mr. McNAMARA: Yes.

Mr. RAPP: This was made for the western members, and it would be very much appreciated if arrangements could be made again, so that we could have an opportunity to visit the Canadian wheat board, and the board of grain commissioners.

Mr. McNAMARA: I can assure you, Mr. Chairman, and Mr. Rapp, that we would welcome such a visit and it would be very beneficial for this committee, charged with the responsibility of studying our annual reports and considering

them, if they could spare the time to spend a day or so in Winnipeg. I would not say it would educate you, but I think you would find the information available in the offices of the board of grain commissioners, and in our offices. An inspection would be very interesting and would give you a better knowledge of the progress which we are making in our endeavours.

Mr. SOUTHAM: I might mention that Mr. McNamara happened to be referring to myself. Geographically I am only 240 miles from Winnipeg. It was a very enlightening visit. I spent the whole day there and I can assure the members that if they took the time they would certainly get a lot of worthwhile knowledge from it. At this time I would like to express my appreciation personally for the time they took to give information to this one-man mission.

The CHAIRMAN: I would not like the impression to go on the record that the invitation was extended only to the western members. I think all members received the invitation, and some members from the east were planning to go, including the chairman; but it was cancelled.

Mr. KORCHINSKI: With reference to the collapse of the terminal, with a loss of \$2.4 million, since the lawsuit, the authorities have paid \$775,000. Who instituted the lawsuit?

Mr. McNAMARA: United Grain Growers Limited.

Mr. NASSERDEN: In regard to these four missions in Canada, what was the cost of these missions coming to Canada?

Mr. McNAMARA: We can have that information from Mr. Earl, very shortly.

The CHAIRMAN: I hope the committee will be agreeable to adjourn when we have finished questioning on the items up to now.

Mr. MILLIGAN: Was any of this grain recovered?

Mr. McNAMARA: There was some salvage which United Grain Growers did get, but quite a substantial portion was destroyed when the grain slipped into the slips. While there was some salvage, there was also a heavy loss.

The CHAIRMAN: Mr. Earl will have the information when we convene again.

EVENING SITTING

MONDAY, June 26, 1961.

The ACTING CHAIRMAN (*Mr. Rapp*): Gentlemen, we have a quorum.

Mr. EARL: Mr. Chairman, three questions were asked before we adjourned, and I have the answers here. Mr. Korchinski wanted to know the quantity of wheat in store at off-site storage facilities. I have asked for the figure. And it is 4,836,735 bushels.

Mr. Southam asked how much seed wheat was exported from the riding of Moose Mountain. The Board records show a total of 117,026 bushels.

Mr. Nasserden asked the cost of the various missions to Canada during the 1959-60 crop year. The cost was \$24,844.

The ACTING CHAIRMAN: We will turn now to the next item.

Mr. EARL:

Other Promotional Activities

Early in 1959-60 The Honourable Gordon Churchill, Minister of Trade and Commerce, accompanied by Board representatives, again carried out a sales mission to the United Kingdom and the principal importing countries of Western Europe.

A mission representing the Department of Trade and Commerce and the Board spent some time in Africa in market development work. Included in the itinerary of the mission were Sierra Leone, Ghana, Nigeria, the Congo, Angola, Union of South Africa, Mozambique, Southern Rhodesia, Kenya, Sudan and Egypt.

Members and officers of the Board retained close contact with overseas wheat and flour markets. During the crop year members and officers of the Board visited the United Kingdom, Federal Republic of Germany, Denmark, The Netherlands, Belgium, Norway, Sweden, Switzerland, Poland, Czechoslovakia, France, Greece, Italy, West Indies and Japan.

The London and Rotterdam offices of the Board maintained close liaison with importing countries in Western Europe. During the year plans were established for opening an office in Tokyo, Japan, directed toward market development work in the Far East.

The Canadian Wheat Board film continued to circulate in most importing countries. The film is available in the French, German, Dutch, Spanish, Portuguese, Italian, Polish and Japanese languages.

The Board continued to distribute a brochure dealing with many aspects of western wheat and including samples of the principal grades western grain and flaxseed. This brochure has proved of interest to the import trade and the milling industries in overseas markets.

During the crop year the Board formulated plans to make available technical aid for the milling and baking industries in overseas markets. This programme will go into effect in 1960-61.

In the marketing of wheat and other grains the Board wishes to acknowledge the co-operation which it received from grain shippers and exporters, and the Canadian milling industry.

The Board also wishes to acknowledge the assistance which it received throughout the crop year from the Grain Division, Department of Trade and Commerce, and the Canadian Trade Commissioner Service. These agencies were very helpful in facilitating the marketing of Canadian wheat and flour.

Mr. MUIR (*Lisgar*): I wonder if you might send copies of that brochure to the western members.

Mr. McNAMARA: Yes, we will be glad to do that.

Mr. EARL:

United States Disposal Programmes

The Annual Report of the Board for the crop year 1958-59 outlines the United States surplus disposal policies (see Pages 16, 17 and 18). These programmes were continued and intensified during 1959-60 under increased appropriations by the United States Congress, with wheat and flour exports under government programmes increasing from 302 million bushels during the 1958-59 crop year to 373 million bushels during the 1959-60 crop year. Legislative changes affecting the surplus disposal programmes enacted during the 1959-60 crop year, together with the performance under the major programmes during the same period, are as follows:

(1) *Disposal of Grains for Local Currencies:*

Title I—Public Law 480 and Section 402 of Public Law 665

An amendment of September 21, 1959 to the Agricultural Trade Development and Assistance Act of 1954 extended the authority for

Title I of Public Law 480 for two years to December 31, 1961. A further \$1.5 billion was appropriated for use during each of the calendar years 1960 and 1961, bringing the total authorizations under this programme to \$9.25 billion. In this amendment was the provision that not less than the equivalent of 5 per cent of the foreign currency accruing from sales under Title I be available for agricultural market development activities. Other revisions in the use of foreign currency provided for the purchase of additional materials, broadening of development programmes, purchase of non-food items for emergency use and the use of a limited amount of funds for audio-visual material.

From the inception of the programme in July, 1954 to June 30, 1960, 195 agreements or supplements to agreements had been entered into with 38 countries at an estimated cost to the Commodity Credit Corporation of \$6.8 billion. During this period agreements involving wheat and/or flour have been made with 28 countries and exports of wheat and flour since the inception of this programme have amounted to 1,028 million bushels, of which 301 million bushels were exported during the 1959-60 crop year. The recipient countries were Austria, Brazil, Ceylon, Chile, China (Taiwan), Colombia, Ecuador, Finland, Greece, Iceland, India, Indonesia, Iran, Israel, Italy, Japan, Korea, Pakistan, Paraguay, Peru, Poland, Portugal, Spain, Turkey, U.A.R. (Egypt), U.A.R. (Syria), Uruguay and Yugoslavia.

Wheat and flour exports under Section 402 of Public Law 665 amounted to 13 million bushels during the 1959-60 crop year. Total wheat and flour exports under this programme from July, 1954 to June 30, 1960 amounted to 258 million bushels. The recipient countries for wheat and/or flour have been Austria, Bolivia, Ceylon, China (Taiwan), Denmark, Egypt, Ethiopia, Formosa, France, Germany, Greece, Guatemala, India, Indo-China, Iran, Israel, Japan, Jordan, Korea (South), The Netherlands, Pakistan, Turkey and Yugoslavia.

The ACTING CHAIRMAN: Are there any questions on this item?

Mr. ROGERS: Mr. Chairman, I notice that China is mentioned. How about that?

Mr. McNAMARA: It is Taiwan—Formosa.

Mr. ROGERS: Oh, it is not mainland China?

Mr. McNAMARA: No.

Mr. HORNER (*Acadia*): What amount would Japan be receiving under this program?

Mr. McNAMARA: In recent years Japan is not a recipient. This is simply reviewing the past experience, since the inception of the plan.

The ACTING CHAIRMAN: Are there any more questions.

Mr. EARL:

(2) *Disposal of Grains for Famine and Disaster Relief:*

Title II—Public Law 480

In the amendment of September 21, 1959 to the Agricultural Trade Development and Assistance Act of 1954 provision was made for extending the authority of Title II of Public Law 480 for two years to December 31, 1961. The amendment also provided \$300 million annually during the calendar years 1960 and 1961, bringing the total funds authorized under Title II to \$1.4 billion. The Act was further amended in May, 1960 when legislation provided for a broader use of C.C.C. stocks of surplus agricultural commodities to assist needy people and pro-

mote economic development in underdeveloped areas in addition to that which can be accomplished under Title I and Title IV. This amendment also authorizes the payment of transportation cost of commodities transferred under Title II to designated points in landlocked countries. Prior legislation provided for the payment of ocean freight costs on Title II shipments. Wheat and flour exports under Title II during the 1959-60 crop year totalled 11 million bushels, involving a cost of \$37.4 million. Total wheat and flour exports under this programme from inception to June 30, 1960 totalled 75.9 million bushels for an estimated value of \$258.6 million. The value of feed grains exported under this programme to June 30, 1960 amounted to \$54.8 million, of which \$8.4 million were applied in the crop year 1959-60. Donations of cereals have been made to the following 37 countries: Afghanistan, Austria, Bolivia, Ceylon, China, Costa Rica, Czechoslovakia, Ethiopia, Germany (East), Germany (West), Ghana, Guatemala, Guinea, Haiti, Honduras, Honduras (British), Hungary, India, Iran, Italy, Japan, Jordan, Korea, Lebanon, Libya, Mexico, Morocco, Nepal, Pakistan, Peru, Ryukyu Islands, Tunisia, Turkey, Uruguay, Vietnam, Yemen and Yugoslavia.

(3) *Disposal of Grains under Barter Arrangements:*

Title III—Public Law 480

Title III requires that barter transactions be in the best interest of the United States and that no restrictions be placed on countries of the free world into which surplus commodities may be bartered, except where necessary to take reasonable precautions to assure that world prices of agricultural commodities are not unduly disrupted or cash sales for dollars replaced. To safeguard usual marketings of the United States and avoid undue disruption of world prices of agricultural commodities or replacement of cash sales for dollars, the United States Department of Agriculture on September 16, 1959, announced a number of changes in the barter programme through which the Commodity Credit Corporation exchanges surplus agricultural commodities for strategic and other material produced abroad. These changes are outlined in detail on Pages 17 and 18 of the Board's 1958-59 Annual Report.

Since July 1, 1954, 253.5 million bushels of wheat and flour have been exported under this programme, of which 23.7 million bushels were exported during the 1959-60 crop year. During the 1959-60 crop year 43.3 million bushels of oats, barley, rye and corn were exported from the United States, bringing the total quantity of these four grains exported from the United States under this programme since July 1, 1954 to 293.1 million bushels. Since July 1, 1954 approximately 97 countries have received agricultural commodities under this programme totalling \$1.2 billion.

The ACTING CHAIRMAN: Are there any questions on this paragraph three?

Mr. MUIR (*Lisgar*): I wonder if the chairman would like to comment on the reason why the reduction provision is not working?

Mr. McNAMARA: It is related to their production program. They are not on a sound basis so far as production within the United States is concerned. I think they are moving a lot of grain, but they still have uneconomic production at home, and they are not helping it in any way by these special aid programs.

Mr. RIDDEL: I think under the production program they still encourage almost maximum production, except under these plans where grain has been taken out of production. But on the other hand they allow the use of fertilizer

which can make up for the production by heavier production, on the better land, and which offsets the production from the poorer lands that have been taken out of production.

Mr. MUIR (*Lisgar*): Has their volume actually increased under their retirement of some of these lands?

Mr. McNAMARA: Yes, their wheat crop last year was the second largest in history, and this year it will be almost as large again; so instead of reducing their production, it has actually increased.

The ACTING CHAIRMAN: Are there any more questions?

Mr. HORNER (*Acadia*): About the middle of paragraph (2) you say "the act was further amended in May, 1960 when legislation provided for a broader use of the C.C.C. stocks of surplus agricultural commodities . . ." and then in paragraph (3) you say, as I remember it—there was something along the line which suggested that "to safeguard usual marketings of the United States and avoid undue disruption of world prices of agricultural commodities or replacement of cash sales for dollars, the United States Department of Agriculture . . .", and so on. In other words, here you say they cannot curtail the use of barter in the Commodity Credit Corporation, and in the first place they make a broader use of it.

Mr. McNAMARA: In paragraph two we are dealing with the type of disposal of grain for famine and disaster relief, while in paragraph three, it is disposal of grain under barter. The experience of the United States is that the barter arrangement has not worked out satisfactorily, and also that these barter transactions were displacing dollar sales which they could have been making. They realized this and put a tighter control on their barter transactions.

Mr. HORNER (*Acadia*): They are watching the barterers, but in the case of famine relief, they are more liberal.

Mr. McNAMARA: That is right.

The ACTING CHAIRMAN: Are there any more questions?

On item 4 "long-term supply contracts: Title IV—public law 480".

Mr. EARL:

(4) Long-Term Supply Contracts:

Title IV—Public Law 480

The purpose of this Title, which was provided for in September 21, 1959 amendment to the Agricultural Trade Development and Assistance Act of 1954, is to utilize surplus agricultural commodities to assist the economic development of friendly nations by providing long-term credit for purchase of surplus agricultural commodities for domestic consumption during periods of economic development. Under this new provision the President of the United States is authorized to enter into agreement with friendly nations to undertake to provide for delivery annually of certain quantities of surplus commodities for a period not to exceed 10 years. Payments will be made in dollars in approximately equal instalments over a period not to exceed 20 years, with interest not exceeding the cost of funds to the United States Treasury.

Up to the end of the 1959-60 crop year the United States Government had not entered into agreements with the governments of other friendly nations for the delivery of surplus agricultural commodities under this Title. However, the Department of Agriculture is proceeding to implement this new authority by means of a "pilot" country approach from which to gain experience bearing on the later development of the Title IV programme.

¹ Preliminary.

Mr. HORNER (*Acadia*): This seems like a major step towards the granting of long term credit for the purchase of wheat. In effect this is what this is, is it not?

Mr. McNAMARA: Yes; to a degree. I thing I am right, if my memory serves me correctly. Mr. Esdale who is here can correct me if I am wrong. This pilot company which was developed this year turned out to be in Italy. This is an asinine move, because Italy is a country which has been importing substantial quantities from the United States this year and paying cash. They bought low quality wheat. They were reluctant to take our good milling wheat, because they were afraid their mills and the public generally would become too friendly to the quality of bread that could be produced. I am not arguing the merits of the Italians purchasing this American wheat. However, under this policy the Americans came out and made a substantial grant to Italy and disrupted the cash sales they were making. The only excuse they could give was that they had to try it out somewhere and Italy was the only country which would do it. Mr. Esdale informs me that Lebanon is the country. Italy was M.S.A.—mutual security.

Mr. HORNER (*Acadia*): What is M.S.A.? Is this security against the advance of communism?

Mr. McNAMARA: Yes.

Mr. HORNER (*Acadia*): In a sense.

Mr. McNAMARA: Yes.

Mr. HORNER (*Acadia*): Did this in any way curtail or lose any sales for Canada?

Mr. McNAMARA: No, because unfortunately we had not been successful in persuading the Italians to purchase Canadian wheat. This is why the sample was an asinine policy, because the Americans had the market and it was a waste of money.

The Acting CHAIRMAN: We will move on to item 8.

Mr. HORNER (*Acadia*): I have one more question. Would our Colombo plan gifts compare more with title II?

Mr. McNAMARA: Yes. Mr. Riddel points out it would compare more with title I because the Canadian government does get some benefit.

Mr. HORNER (*Acadia*): What about the Chinese deal?

Mr. McNAMARA: The Chinese deal is a straight commercial sale so far as Canada is concerned.

Mr. HORNER (*Acadia*): I know; but still we are accepting currency other than Canadian.

Mr. McNAMARA: But it is convertible currency, Title I currencies are not convertible. There is a big difference.

The Acting CHAIRMAN: We will go on to item 8. I thing Mr. McNamara said that the pool account in the supplementary report is more up to date.

Mr. McNAMARA: Yes.

The Acting CHAIRMAN: Shall we read No. 8 in the main report first and then go back?

Mr. McNAMARA: I would suggest that we clean up the main comments in respect of all the pools and then leave the final financial statements for cleaning up in the supplementary report.

The Acting CHAIRMAN: Then we will go on with item 8.

Mr. EARL:

8. 1959-60 Pool Account—Oats

POLICY

By authority of Order in Council P.C. 1959-788, June 22, 1959, Parts III and IV of the Canadian Wheat Board Act were extended to oats for the crop year 1959-60. By the same authority the initial price for oats was established at 60 cents per bushel basis No. 2 Canada Western Oats in store Fort William/Port Arthur. Initial prices for other grades were established by the Board and approved by Orders in Council.

BOARD RECEIPTS

The following table shows Board receipts from producers, by months, from August 1, 1959 to July 31, 1960:

	Bushels
August, 1959.....	859,070.3
September.....	3,462,298.5
October.....	1,996,450.9
November.....	1,629,815.7
December.....	1,218,128.9
January, 1960.....	822,358.1
February.....	814,798.7
March.....	731,131.5
April.....	947,594.7
May.....	2,076,811.3
June.....	2,364,796.8
July.....	6,737,869.9
TOTAL.....	23,661,125.3

Producer delivered 23.7 million bushels of oats to the 1959-60 Pool as compared with 38.7 million bushels in the previous Pool. During the crop year producers' deliveries of oats were confined to marketings under the unit and general quotas. There were no supplementary quotas applicable to oats.

GRADE PATTERN

The following table shows Board receipts of oats from producers by principal grades, along with the percentage of total receipts of each grade:

Grade (Including Toughs and Damps)	Bushels	% of Total
No. 2 Canada Western.....	141,105.2	.60
Extra No. 3 Canada Western.....	309,498.2	1.31
No. 3 Canada Western.....	2,000,938.1	8.46
Extra No. 1 Feed.....	4,863,326.2	20.55
No. 1 Feed.....	15,091,082.5	63.78
No. 2 Feed.....	1,000,330.7	4.23
No. 3 Feed.....	176,111.9	.74
Other grades.....	78,732.5	.33
TOTAL.....	23,661,125.3	100.00

The principal grades of oats delivered to the 1959-60 Pool were Extra No. 1 Feed and No. 1 Feed, these grades accounting for 84.3 per cent of total deliveries for the crop year.

1959-60 Pool Account—Oats

The following table shows the operating position of the 1959-60 Pool Account from August 1, 1959 to July 31, 1960:

	Bushels	
1. Oats acquired by the Board:		
(a) Producers' deliveries August 1, 1959 to July 21, 1960.....	23,661,125.3	
(b) Oats otherwise acquired.....	40,019.0	
(c) Purchased from the 1958-59 Pool Account—Oats.....	5,311,435.8	
Total oats acquired.....	29,012,580.1	
	(Value)	(Value)
2. Cost of oats acquired.....		\$16,854,471.84
3. Proceeds of sales and value of unsold stocks of oats as at July 31, 1960:

(a) Carrying charges including terminal storage.....	1,330,173.77	
(b) Interest and bank charges.....	53,624.86	
(c) Freight recovered on export oats..... (8,241.99)	
(d) Drying charges.....	30,333.52	
(e) Brokerage and Clearing Association charges.....	2,118.51	
(f) Administrative and general expenses...	86,981.21	1,494,989.88
6. Credit balance in the 1959-60 Pool Account—Oats, as at July 31, 1960, after valuing stocks of oats on hand at cost prices basis in store Fort William/Port Arthur.....		\$ 376,910.43

¹ Purchased from non-producers at the Board's initial prices basis in store Fort William/Port Arthur.

We will now skip to general comment on the marketing of oats.

General Comment on the Marketing of Oats—1959-60

Oats production in the prairie provinces in 1959-60 was estimated at 263 million bushels as compared with 240 million bushels in the previous year. Production in both years was moderate in volume. In the disposition of these oats crops, farm consumption was by far the most important factor. Under delivery quotas established in 1958-59 and 1959-60, producers marketed 38.7 and 23.7 million bushels in each crop year, respectively.

In contrast, oats production in the deficit areas within Canada continued at a higher than average level and this affected the volume of oats required from commercial stocks of western oats. During the latter part of July, 1960 there was a sharp increase in domestic demand for oats due to a reduced 1960 crop in Ontario. The United States market for oats and other export markets were very limited during 1959-60.

The commercial supply position for 1959-60 was as follows:

	Million bushels
Commercial carryover—July 31, 1959	39.0
Producers' deliveries—1959-60 Pool Account	23.7
TOTAL	62.7

Commercial supplies of western oats for 1959-60 amounted to 62.7 million bushels. On July 31, 1960 the carryover was 21 million bushels. This meant that the commercial utilization of oats during the crop year (for the domestic and export markets) amounted to 42 million bushels. Of these quantities of oats, 36 million bushels were sold in the domestic market and 6 million bushels were sold for export.

In supplying the 42 million bushels of oats required to meet commercial demand in 1959-60, the board utilized the equivalent of producers' marketings of 24 million bushels and the balance of the market was supplied from stocks carried over in elevators on July 31, 1959.

The reduction in stocks of oats carried in elevators was helpful in bringing supplies of commercial oats into a more realistic relationship with potential market demand.

During the crop year farm stocks of oats in the prairie provinces (as estimated by the dominion bureau of statistics) declined from 53 million bushels to 48 million bushels, and commercial stocks declined from 39 million bushels to 20.8 million bushels.

The following table shows exports of oats for the crop year 1959-60, along with comparative statistics for 1958-59:*

	1959-60	1958-59
	(million bushels)	
Germany	2.2	1.3
The Netherlands	1.2	0.4
United States	1.1	1.4
United Kingdom	0.6	3.4
Belgium	0.4	0.1
Others	0.1	0.4
TOTAL	5.6	7.0

*Source: Board of Grain Commissioners for Canada.

As shown by the preceding table exports of oats in 1959-60 were 5.6 million bushels as compared with 7 million bushels in the previous crop year. Germany, The Netherlands and the United States were the principal buyers of oats, with smaller quantities going to the United Kingdom and Belgium. A sharp decline occurred in exports of oats to the United Kingdom during the past crop year.

The following table shows the monthly average board quotations for No. 1 feed oats, along with high and low prices recorded in each

month from August 1, 1959 to July 31, 1960 (all prices basis in store Fort William/Port Arthur):

	High	Low	Average
	(cents per bushel)		
August, 1959.....	73½	70½	71½
September.....	73½	72½	73
October.....	81½	73½	77½
November.....	81½	76½	79½
December.....	77½	71½	75½
January, 1960.....	77½	76½	77½
February.....	76½	74½	75½
March.....	77½	73½	75½
April.....	77	75½	76½
May.....	78½	76½	77½
June.....	79½	76½	78½
July.....	81½	76	78½

The crop year commenced with asking prices for No. 1 feed oats ranging slightly over 70 cents per bushel. Market prices strengthened in September, October and November, reaching 81½ cents per bushel for No. 1 feed oats in mid-November, and an average of 79½ cents per bushel for the same month. In December, asking prices for No. 1 feed oats declined by nearly 4 cents per bushel. For the balance of the winter months prices were relatively stable, with little change in trend. From the opening of navigation prices strengthened moderately and reached the high point of the crop year in late July when there was a sharp increase in demand because of the crop damage in eastern Canada, particularly in Ontario.

In summary, the oats position continues to reflect lack of export demand and particularly demand from the United States. In the five years ending July 31, 1960, exports of oats averaged 12.4 million bushels as compared with an average of 52.9 million bushels during the preceding five-year period. Lack of exports continues to limit the quantities of oats which producers may expect to deliver.

The CHAIRMAN: Gentlemen, are there any question on the pool account of oats?

Mr. NASSERDEN: On page 19, under grade patterns, it shows there is very little No. 2 or No. 3 oats. Has this caused the board any concern or problems in marketing?

Mr. McNAMARA: Yes, it has caused us some concern in this particular crop year, and it has caused our marketing companies some concern as well. This was due to the weather and harvesting conditions, and it necessitated our making special arrangements for over-the-quota deliveries in carlots, with the result the millers had the opportunity of selecting good milling oats for shipment over and above the regular quota. To a great degree, this allowed the millers to get a better than normal quality of oats for their export business. But, certainly, the lack of adequate supplies does affect the industry.

Mr. NASSERDEN: You say it is mostly due to the weather?

Mr. McNAMARA: Yes. This particular year it was due to the harvesting conditions.

Mr. SOUTHAM: With the prospects of a short crop in the west this year, what is the situation in regard to Canada?

Mr. McNAMARA: This is difficult to answer now. As I indicated earlier, the elevator agency indicated to us that there was another 30 million bushels the producers would like to market prior to the end of July. However, the reports today from the west are still very discouraging. The president of the Saskatche-

wan pool has just come in, and he should be giving this situation. However, according to advice received from the Saskatchewan co-operative as published, the condition rate another 19 points this week, and our reports on deliveries, in the west particularly, in connection with oats and barley, is to the effect that they are slowing up rapidly. If the western producers now decide they are going to retain for home consumption the bulk of the oats that we were anticipating would be delivered, this will tighten up the supply materially. This is a situation the board will have to watch very closely the next few days. It may be that the present stocks of oats which we were planning on moving to the Lakehead, and then east, will be required locally, and we may have to consider opening up quotas in the Peace river district where crop conditions are more favourable in obtaining adequate supplies to meet the market requirements.

Mr. ROGERS: A 40 million bushel drop a year is considerable. You say here that exports of oats averaged 12.4 million bushels as compared with an average of 52.9 million bushels during the preceding five-year period. What is the reason for this?

Mr. McNAMARA: It has been due to the loss of the American market. The American market really is the only commercial outlet for any great volume of Canadian oats. However, during the last five years, on account of the price prevailing in the United States, there has not been a market for Canadian oats in the United States, and we have not been able to compete. And, the position this year is going to be even more unfavourable than it was last year because, as we reported last year, we exported 5.6 million bushels of oats. Up until June 14th of this year we have been able to export only 1.7 million bushels. There is practically no export movement of oats outside of Canada.

Mr. HORNER (*Acadia*): I do not know whether or not this is the place where we are going to deal with this feed mill question, or whether it may be that you will wish to deal with it later.

Mr. McNAMARA: We dealt with it in our supplementary report. We can deal with it now or later, whichever you wish.

Mr. HORNER (*Acadia*): If you deal with it in a supplementary report, that will be fine.

Mr. McNAMARA: I think this is where we give you the final results.

Mr. NASSERDEN: On page 20, under "Comment on the operating statement—1959-60 pool account—oats", it says that a small amount of oats was purchased from other than producers. What does that cover?

Mr. McNAMARA: Just a minute, we shall get you that information.

Mr. RIDDEL: I am sorry, but we have not got the details. The purchases were made from other than producers at the initial payment prices. I presume they may have been overages but I cannot figure out why an elevator company would sell those overages to the board, when they have the right to do otherwise. There is a footnote in the supplementary report, indicating that the 40,019 bushels represented purchases from non-producers at the board's initial prices, basis in store Fort William-Port Arthur.

Mr. McNAMARA: We shall get the breakdown of this for you, Mr. Nasserden.

The VICE CHAIRMAN: We shall go on to the next item.

Mr. EARL:

9. 1959-60 Pool Account—Barley

POLICY

By authority of order in council P.C. 1959-788, June 22, 1959, parts III and IV of the Canadian Wheat Board Act were extended to barley

for the crop year 1959-60. By the same authority the initial price for barley was established at 96 cents per bushel basis No. 3 Canada western six-row barley in store Fort William/Port Arthur. Initial prices for all other grades of barley were established by the board and approved by orders in council.

BOARD RECEIPTS

The following table shows receipts of barley from producers, by months, from August 1, 1959 to July 31, 1960:

	Bushels
August, 1959.....	1,091,140.9
September.....	6,403,074.9
October.....	9,862,794.3
November.....	9,485,487.9
December.....	8,952,846.0
January, 1960.....	5,541,835.5
February.....	4,722,868.0
March.....	3,619,114.1
April.....	4,535,527.5
May.....	8,096,444.8
June.....	9,803,358.6
July.....	22,788,695.5
TOTAL.....	94,903,188.0

Producers' deliveries of barley amounted to 94.9 million bushels in 1959-60 as compared with 122.4 million bushels in the previous crop year. Producers delivered barley steadily for the period from September through June, while deliveries increased sharply in the final month of the crop year. July deliveries of 22.8 million bushels constituted nearly one-quarter of total barley deliveries for the crop year.

GRADE PATTERN

The following table shows the principal grades of barley delivered by producers in 1959-60:

Grade (Including Toughs and Damps)	Bushels	% of Total
No. 2 C.W. Six-Row.....	3,609,318.8	3.80
No. 3 C.W. Six-Row.....	26,439,953.1	27.86
No. 4 C.W. Six-Row.....	2,104,596.9	2.22
No. 2 C.W. Two-Row.....	1,556,133.3	1.64
No. 3 C.W. Two-Row.....	6,574,458.1	6.93
No. 1 Feed.....	44,920,204.6	47.33
No. 2 Feed.....	8,213,523.0	8.65
No. 3 Feed.....	1,201,423.0	1.27
Other grades.....	283,572.2	.30
TOTAL.....	94,903,188.0	100.00

The principal grades of barley delivered to the 1959-60 pool were No. 1 feed and No. 3 C.W. six-row; these grades accounted for about 75 per cent of total receipts. Other grades were delivered by producers in nominal quantities. As a result of the unfavourable harvest in 1959, 8.0 million bushels of barley were delivered as toughs and 2.7 million bushels as damps.

STANDING COMMITTEE

1959-60 Pool Account—Barley

The following table shows the operating position of the 1959-60 pool account from August 1, 1959 to July 31, 1960:

	Bushels	
1. Barley acquired by the board:		
(a) Producers' deliveries August 1, 1959 to July 31, 1960.....	94,903,188.0	
(b) Barley otherwise acquired.....	1,442.6

Total barley acquired.....	109,175,968.4	
	Value	(Value)
2. Cost of barley acquired.....		\$ 97,463,182.40
3. Proceeds of sales and value of unsold stocks of barley as at July 31, 1960:		
(a) (i) Completed sales at realized prizes..	\$58,315,754.83	
(ii) Uncompleted sales at contract prices	3,275,547.39	
Total proceeds from sales.....	61,591,302.22	
(b) Value of unsold stocks of barley at cost.	41,095,242.85	102,686,545.07
4. Gross surplus as at July 31, 1960.....		5,223,362.67
5. Operating costs—August 1, 1959 to July 31, 1960:		
(a) Carrying charges including terminal storage.....	3,438,854.72	
(b) Interest and bank charges.....	135,334.82	
(c) Freight recovered on export barley.....	(362,799.45)	
(d) Diversion charges on export barley.....	65,469.57	
(e) Drying charges.....	221,737.41	
(f) Brokerage and Clearing association charges.....	3,415.41	
(g) Administrative and general expenses...	333,043.31	3,835,055.79
6. Credit balance in the 1959-60 pool account—barley, as at July 31, 1960, after valuing stocks of barley on hand at cost prices basis in store Fort William/Port Arthur.....		\$ 1,388,306.88

¹ Purchased from non-producers at the board's initial prices basis in store Fort William/Port Arthur.

COMMENT ON THE OPERATING STATEMENT— 1959-60 POOL ACCOUNT—BARLEY

The above table sets forth the following position of the 1959-60 barley pool for the period from August 1, 1959 to July 31, 1960. The statement should be interpreted on the basis of the following considerations:

- (1) The 1959-60 barley pool consisted of 109.2 million bushels. Producers' deliveries to the pool were 94.9 million bushels. A total of 14.3 million bushels were transferred from the 1958-59 pool as at March 4, 1960. A small amount of barley was purchased from others than producers.
- (2) The 1958-59 pool was closed as at March 4 1960 and therefore a substantial part of board sales of feeding grades of barley during the crop year 1959-60 were credited to the 1958-59 pool account. It has been the practice of the board to credit sales of barley accepted for malting or other industrial uses to the crop account to which such barley was delivered by producers. Therefore, grades of barley delivered by producers in 1959-60 and accepted for malt-

ing or other specialized uses were credited to the 1959-60 pool account, even though these grades were sold prior to the closing of the 1958-59 pool account.

- (3) From August 1, 1959 to July 31, 1960 completed sales of barely for the account of the 1959-60 pool were 58.5 million bushels. In addition, the board had uncompleted sales of barley on its books as at July 31, 1960 in the amount of 3.3 million bushels. Weight losses in drying were 189,879.3 bushels.
- (4) The unsold inventory in the 1959-60 pool as at July 31, 1960 was 47.1 million bushels. This inventory was valued at cost; i.e. at initial payment prices for each grade in the inventory.
- (5) Operating costs of the 1958-59 pool account to July 31, 1960 amounted to \$3,835,055.79. These costs consisted principally of carrying charges on barley stored in country and terminal elevators and amounted to \$3,438,854.72. Interest and bank charges were \$135,334.82. Freight recoveries on barley shipments to pacific coast ports for export provided a credit item of \$362,799.45. Diversion charges on barley shipped to pacific coast ports for export were \$65,469.57. Drying charges were \$221,737.41. Brokerage and clearing association charges were \$3,415.41, while administrative and general expenses to July 31, 1960 amounted to \$333,043.31.
- (6) After applying proceeds of sales, valuing the inventory at cost and allowing for operating costs as recorded above, the 1959-60 barley account showed a credit balance of \$1,388,306.88.

Mr. BOULANGER: What is the total production of barley?

Mr. McNAMARA: In western Canada?

Mr. BOULANGER: Yes.

Mr. McNAMARA: You mean produced in western Canada?

Mr. BOULANGER: Yes.

Mr. McNAMARA: That is given in table three, on page 3, in the appendix. Total production of barley was 201,000,000 bushels in 1960.

Mr. BOULANGER (*Interpretation*): This means that only 94 million bushels were delivered to the wheat board?

Mr. McNAMARA: That is right. The rest was retained on the farms and used in western Canada.

Mr. BOULANGER (*Interpretation*): Was the balance sold on the free market?

Mr. McNAMARA: The bulk of the balance would be fed by the producers on their own farms, or else marketed in the provinces in which it was produced. It was not put into commercial channels.

Mr. MUIR (*Lisgar*): In spite of the toughs and the damp, you had enough for malting purposes in that particular crop year?

Mr. McNAMARA: Yes. The Manitoba barley came up in fairly good condition and we were able to supply the malting demand.

Mr. MUIR (*Lisgar*): What is the domestic malting demand?

Mr. McNAMARA: About 18 to 20 million bushels. That is what the Canadian maltsters use. We shall leave the pool account—barley, and deal with general comment.

Mr. EARL:

GENERAL COMMENT ON THE MARKETING OF BARLEY—1959-60

The commercial utilization of barley in 1959-60 amounted to 108 million bushels as compared with 112 million bushels in the previous

crop year. Domestic utilization amounted to 44.5 million bushels, while exports of whole barley were 57.7 million bushels and exports of barley products amounted to a further 6.1 million bushels. During the crop year there was a moderate increase in the domestic use of barley but this increase was not sufficient to offset a decline of 6.7 million bushels in exports.

There was a steady movement of barley into export channels throughout the crop year, and again overseas clearances were heavily concentrated at Pacific coast ports. Pacific coast shipments amounted to 31.9 million bushels as compared with 5 million bushels from St. Lawrence and Atlantic seaboard ports, and 7.2 million bushels cleared for overseas destinations from the Lakehead.

The following table shows exports of barley in 1959-60, along with comparative statistics for the previous crop year:

	1959-60	1958-59
	(million bushels)	
United Kingdom.....	30.1	41.5
United States.....	13.5	10.2
Poland.....	5.3	4.3
Germany.....	4.2	.3
The Netherlands.....	1.3	.8
Switzerland.....	.8	.6
Syria.....	.7	—
Kuwait.....	.5	—
Denmark.....	.4	—
Belgium.....	.4	.5
Italy.....	.3	.1
Peru.....	.2	—
Japan.....	—	5.7
Others.....	—	.4
	57.7	64.4
Barley products.....	6.1	6.1
TOTAL.....	63.8	70.5

As shown in the preceding table exports of whole barley amounted to 57.7 million bushels as compared with 64.4 million bushels in the previous crop year. The United Kingdom continued to provide the largest market for barley in spite of a decrease in exports to the United Kingdom in 1959-60. Exports to the United States, Poland, Germany, The Netherlands and Switzerland increased as compared with the previous crop year. The middle east provided new, small markets in 1959-60, and small shipments were also made to Italy and Peru. For the first time in ten years Japan did not import Canadian barley.

Exports of barley products amounted to 6.1 million bushels in both 1959-60 and 1958-59.

The following table shows the monthly average board asking prices for No. 1 feed barley, along with high and low prices recorded each month from August 1, 1959 to July 31, 1960 (all prices basis in store Fort William/Port Arthur):

	High	Low	Average
	(cents per bushel)		
August, 1959.....	94 $\frac{3}{4}$	91	93 $\frac{3}{4}$
September.....	94 $\frac{3}{4}$	93 $\frac{1}{4}$	94
October.....	96 $\frac{3}{4}$	93 $\frac{3}{4}$	95 $\frac{1}{2}$
November.....	97 $\frac{1}{2}$	93 $\frac{1}{2}$	95 $\frac{1}{2}$
December.....	96 $\frac{1}{2}$	92 $\frac{1}{2}$	95 $\frac{1}{2}$
January, 1960.....	97 $\frac{1}{4}$	95 $\frac{3}{4}$	96 $\frac{1}{4}$
February.....	97 $\frac{1}{4}$	94	95 $\frac{1}{2}$
March.....	96 $\frac{1}{2}$	93	95 $\frac{1}{2}$
April.....	97	95 $\frac{3}{4}$	96 $\frac{1}{2}$
May.....	100 $\frac{1}{2}$	96 $\frac{3}{4}$	98 $\frac{1}{2}$
June.....	99 $\frac{3}{4}$	95 $\frac{3}{4}$	98 $\frac{1}{2}$
July.....	97 $\frac{1}{4}$	96	96 $\frac{1}{4}$

Board asking prices for No. 1 feed barley fluctuated with narrow limits in 1959-60. The range was from 91 cents per bushel to \$1.00½ per bushel. Prices strengthened moderately during the first half of the crop year, declined slightly in February and March, strengthened during the April-June period and declined in the final month of the crop year. The average of board asking prices for No. 1 feed barley for the crop year 1959-60 was 96 cents per bushel as compared with 96¼ cents per bushel for the previous crop year.

The utilization of barley in the domestic market and for export exceeded the quantity of barley delivered by producers under delivery quotas established during the crop year. As a result there was a reduction in year-end commercial stocks from 71.2 million bushels on July 31, 1959 to 58.5 million bushels on July 31, 1960. There was a small increase in the farm carryover of barley on July 31, 1960 as compared with the previous year.

The international barley market was extremely competitive in 1959-60. Competition not only came from other exporting countries such as the United States, Australia and Argentina, but from alternative feedstuffs such as corn and sorghums. There was evidence in the latter part of the crop year that a period of more intense competition in the international market had commenced.

MR. KORCHINSKI: Could you give us an indication why Japan suddenly stopped its purchase of barley?

MR. McNAMARA: The previous purchase of Canadian barley by the Japanese was for human consumption as processed barley. It was a substitute for rice. But the production of rice in Japan has increased since then. There are now ample supplies of rice available, and Japan has discontinued the use of processed barley as a substitute for rice.

MR. KORCHINSKI: In other words, there will no longer be a market for barley in Japan?

MR. McNAMARA: I would not say that. I would say that it is not likely there would be a market for processed barley in Japan. But I think that as the Japanese economy grows, as they start producing more livestock, they will again develop a feeding market for barley in Japan. We are hoping this will be the case.

MR. KORCHINSKI: What is the over-all picture with regard to the prospects of selling barley, since it appears there is going to be competition from other grains such as corn?

MR. McNAMARA: I would say the outlook for export of Canadian barley—I include oats in my statement—is far from favourable. There is no doubt in my mind—take Europe, for example—that in the common market the announced policies of these various governments to increase production at home is going to affect materially the importation of feeding grains. In the case of wheat, we have a quality that cannot be matched by any other producing country in the world. But this is not true in the case of our barley. Many barleys produced in Europe are barleys superior in quality to Canadian barley. I am afraid that unless this market that has recently developed in China can be expanded, we are going to be confronted with a difficult problem in so far as export Canadian barley for feeding purposes overseas is concerned.

MR. KORCHINSKI: Why is European barley superior to ours?

MR. McNAMARA: I think that possibly in Canada our plant breeders have been paying too much attention to produce a malting type of barley, to take advantage of the limited market for such barley at attractive prices in the

United States. I would also suggest that some of the farming methods that some of you people adopt when you are using barley as a clean-up crop and producing almost as much wild oats in the barley as you do barley—which is not the case in Europe—is also a factor. You are making our barley unpopular.

Mr. MUIR (*Lisgar*): You must be talking about Saskatchewan and Alberta.

Mr. HORNER (*Acadia*): Not Alberta.

My question is about shipments through the St. Lawrence to the Atlantic ports. I see that 7.3 million bushels were cleared for overseas destination from the lakehead. This compares with about 12 million bushels of wheat. Why would there be a greater percentage of barley moving directly from the lakehead? Is it because it is a lighter and bulkier load?

Mr. McNAMARA: There has been a demand, particularly in the United Kingdom, for barley for distilling purposes. They like our six-row barley for this purpose. But unfortunately, six-row barley, as you know, peels quite readily, and if it is handled through various terminal facilities it tends to lose grade. Traders have experienced a lot of difficulty in having that barley transferred first by canaller to Montreal and then reshipping it. In an effort to preserve the quality of the barley, they have been concentrating on trying to move it with the least possible amount of handling. This accounted to quite a large degree for the larger than normal movement of barley out of Fort William.

Mr. HORNER (*Acadia*): Did this cut down on the peeling and cracking of the barley, moving it just once?

Mr. McNAMARA: Yes. Every time you handle barley the percentage of peeling increases. We found considerable difficulty in having barley shipped from Fort William. It was graded No. 3 C.W. By the time it got to Montreal it lost grade considerably.

Mr. SOUTHAM: My question was put by Mr. Korchinski. It related to the problem of Japan dropping out of the market. It has been answered very adequately by Mr. McNamara.

Mr. NASSERDEN: On this question of barley grades going out of the country, has Churchill been used to any extent, and is there any possibility of developing movement of barley through Churchill?

Mr. McNAMARA: No. Barley has never been shipped out of Churchill, and there does not seem to have been any interest in shipping barley out of Churchill. The European demand for Canadian barley quite largely revolves around importation in the United Kingdom for distilling purposes. They have taken quite a lot of barley from the west coast, where it could be shipped with a minimum of handling. To my knowledge there has been no inquiry for barley out of Churchill.

Mr. RIDDEL: In connection with barley, the market in the United Kingdom usually develops in the spring after they have cleaned up their stock of home grown barley. They have an agreement whereby they will use as much of the home grown barley as possible, and it is only after that period that they go into the market and buy Canadian barley, if they do buy at all. Therefore, the shipping period from Churchill does not fit in with the shipping period when they require to import stocks from Canada.

Mr. EARL:

10. *Payment Division*

The following table shows the major payments completed during the crop year 1959-60:

	Date First Cheques Mailed	Date Completed	Number of Cheques Issued	Total Value of Cheques Issued
1958-59 Pool Account—Wheat:				
Interim Payment.....	Feb. 22, 1960	Mar. 11, 1960	274,283	\$36,699,415.19
Final Payment.....	June 17, 1960	July 11, 1960	274,274	33,919,322.24
1958-59 Pool Account—Oats:				
Final Payment.....	Apr. 4, 1960	Apr. 13, 1960	63,467	3,153,318.57
1958-59 Pool Account—Barley:				
Final Payment.....	Apr. 14, 1960	Apr. 22, 1960	141,025	5,335,502.66
TOTAL.....			753,049	\$79,107,558.66

The Payment Department also issued 46 cheques (value \$4,195.86) applicable to the 1940, 1941, 1942, 1943 and 1944 Wheat Accounts; and 78 cheques (value \$14,920.72) covering Adjustment Payments and Final Payment applicable to the 1945-49 Pool Account—Wheat.

The Acting CHAIRMAN: Are there any questions? If there are not, we can turn to the next item.

Mr. EARL:

11. *Legal Department*

The Legal Department dealt with all matters of a legal nature affecting the operations of the Board.

The Department continued to assist the Payment Department in connection with payments to estates of deceased persons.

During the crop year 132 persons were prosecuted in connection with breaches of the Canadian Wheat Board Act and Regulations thereunder, as compared to 93 persons prosecuted during the 1958-59 crop year.

The Department also assisted the Advance Payments Department in the enforcement of the Prairie Grain Advance Payments Act and the collection of default accounts. For the first time prosecutions were conducted under the Prairie Grain Advance Payments Act, and five persons were prosecuted for breaches thereof.

Similarly, for the first time proceedings were taken in the Exchequer Court of Canada to recover monies outstanding under advances obtained pursuant to the Prairie Grain Advance Payments Act. In this connection 274 actions were commenced in the Exchequer Court of Canada. Of these actions, by the end of the crop year judgment had been obtained with respect to 74, and in 103 cases payment in full of the account had been received before judgment was obtained. Proceedings were still pending at the end of the crop year in relation to the balance of the Court actions which were commenced.

Mr. HORNER (*Acadia*): You say that during the crop year 132 persons were prosecuted. Can you give the committee some idea of the general trend, as to why these prosecutions were made. I do not want complete details, but it seems like a lot. What was the main cause?

Mr. MONK: Most of these prosecutions were for delivering in excess of the quota, delivering from land other than that named in the permit, and like infractions. The number of prosecutions tended to level out and

reduce in the last few years, particularly as producers are becoming more accustomed to this system and understand it. Some years ago we used to have more prosecutions than we have now.

Mr. NASSERDEN: What was the meaning of the five prosecutions under the Prairie Grain Advance Payments Act?

Mr. MONK: In regard to these five persons, I do not remember the details, but generally they made false declarations in order to get an advance, that is to say they said they had more grain than they had, or they said they had grain when they had not.

Mr. MILLIGAN: Were any of these prosecutions for deliveries to feed mills?

Mr. MONK: Yes, at least two were. We had two test cases with feed mills. I do not remember whether they were prosecutions of producers, or prosecutions of producers, or prosecutions of agents of feed mills.

Mr. HORNER (*Acadia*): In all cases, who receives the fine if there is a fine levied?

Mr. MONK: The fine goes through the normal channels, through the Department of Justice.

Mr. HORNER (*Acadia*): In other words, like a magistrate's fine?

Mr. MONK: That is so.

Mr. HORNER (*Acadia*): Why is it that this is so with the wheat board? In the case of the board of grain commissioners, they said in their report that in one prosecution there was a fine of \$100, and the Receiver General got it and they picked up the \$100.

Mr. MONK: This ordinarily goes to the Receiver General of Canada. It goes to the general fund of the Dominion. It does not go to the board.

Mr. HORNER (*Acadia*): It does not go to the board? I thought you said it went to the magistrate?

Mr. MONK: The court collects it and it is remitted under the provisions of the code to the Receiver General through the Department of Justice.

Mr. ROGERS: What is considered an infraction in regard to these deliveries over the quota? How many bushels are allowed?

Mr. MONK: We have a general policy that we do not prosecute for a trifling amount.

Mr. ROGERS: What is a trifling amount?

Mr. MONK: I do not remember any prosecutions offhand for less than 50 or 75 bushels. Most of them run considerably more than that. It is a matter of enforcement policy, actually. If you are in an area where you have a number of infractions, you may have to prosecute them all, even though some of them are small, since you do not want to be in a position where you can be accused of picking and choosing.

Mr. KORCHINSKI: I was wondering how you located these infractions, whether it is in the course of routine checks or whether they are brought to your attention by someone?

Mr. MONK: Most of them come to our attention through routine checks by our inspectors. There are occasions where we get information from other sources.

Mr. KORCHINSKI: How often do you make these routine checks? Are they spot checks or do you move everywhere?

Mr. MONK: We have a group of inspectors whose duty it is to examine the books of all elevators and they have regular routine calls which they make on each elevator in their district.

Mr. McNAMARA: I would like to make a point in connection with Mr. Monk's interpretation of "reasonable". I would not want the impression to be left in the country that we look with complacency on breaches of the quota regulations under 75 bushels. Actually, one bushel is a breach of the regulation, and while it is true that we try to be reasonable and sometimes pass up a small infraction, I would not want it to be made public that every producer can have 75 bushels over the regular amount.

Mr. KORCHINSKI: How would you spot, in the course of a routine check, whether a farmer had completed an incorrect form in obtaining his cash advance or not, if you just make a spot check on the elevator without seeing this form?

Mr. MONK: I was referring to quota infractions then. As far as advance payments are concerned, these come to our attention in various ways. The particular ones which I think were prosecuted here came to our attention because no payments were received in repayment of the advance, and we sent people out to check and they found that they never did have any grain.

Mr. KORCHINSKI: In no cases under the Prairie Grain Advance Payments Act do you make a check on the elevator man and then go over to see the farmer's grain?

Mr. MONK: Not as a routine matter. If we have anything which arouses our suspicion, we follow it down to find out what the story is.

Mr. FORBES: How many inspectors have you got on the roads for these routine checks, and so on?

Mr. McNAMARA: I make it 16, approximately.

Mr. FORBES: I think I could dodge one or two, but I could not dodge 16. That is for the three prairie provinces?

Mr. McNAMARA: Yes.

Mr. NASSERDEN: These 16 men perform other duties and are not just checking?

Mr. McNAMARA: That is so.

Mr. MUIR (*Lisgar*): I wonder if you have had any trouble with your treated grain, that is, grain which has been treated for seed?

Mr. McNAMARA: This has been under the notice of the board of grain commissioners. There have been some cases where the grain has been treated with cerasan. It is dealt with by the inspection department, and then it is condemned. We do not accept it. This is policed by the board of grain commissioners.

Mr. ROGERS: To go back to a question I started with first, you say the inspector or supervisor inspects the elevators. He finds these infractions, the producer having delivered over the quota. Does the producer get an opportunity to rectify the situation, or is it taken up?

Mr. MONK: No, the breach has usually occurred some time before we discover it, because it would be unlikely that it would occur within a day or two before our inspector got there. It happens often enough and usually the procedure is followed that we have a police report and it is followed in investigation, statements are taken and a decision is reached as to whether there will be a prosecution or not.

Mr. ROGERS: What about the elevator agent? Does he tell the producer he has delivered grain over his quota?

Mr. MONK: Usually both the producer and elevator agent are prosecuted—when there is an agent.

Mr. HORNER (*Acadia*): Mr. Rogers has covered my question. I was going to ask whether all these prosecutions were against farmers, or people other than farmers?

Mr. MONK: I would think that about 50 per cent are against producers and 50 per cent against elevator agents.

Mr. HORNER (*Acadia*): That brings it down to roughly 66 farmers out of 230,000. That suggests that farmers are relatively honest.

Mr. McNAMARA: I think this point is very well taken. In view of the facts that there are 235,000 farmers, I must say it is a proud record, and the adherence to the quota and permit regulations is basically sound. This is true also in regard to the cash advances. I think that in the record of collections, no financial organization in Canada has ever had repayments such as we have experienced in this advanced cash legislation. It is a real credit to the integrity of the western producers. There are always one or two bad apples, but the position is generally sound. Of the 17 inspectors, we have five operating in Manitoba, six in Saskatchewan and six in Alberta.

Mr. FORBES: Do these fellows wear uniforms, or how can you identify one of them?

Mr. McNAMARA: We give them a new disguise every week.

The ACTING CHAIRMAN: We can turn to the next item.

Mr. EARL:

12. Staff and Officers

The following table shows the number of employees of the Board as at July 31, 1960 and July 31, 1959:

	July 31 1960	July 31 1959
Winnipeg	651	681
Calgary	30	30
Vancouver	17	17
Montreal	4	4
London, England	4	3
Rotterdam, Netherlands	2	2
Total	708	737

On July 31, 1960 the Board had 708 employees as compared with 737 on July 31, 1959.

Effective September 1, 1960, J. W. Snell, Assistant to the European Manager in London, was appointed as Assistant to the European Representative in Rotterdam. D. D. Yates, Assistant Sales Manager (Wheat), was appointed Assistant to the European Manager in London. C. A. Gusberti, Assistant Sales Manager (Coarse Grains), was appointed Assistant Manager (Sales), Vancouver Office. Pursuant to the decision of the Board to open an office in Tokyo, Japan, A. W. Cordon, formerly Executive Assistant (Sales), was appointed Far Eastern Representative of the Board, with headquarters in Tokyo. C. E. G. Earl, Comptroller of the Board, was appointed Comptroller-Secretary. D. H. Treleaven, Secretary of the Board, was appointed Executive Assistant. The latter three appointments were effective October 1, 1960.

13. Advisory Committee

Two meetings of the Advisory Committee were held during 1959-60.

The members of the Advisory Committee are: Mr. J. H. Wesson, Regina, Saskatchewan; Mr. J. E. Brownlee, Q.C., Winnipeg, Manitoba; Dr. W. J. Parker, Winnipeg, Manitoba; Mr. A. P. Gleave, Biggar, Saskatchewan; Mr. G. L. Harrold, Lamont, Alberta, and Mr. A. W. Platt, Edmonton, Alberta.

Mr. MUIR (*Lisgar*): I would like to ask Mr. Monk a question. His class-mate would like to know how large the legal staff is? I think he wants a job.

Mr. MONK: The legal staff in Winnipeg consists of myself and Mr. Robert Law. The prosecutions to which he is referring are handled by agents appointed by the Department of Justice in the country.

Mr. MUIR (*Lisgar*): I wonder if he considers ex M.P.'s as good legal material.

Mr. MONK: I am afraid I have nothing to say about the appointments of agents.

Mr. HORNER (*Acadia*): I notice you have quite a few foreign offices. Has this been enlarged recently?

Mr. McNAMARA: Yes, we supplemented the staff at the Rotterdam office by bringing in another representative, Mr. Snell, who was transferred from London. This was to enable him to cover, also, Belgium and Holland. They are doing more extensive travelling in Belgium and Switzerland. Mr. Yates has been taken from London to assist Mr. Lawrie, the European manager. In addition to this we have made some changes in the Vancouver setup. We are trying to bring some younger men along and give them experience outside of Winnipeg. As reported here, we have opened an office in Tokyo during the crop year, and that office is beginning to function. We have taken over most of the liaison work with the food agency in Japan.

Mr. MANDZIUK: What are the duties or functions of the advisory committee? You say it met twice in the year.

Mr. McNAMARA: These people, as you notice, are all connected with farm organizations in western Canada. They are close to the production field and on occasion we follow them up. They are set out under our act, and we get the benefit of their advice.

Mr. MANDZIUK: What do they advise you on?

Mr. McNAMARA: Oh, on a range of subjects. I would say that their advice is most beneficial on problems relating to operations in the country, such as production problems. I think we ourselves have had more experience in the sales field than they have, but they have much more knowledge of production problems in western Canada, and problems relating to quotas, and on things like that they are of considerable value to us.

Mr. BOULANGER (*Translation*): For how long are these officers appointed?

Mr. McNAMARA: You mean the advisory committee?

Mr. BOULANGER (*Translation*): Yes.

Mr. McNAMARA: At the pleasure of the crown.

Mr. BOULANGER (*Translation*): For how many years?

Mr. McNAMARA: There is no period set.

Mr. BOULANGER (*Translation*): Do you feel you should have an eastern representative on that committee?

Mr. McNAMARA: I think it would be very advisable if we had an eastern consumer representative and we have made such a recommendation

to our minister. I understand that it is under active consideration at the present time.

The ACTING CHAIRMAN: Shall we not take the rest that comes under part II as read?

Mr. HORNER (*Acadia*): I have one question with regard to this wheat problem. There has been a lot of talk recently around Ottawa that the price of bread is going to go up because of the recent price increase in wheat, and because of the devaluation of the dollar.

Mr. McNAMARA: Yes.

Mr. HORNER (*Acadia*): Would you seriously suggest that there is any real reason to increase the price of bread?

Mr. McNAMARA: No, but I am glad you asked this question because I think the facts of the situation should be made public. Certainly an increase in the price of bread that is being suggested by the bakeries—I do not think it could be related to the recent increase in the cost of the price of wheat. But we happen to have some figures prepared in that regard, and I would like it if Mr. Riddel could deal with this particular matter.

Mr. RIDDEL: Mr. Chairman, I have some figures and a statement I would like to give to the committee.

The quantity of wheat required to produce 100 lbs. of bakers' grade flour is subject to some variation from mill to mill and from one period to another. On the average it is probably a little less than 2.3 bus. but in order to be sure that we do not minimize the effect of an increase in wheat price, let us take that figure. On that basis an increase in wheat cost of 5 cents per bushel means an increase in the cost of bakers' grade flour of 5×2.3 or 11.5 cents per cwt.

This assumes that the full effect of the increased wheat cost is borne by the flour. To produce 100 lbs. of flour, a mill will simultaneously produce about $2.3 \times 60 = 138$ lbs. of by-products. If the selling price of the by-products rises as a result of the rise in the cost of wheat, then it would be unnecessary to raise the price of flour by quite as much as 11.5 cents per cwt.

We can say, therefore, that the increase in the cost of flour justified by an increase of 5 cents per bushel in the cost of wheat, could not exceed 11.5 cents per cwt.

The yield of bread from 100 lbs. of flour also varies from shop to shop. It is generally higher in large shops than in small ones, mainly because, with their equipment, the larger shops are able to incorporate more water in their doughs. But there are other factors, such as a greater efficiency in controlling losses, which also play a part.

It may be taken as certain that the large shops, in which most Canadian bread is baked, obtain not less than 150 lbs. of bread from 100 lbs. of flour. It is probably rather more than that. In small shops it might drop as low as 145 lbs. Even if we take a yield of 145 lbs., an increase in the cost of flour of 11.5 cents per cwt. would work out to an increase in the cost of bread of only 0.08 cents per lb. loaf. A rise in the cost of wheat of 5 cents per bushel could not, therefore, be held responsible for an increase of more than 0.08 cents per lb. of bread, or about $1/12$ th of a cent per loaf.

Mr. MANDZIUK: I think the committee would be interested to hear from the board as to their experience to date with controls, or with respect to the sales to feed mills. As you know, there is still considerable interest in this, and how it affects the wheat board set-up. What does your experience so far show?

Mr. McNAMARA: Mr. Chairman, this matter is dealt within our supplementary report, and I would like to suggest that we do not postpone this

discussion any longer, although the supplementary report does start off dealing with wheat. However, I suggest that we deal with oats and barley in the supplementary report, which will bring up this question of feed mills, and later the situation of feed mills in western Canada; it will bring this question before the committee, and then we can go back and discuss wheat.

The ACTING CHAIRMAN: Shall part II be accepted as read?

Agreed.

PART II

FINANCIAL STATEMENTS

The financial statements of The Canadian Wheat Board for the crop year ended July 31, 1960 are presented in this section of the Report. They consist of a Consolidated Balance Sheet (Exhibit I) which sets forth the financial position of the Board as at the foregoing date, together with other statements showing the results of Board operations to the close of the crop year, all as tabulated in the index preceding the financial statements and as discussed in Part I of this Report.

Due to the large volume of grain remaining unsold in the 1959-60 Pool Accounts for wheat, oats and barley, it was decided that it would be advisable to defer the closing of these accounts and hence none of these accounts have been finalized as at the date of this Report.

CONSOLIDATED BALANCE SHEET

The consolidated financial position of The Canadian Wheat Board as at July 31, 1960 is set forth in Exhibit I. With respect to some of the items appearing in the Consolidated Balance Sheet the following comments are submitted.

Stocks of Grain—\$695,105.13

WHEAT STOCKS—\$641,465,397.95

As at July 31, 1960 the total stocks of wheat held by the Board amounted to 462,585,424.9 bushels. Of this amount 61,709,070.2 bushels had been sold at established prices, but were undelivered at the year-end date. These stocks have been valued at contract prices and provision has been made for carrying charges to date of delivery. The remaining inventory of wheat amounting to 400,876,354.7 bushels consists of the following:

Balance of stocks transferred from the 1958-59 Pool Account.....		61,885,358.5
Balance of purchases from producers on the 1959-60 Pool Account:		
Unsold stocks	338,585,565.9	
Stocks which have been sold, but on a deferred price basis.....	84,681.3	
	<u>338,670,247.2</u>	
Net bushels acquired from the adjust- ments of overages and shortages, etc., at country and terminal ele- vators on the 1959-60 Pool Account	2,241,272.9	
	<u>340,911,520.1</u>	
Less: Weight losses in transit and in drying	1,920,523.9	338,990,996.2
		<u>400,876,354.7</u>

These stocks were in store country elevators, in store terminal elevators and mills, in transit and in the custody of Agents. In accordance with accepted accounting practice and consistent with the procedure followed in previous crop years this portion of the inventory has been valued at cost. With respect to the balance of stocks of 61,885,358.5 bushels transferred from the 1958-59 Pool Account as at May 20, 1960 and which were still on hand as at July 31, 1960, cost is the price at which the transfer of unsold stocks from the 1958-59 Pool Account was made as at the close of business May 20, 1960. Relevant to the item in the inventory of 338,990,996.2 bushels which includes 84,681.3 bushels which had been sold, but on a deferred price basis, cost is the Board's initial price paid to producers for the 1959-60 Crop Year which was \$1.40 per bushel basis No. 1 Manitoba Northern Wheat in store Fort William/Port Arthur or Vancouver.

Stocks in the custody of Agents represent wheat provisionally invoiced to those Agents of the Board who are shippers and exporters, and for which the Board will receive a final accounting in respect to the ultimate disposition of these stocks. The Board receives an advance from these Agents for wheat invoiced on a provisional price basis and, as at July 31, 1960, this advance was \$1.40 per bushel basis No. 1 Manitoba Northern Wheat in store Fort William/Port Arthur or Vancouver. With respect to stocks invoiced on a provisional price basis to mills this advance was \$1.60 per bushel basis No. 1 Manitoba Northern Wheat in store Fort William/Port Arthur or Vancouver. As at July 31, 1960, advances received by the Board from those Agents of the Board who are shippers and exporters totalled \$132,149,616.31 as shown in Exhibit I.

OATS AND BARLEY STOCKS—\$53,639,967.18

Stocks of oats and barley held by the Board as at July 31, 1960 and which were in store country and terminal elevators and in transit amounted to 16,607,864.9 bushels and 50,455,891.0 bushels respectively. Of these amounts 804,356.8 bushels of oats and 3,317,677.3 bushels of barley had been sold at established prices, but were undelivered at the year-end date. These stocks have been valued at contract prices and provision has been made for carrying charges to date of delivery. The balance of the coarse grain inventories amounting to 15,803,508.1 bushels of oats and 47,138,213.7 bushels of barley was comprised of the following:

	Oats	Barley
Balance of purchases from producers on the 1959-60 Pool Account	15,793,844.0	47,326,650.4
Stocks acquired from other than producers	40,019.0	1,442.6
	<hr/> 15,833,863.0	<hr/> 47,328,093.0
Less: Weight losses in drying	30,354.9	189,879.3
	<hr/> 15,803,508.1	<hr/> 47,138,213.7

In accordance with accepted accounting practice and consistent with the procedure followed in previous crop years these portions of the inventories of oats and barley have been valued at cost. Cost is the Board's initial price paid to producers for oats and barley in the 1959-60 Crop Year. For oats this price was 60 cents per bushel basis No. 2 Canada Western Oats in store Fort William/Port Arthur and for barley 96 cents per bushel basis No. 3 Canada Western Six-Row Barley in store Fort William/Port Arthur.

Accounts Receivable—\$846,563.33

This item consists principally of amounts due from Agents of the Board in respect to sales which had been completed as at July 31, 1960, but for which final accountings were not received until subsequent to that date. The balance of this amount comprises sundry accounts payable to the Board which were not collected until subsequent to the year-end date.

Grain Trade Memberships—\$19,793.52

The Canadian Wheat Board owns ten memberships in the Winnipeg Grain Exchange, two in the Vancouver Grain Exchange, one in the Winnipeg Grain and Produce Exchange Clearing Association Limited and one in the Lake Shippers' Clearance Association. These memberships are stated at cost less recorded dividends to July 31, 1960.

The Canadian Wheat Board Building, at cost less depreciation—\$340,800.00

Under the authority of Order in Council P.C. 146/2800 the Board purchased The Canadian Wheat Board Building on August 31, 1946 at a cost of \$450,00.00 for the land and buildings.

In accordance with instructions received from the Government of Canada the Board paid to the City of Winnipeg and the City of Calgary grants of \$34,620.99 and \$834.57 respectively, in lieu of realty and business taxes on The Canadian Wheat Board Building and on premises rented by the Board in the City of Winnipeg and in lieu of business taxes on premises rented by the Board in the City of Calgary, but without admitting any liability for such taxes. These grants totalled \$35,455.56 and of this amount \$20,689.75 has been applied to Board operations for the period from January 1, 1960 to July 31, 1960. The balance of \$14,765.81 has been deferred and will be charged to the operations of the Board for the 1960-61 Crop Year. This latter figure is included in the item of \$18,115.59 as shown in the Consolidated Balance Sheet. Depreciation has been provided on The Canadian Wheat Board Building for the year ended July 31, 1960 at the rate of 2 per cent per annum amounting to \$7,800.00. The amounts for depreciation and taxes \$7,800.00 and \$20,689.75 are included in the item of \$232,954.43 as shown in Exhibit VII.

Order in Council P.C. 1960-1343, dated September 29, 1960 authorized The Canadian Wheat Board to purchase from Glenlawn Investments Limited the land and premises commonly known as 189 McDermot Avenue in the City of Winnipeg in the Province of Manitoba. This property was acquired on October 31, 1960.

Under the terms of the same Order approval was given to demolish the buildings located on the above land, and on the land commonly described as 407 Main Street, Winnipeg, and to construct in substitution therefor a new building.

Bank Loans—\$125,809,927.66

During the crop year under review payments were made to producers involving a cash distribution of \$79,107,558.66 consisting of the following:

INTERIM PAYMENT

1958-59 Pool Account—Wheat	\$36,699,415.19
------------------------------------	-----------------

FINAL PAYMENTS

1958-59 Pool Account—Wheat	\$33,919,322.24	
1958-59 Pool Account—Oats	3,153,318.57	
1958-59 Pool Account—Barley	5,335,502.66	42,408,143.47
		<u>\$79,107,558.66</u>

At the commencement of the crop year Board borrowings from the Chartered Banks amounted to \$110,984,281.02 and during the 1959-60 Crop Year the Board's cash requirements remained at a high level in order to carry abnormally large stocks of wheat, oats and barley, to distribute payments to producers and to meet current operating expenses. Consequently, the Board remained in a borrowing position with the Chartered Banks throughout the whole of the 1959-60 Crop Year. Board borrowings from the Chartered Banks reached a maximum of \$133,128,354.12 on July 22, 1960, but had declined to \$125,809,927.66 as at July 31, 1960. Throughout the crop year the interest rate in effect on these borrowings continued at $5\frac{1}{4}$ per cent per annum notwithstanding efforts on the part of the Board to secure a lower rate.

Liability to Agents—\$426,388,445.70

Grain Companies acting in the capacity of Agents of the Board accept deliveries from producers at country elevators on behalf of the Board pay the producers basis the Board's initial price in effect. Settlement is not made by the Board for these purchases until delivery to the Board is completed by its Agents at terminal or mill positions. Liability to Agents amounting to \$426,388,445.70 represents the amount payable by the Board to its Agents for purchases of wheat, oats and barley from producers at country elevator points to July 31, 1960 for which delivery to and settlement by the Board will be completed subsequent to the year-end date.

Amounts Due to Producers

ADJUSTMENT PAYMENTS

There were no adjustment payments authorized on the 1959-60 Pool Accounts for wheat, oats and barley, but in respect to adjustment payments which had been authorized on previous pool accounts there was still outstanding as at July 31, 1960 the sum of \$5,170.21 consisting of the following:

		Outstanding Cheques			
		Wheat	Oats	Barley	Total
1954-55 Pool Account ..	\$ —	\$1,233.35	\$1,468.32	\$2,701.67	
1952-53 Pool Account ..	1,499.74	—	968.80	2,468.54	
	\$1,499.74	\$1,233.35	\$2,437.12	\$5,170.21	

During the period from August 1, 1960 to December 31, 1960, the Board paid \$26.31 in respect to the above liability of \$5,170.21.

INTERIM PAYMENTS

In the crop year under review an interim payment was authorized on the 1958-59 Pool Account for wheat in accordance with the provisions of Section 26(3) of the Canadian Wheat Board Act and Order in Council P.C. 1960-176, February 12, 1960. The payment applied to deliveries of wheat by producers on the 1958-59 Pool Account in the period from August 1, 1958 to July 31, 1959 and amounted to \$36,699,415.19. As at July 31, 1960 there was still outstanding the sum of \$364,752.98 in respect to this and other interim payments

and this amount consisted entirely of cheques in the hands of producers which had not been presented to the Board for payment. The detail of the amount outstanding is as follows:

	Outstanding Cheques
1958-59 Pool Account	\$300,109.52
1957-58 Pool Account	33,862.75
1956-57 Pool Account	8,855.19
1955-56 Pool Account	6,668.79
1954-55 Pool Account	4,167.11
1953-54 Pool Account	5,966.68
1952-53 Pool Account	5,122.94
	<hr/>
	\$364,752.98

During the period from August 1, 1960 to December 31, 1960 the Board paid \$245,422.44 in respect to the above liability of \$364,752.98.

FINAL PAYMENTS

Amounts due to producers on outstanding cheques with respect to final payments are as follows:

	Outstanding Cheques			
	Wheat	Oats	Barley	Total
1958-59 Pool Account ..	\$4,952,252.25	\$43,365.86	\$ 89,836.61	\$5,085,454.72
1957-58 Pool Account ..	48,085.10	4,422.67	9,313.10	61,820.87
1956-57 Pool Account ..	8,274.16	—	2,375.07	10,649.23
1955-56 Pool Account ..	8,578.44	1,359.01	2,287.82	12,225.27
1954-55 Pool Account ..	9,280.76	1,239.38	1,934.95	12,455.09
1953-54 Pool Account ..	6,791.20	2,061.60	2,009.38	10,862.18
1952-53 Pool Account ..	4,504.32	1,379.54	4,659.93	10,543.79
	<hr/>	<hr/>	<hr/>	<hr/>
	\$5,037,766.23	\$53,828.06	\$112,416.86	\$5,204,011.15
	<hr/>	<hr/>	<hr/>	<hr/>

During the period from August 1, 1960 to December 31, 1960 the Board paid \$4,848,852.25 in respect to the above liability of \$5,204,011.15.

Accrued Expenses and Accounts Payable—\$13,694,411.93

This item comprises in the main accrued carrying charges, storage and interest charges to July 31, 1960 together with sundry accounts which were unpaid as at the year-end date.

Special Account—Net Balance of Undistributed Payment Accounts—\$963,266.73

In accordance with the provisions of Section 29A of the Canadian Wheat Board Act the Board was authorized with the approval of the Governor in Council to transfer to a Special Account the balance remaining in specific payment accounts and to use these funds for such purposes as the Governor in

Council upon the recommendation of the Board considers to be for the benefit of producers. The following summary sets forth the details of transactions affecting the Special Account for the crop year under review:

Balance of the Special Account as at July 31, 1959.....		\$ 524,088.22

Advance Payments to Producers

During the crop year 1957-58 the Government of Canada passed the Prairie Grain Advance Payments Act which came into force on November 25, 1957. Under the terms of the legislation the Board was authorized to make

Advance Payments to producers on farm stored wheat, oats and barley at the rate of 50 cents per bushel for wheat, 20 cents per bushel for oats and 35 cents per bushel for barley subject to a limitation of the deliverable quantity of grain and to a maximum amount of \$3,000.00 for each applicant and to recover Advance Payments so made by deduction from the value of wheat, oats or barley delivered by producers subsequent to the date of receiving an Advance Payment.

For the purpose of making Advance Payments to producers the Board was authorized to borrow money from the Chartered Banks, such borrowings and the interest thereon to be guaranteed by the Government of Canada. The result of transactions in respect to Advance Payments to producers for the period from November 25, 1957 to July 31, 1960 is set forth in Part IV of this Report. As at the year-end date there was an amount of \$2,745,263.00 still to be refunded by producers in respect to Advance Payments, but during the period from August 1, 1960 to December 31, 1960 refunds totalling \$2,275,248.00 were received by the Board, leaving a balance still to be refunded in the amount of \$470,015.00. Interest charges on bank borrowings under the Prairie Grain Advance Payments Act to July 31, 1960 amounted to \$1,807,254.58. Of this amount the Government of Canada had remitted to the Board as at the year-end date \$1,789,853.18 in accordance with the provisions of Section 15A of the Prairie Grain Advance Payments Act. The balance of \$17,401.40 together with any bank interest charges incurred subsequent to July 31, 1960 will also be paid to the Board by the Government of Canada in accordance with the legislation.

Provisional Payments to Producers

During the year under review the Government of Canada passed the Prairie Grain Provisional Payments Act which came into force on February 1, 1960. Under the terms of the legislation the Board was authorized to make Provisional Payments to producers for the 1959-60 Crop Year in respect of unthreshed wheat, oats and barley at the rate of 50 cents per bushel for wheat, 20 cents per bushel for oats and 35 cents per bushel for barley. Each Provisional Payment was subject to a limitation of the deliverable quantity of grain and to a maximum amount of \$1,500.00 with a further stipulation that the aggregate of a Provisional Payment to a producer and the Advance Payment made to him in respect of the 1959-60 Crop Year under the Prairie Grain Advance Payments Act shall not exceed \$3,000.00.

For the purpose of making Provisional Payments to producers the Board was authorized to borrow money from the Chartered Banks, such borrowings and the interest thereon to be guaranteed by the Government of Canada. The result of transactions in respect of Provisional Payments for the period from February 1, 1960 to July 31, 1960 is set forth in Part V of this Report. Total advances under this legislation amounted to \$1,025,839.00 and as at the year-end date there was an amount of \$291,211.00 still to be refunded in respect to Provisional Payments. During the period from August 1, 1960 to December 31, 1960 refunds totalling \$227,842.00 were received by the Board, leaving a balance still to be refunded in the amount of \$63,369.00. Interest charges on bank borrowings to July 31, 1960 under the Prairie Grain Provisional Payments Act amounted to \$16,554.14. Of this amount the Government of Canada had remitted to the Board at the year-end date \$14,987.56 and the balance \$1,566.58 together with any bank interest charges incurred subsequent to July 31, 1960 will also be paid to the Board by the Government of Canada in accordance with Section 13A of the Prairie Grain Provisional Payments Act.

STATEMENTS OF OPERATIONS

Wheat Division—1959-60 Pool Account—Exhibit II

As at July 31, 1960 stocks of wheat remaining unsold in the 1959-60 Pool Account and stocks of wheat which had been sold, but on a deferred price basis, amounted to 400,876,354.7 bushels.

In accordance with accepted accounting practice and consistent with the basis of valuation adopted for previous fiscal years this inventory for purposes of the Board's accounts as at July 31, 1960 has been valued at cost. Included in the inventory figure of 400,876,354.7 bushels is an amount of 61,885,358.5 bushels which was the balance of the stocks transferred from the 1958-59 Pool Account as at May 20, 1960 and which were still on hand as at July 31, 1960. In respect to this item in the inventory cost is the price at which the transfer from the 1958-59 Pool Account was made as at the close of business May 20, 1960. Relevant to the balance of the inventory amounting to 338,990,996.2 bushels cost is the initial price paid to producers in the 1959-60 Crop Year which was \$1.40 per bushel basis No. 1 Manitoba Northern Wheat in store Fort William/Port Arthur or Vancouver.

Included in the operating results on the 1959-60 Pool Account to July 31, 1960 is an amount of \$11,193,301.42 representing a portion of the carrying charges received from the Government of Canada during the 1959-60 Crop Year under the provisions of the Temporary Wheat Reserves Act. The total carrying charges received under this legislation for the 1959-60 Crop Year amounted to \$43,604,072.28. The Board recommended and the Governor in Council approved by Order in Council P.C. 1960-835, June 17, 1960 that these carrying charges be allocated as follows:

1958-59 Pool Account—Wheat.....	\$32,410,770.86
1959-60 Pool Account—Wheat.....	11,193,301.42
	<hr/>
	\$43,604,072.28

During the 1960-61 Crop Year the Board will receive from the Government of Canada \$50,430,618.60 for carrying charges under the provisions of the Temporary Wheat Reserves Act and this amount will be allocated between the 1959-60 Pool Account for Wheat and the 1960-61 Pool Account for Wheat. At the date of this Report this allocation had not been determined.

In terms of the foregoing and on the basis of the valuation of the inventory, but without provisions for carrying costs, interest, administrative expenses, etc., beyond the close of the fiscal year the operations of the Board on the 1959-60 Pool Account—Wheat to July 31, 1960 showed a debit balance of \$10,899,712.08. This debit balance should not be viewed as the final result of marketing operations on the 1959-60 Pool Account—Wheat.

Oats and Barley Division—Exhibits III and IV

Under the authority of the Canadian Wheat Board Act and Order in Council P.C. 1959-788, June 22, 1959 the Board was authorized to purchase from producers during the 1959-60 Crop Year oats and barley produced in the designated area and to pay to producers a fixed initial price of 60 cents per bushel for No. 2 Canada Western Oats and a fixed initial price of 96 cents per bushel for No. 3 Canada Western Six-Row Barley, both prices basis in store Fort William/Port Arthur. As at July 31, 1960 stocks of oats and barley remaining unsold in the 1959-60 Pool Accounts amounted to 15,803,508.1 bushels and 47,138,213.7 bushels respectively.

In accordance with accepted accounting practice and consistent with the basis of valuation adopted for previous fiscal years these inventories for purposes of the Board's accounts as at July 31, 1960 have been valued at cost. Cost is the Board's initial price paid to producers for oats and barley in the 1959-60 Crop Year. With respect to oats this price was 60 cents per bushel basis No. 2 Canada Western Oats in store Fort William/Port Arthur and with respect to barley this price was 96 cents per bushel basis No. 3 Canada Western Six-Row Barley in store Fort William/Port Arthur.

On the basis of the valuation of the inventories, but without provisions for carrying costs, interest, administrative expenses, etc., beyond the close of the fiscal year the operations of the Board on the 1959-60 Pool Accounts for oats and barley to July 31, 1960 showed a credit balance on oats of \$376,910.43 and a credit balance on barley of \$1,388,306.88. These results should not be viewed as the final results of marketing operations on the 1959-60 Pool Accounts for oats and barley.

Schedule of Administrative and General Expenses—Exhibit VII

The total expenditures under this heading for the crop year under review amounted to \$3,264,509.78 comprising expenses applicable to the Board's offices at Winnipeg, Calgary, Vancouver, Montreal, London (England) and Rotterdam (Netherlands). Details of these expenditures and the allocations to Board operations are set forth in Exhibit VII.

The Report of the Board's Auditors for the year ended July 31, 1960 is contained in Part III of this Report. Part IV includes the Auditors' Report and Financial Statement in respect to the administration of the Prairie Grain Advance Payments Act. Part V includes the Auditors' Report and Financial Statement in respect to the administration of the Prairie Grain Provisional Payments Act.

In this Report and in the Financial Statements we have endeavoured to describe the administration of policy with respect to wheat, oats and barley for the year ended July 31, 1960.

In conclusion we would like to record our appreciation for the loyal and conscientious service rendered by the officers and staff of the Board.

All of which is respectfully submitted,

W. C. McNAMARA
Chief Commissioner

W. RIDDEL,
Assistant Chief Commissioner

W. E. ROBERTSON
Commissioner

J. T. DALLAS
Commissioner

1953-54 Pool Account.....	730.88
1952-53 Pool Account.....	540.65
1951-52 and prior Pool Accounts....	11,450.00
	<u>129,185.44</u>

(b) Coarse Grains:

1958-59 Pool Account—Oats.....	32,500.46
1958-59 Pool Account—Barley.....	51,620.19
1957-58 Pool Account—Oats.....	7,191.35
1957-58 Pool Account—Barley.....	8,308.47
1956-57 Pool Account—Oats.....	3,650.84
1955-56 Pool Account—Oats.....	726.39
1955-56 Pool Account—Barley.....	898.97
1954-55 Pool Account—Oats.....	694.74
1954-55 Pool Account—Barley.....	676.87
1953-54 Pool Account—Oats.....	363.30
1953-54 Pool Account—Barley.....	358.16
1952-53 Pool Account—Oats.....	198.64
1952-53 Pool Account—Barley.....	204.91
1951-52 and prior Oats and Barley Pool Accounts.....	750.00
	<u>108,143.29</u>

3. Allocations authorized by Orders-in-Council P.C. 1960-836 and P.C. 1960-837 from Special Account—Undistributed Payment Accounts in partial payment of administrative and general expenses incurred in respect of:

The Prairie Grain Advance Payments Act.....	60,000.00
The Prairie Grain Provisional Payments Act.....	5,000.00
	<u>65,000.00</u>

\$ 3,264,509.78

Mr. McNAMARA: I suggest we start at page 7, of the supplementary report and deal with oats and barley, then review the feed mill policy for western Canada, and then discuss the question of the supply of feed grain for the Canadian market.

Agreed.

MR. EARL:

1959-60 Pool Account—Oats

1. Receipts and Disposition

RECEIPTS

Receipts of oats in the 1959-60 Oats Pool were 29,012,431 bushels.* This total included 23,660,976 bushels delivered by producers from August 1, 1959 to July 31, 1960; an additional 40,019 bushels acquired from others than producers; and 5,311,436 bushels transferred from the 1958-59 Pool Account to the 1959-60 Pool Account.

DISPOSITION OF STOCKS

Completed sales from the 1959-60 Pool Account from August 1, 1959 to January 27, 1961 were 28,980,710 bushels. These sales plus weight losses in drying, amounting to 31,721 bushels, accounted for total deliveries to the 1959-60 Pool Account. Therefore, the 1959-60 Oats Pool was closed without transfer of stocks or futures contracts to the ensuing Pool Account.

THE ACTING CHAIRMAN: Are there any questions on this item on page 7?

MR. BOULANGER: (*Translation*): This means that the 28 million or almost 29 million bushels were handled by the wheat board.

Mr. McNAMARA: Yes, that is right.

MR. BOULANGER: (*Translation*): What is the domestic consumption of oats? I think you said a while ago it was 36 million bushels.

Mr. McNAMARA: You mean out of commercial channels; I will give some figures as follows: from August 1, 1959 to June 15, 1960 commercial disappearance of oats amounted to 38.8 million bushels; and from August 1, 1960 to June 14, 1961, this year, commercial disappearance of oats amounted to 32.5 million bushels. This does not include farm distribution, on western farms. If you look in our annual report at the supplementary table as at July 31, you will see the Canadian oats supply and disposition. It shows the supplies, then farm, commercial, production, total supplies, and disposition by years starting at 1935-36.

MR. BOULANGER: (*Interpretation*): I do not know whether or not you are acquainted with the criticism which has been voiced in the east with regard to the price paid by the eastern consumers for western oats.

Mr. McNAMARA: Yes. I understand that there has been some feeling in eastern Canada that the price of western oats is high. This opinion is not shared by the producers of oats in western Canada. I think, however, there has been some misunderstanding in eastern Canada as to the cost of oats in the eastern Canadian market as compared to the cost of oats across the line—United States oats. I understand that some of our eastern feeders, and a lot of eastern dealers, are suggesting the price they are paying for western Canadian oats is excessive when compared to the price United States feeders are paying across the line. I have some tables we prepared in this regard. I can make them available to the committee. This is a memorandum prepared by our coarse grains sales department on June 23rd.

The ACTING CHAIRMAN: Is it agreeable this be put on the record?

Mr. MUIR (*Lisgar*): Could this be attached to today's minutes of proceedings and evidence?

Mr. McNAMARA: I would like to make the point first. This is U.S. oats, 40 pounds 2 White oats which we consider equivalent in value to our Western No. 1 Feed oats. The sales price—the cost of oats—delivered to Portland, Maine, is as follows: Chicago July oats—June 23rd, $67\frac{1}{2}$ cents per bushel. Premium & Fob charges 05 cents per bushel. Freight to Portland, Maine, $18\frac{3}{8}$ cents per bushel. The total delivered price is $90\frac{5}{8}$ cents per bushel. Taking oats of U.S. origin and delivering them to C.I.F. Montreal, again Chicago July oats—June 23, $67\frac{1}{4}$ cents, premium and f.o.b. 5 cents, which brings the U.S. price to $72\frac{1}{2}$ cents per bushel. Then converting that to the same Canadian measure it would increase the price to $76\frac{1}{2}$ cents, or in Canadian funds, $78\frac{3}{4}$ cents. The freight is $10\frac{1}{4}$ cents per bushel, duty four cents per pound, which would make the price of United States oats in Montreal 93 cents per bushel in Canadian funds C.I.F. Montreal.

Now, take Canadian 1 Feed oats to C.I.F. Montreal, June 23rd. Our asking price in store lakehead was $78\frac{1}{4}$ cents per bushel, the F.O.B. and freight charges again are 13 cents per bushel and the freight subsidy $8\frac{1}{2}$ cents a bushel; so the actual cost of landing the feed in Montreal from Fort William, after the government freight subsidy, works out in Canadian funds at $82\frac{3}{4}$ cents per bushel, which compares with 93 cents for the delivery price of American oats in Montreal.

There is one other comparison we worked out, and that is the price to C.I.F. Moncton. Canadian No. 1 Feed oats can be delivered there for $84\frac{3}{4}$ cents per bushel as compared to American oats from Portland, Maine at 93 cents per bushel.

For anyone who wishes this information in tabular form it is as follows:

<i>U.S. 40 lb. 2 White oats, (equivalent in quality to 1 Feed Oats)</i>		
<i>Delivered Portland, Maine</i>		(per bushel)
Chicago July Oats—June 23rd.....	\$	$.67\frac{1}{2}$
Premium and Fob.....	.05	
Freight.....	$.18\frac{3}{8}$	$.23\frac{3}{8}$
	$.23\frac{3}{8}$	\$ $.90\frac{5}{8}$
<i>U.S. oats to C.I.F. Montreal</i>		
Chicago July oats—June 23rd.....		$.67\frac{1}{4}$
Premium and Fob.....		.05
U.S. Funds—32 lb. oats.....		$.72\frac{1}{4}$
U.S. funds—34 lb. oats.....		$.76\frac{1}{2}$
Canadian funds.....		$.78\frac{3}{4}$
Freight.....		$.10\frac{1}{4}$

Mr. MILLIGAN: I do not think that most of us in the east are thinking of a cheap feed policy as being in the best interest of economy; but how does the price we are paying for our grain in eastern Canada under the wheat board regulations compare to what the feed mills are paying the farmers for their grain under the present setup?

Mr. McNAMARA: We have some statistics which we will be filing with the committee indicating the price the feed mills are paying for western grain they are buying from the producers. Whether they buy No. 5 or No. 2 Northern makes no difference to the feed mills; but in most cases the feed mills are paying a price in excess of the board price.

Mr. MILLIGAN: In excess of the initial payment or the final payment price?

Mr. McNAMARA: In the case of barley it is mainly in excess of the final payment. In the case of oats, we had a very good payment last year. In this case it was below the final payment, but in excess of the initial payment.

I think we should give this information to the committee now in respect of the feed mills and eastern feed, since it seems it will be difficult to separate these two problems.

Mr. BOULANGER (Interpretation): I did not quite get the comparison between the price landed at Portland and the price in Montreal. I do not think many eastern farmers buy American oats.

Mr. McNAMARA: No. The reason I filed that is because suggestions have been made to us—and I understand some of the representatives of the trade in eastern Canada have been suggesting this—that we should be authorizing the importation of American oats into Canada because they can be imported and would be a cheaper feed for the eastern Canadian feeder than Canadian western oats.

Mr. BOULANGER (Interpretation): But I feel the eastern consumer is interested in being treated as fairly as the western producer who can now buy or sell his oats on the free market.

Mr. McNAMARA: I am in complete agreement. I would like to preface my further remarks immediately, in respect of the eastern feed situation, by stating that we realize the importance of the eastern market to the western producer. Insofar as wheat is concerned our main marketings are in the United Kingdom and western Europe; but insofar as western coarse grains are concerned, our main market is eastern Canada. We are just as anxious, in the case of oats and barley, to have satisfied customers in eastern Canada as in the wheat markets of the world. I think the information we are about to make available to you about board asking prices and cost of distribution, will indicate to you a lot of the problems the eastern feeder is confronted with at the present time in purchasing his western coarse grains. I suggest to you that the western producers when faced with the problem of marketing in western Canada a number of years ago organized through their own efforts efficient machinery for the marketing of their grains. I think the eastern consumer in the buying of his western coarse grains could materially help himself reduce his cost factor if he would organize and try to deal direct with the producer organization in western Canada or with the trade. A lot of these charges or criticisms in eastern Canada cannot be contributed to the asking price that the Canadian wheat board is asking at the lakehead. There are costs involved in the movement which the eastern consumer is paying for feed grain which considerably enhance the price he is paying at the present time.

Mr. MILLIGAN: What I am concerned about is the policy by which we in the east are being asked to buy at wheat board prices, whereas the feed mills in western Canada are on their own and can go out and buy at whatever price they can make the best deal from the producer.

Mr. HORNER (*Acadia*): Only within their own province.

Mr. McNAMARA: Yes, only within their own province. But I suggest there has been no change in this.

I think there is a feeling in eastern Canada, as a result of the new feedmill policies, that feed mills in western Canada are now procuring their coarse grains at a lower price than they previously did. This is not the case. We never have been able to exercise price controls on the feed mills in western Canada. We have no power to control prices within a province.

Our previous battle, if I may call it that, with the feed mills was in an attempt to enforce quota regulations, but the fact we now have made it possible for these feed mills to buy outside the quota regulations has not influenced their prices for which they are paying for western feed, except as we can indicate by the figures we are now circulating, that the price which the mills are now paying for the feed from western producers is at a higher level than a year ago, prior to this committee considering this whole feed mill problem.

Mr. MILLIGAN: From the last reports I have in Hansard, the prices paid by feed mills were from 40 to 45 for oats, 50 to 52 for barley, and 90 to 96 for wheat.

Mr. McNAMARA: They are higher now.

Mr. MILLIGAN: But that does not compare with the figures you were quoting.

Mr. McNAMARA: No; however, you must remember the price I was quoting started off from Fort William, and to the price that oats are sold for in Winnipeg, you must add the cost of transporting that to Fort William. The freight charges must be paid. Then, of course, in moving them east, there are additional charges, the bulk of which are offset by the government pre-assistance policy. However, you cannot compare the price at an inland point such as Regina or Saskatoon—the price he receives at the farm—with the Fort William price, because these additional charges have to be added to that price to get your Fort William price.

Mr. MUIR (*Lisgar*): I would suggest that the argument Mr. Milligan has put up is that he understands the feed mills, under the new setup, are robbing the farmers, and he would like to have the same privilege.

Mr. MILLIGAN: Nothing of the kind. I am proud of the wheat board operations. It has set an example in marketing, and I think we can take a good lesson from it. I do not want to see anything interfere with the operations of the wheat board. I think I have a clipping somewhere, where the Quebec feed dealers have asked for the elimination of the wheat board, and that is something I do not want to see happen. It would not be in the interest of the feeders across Canada, nor the producers.

I am afraid this thing is going to snowball throughout Ontario and through the eastern part of Canada, and that they will ask for the same price as the feed mills pay in western Canada, which I do not think we should have. It seems to me that it would weaken your operations.

What difference in sales has it made up to the present time, or have you any figures?

Mr. McNAMARA: For eastern Canada?

Mr. MILLIGAN: Since these regulations came in last fall—and I am referring to sales of oats and barley.

Mr. McNAMARA: Except for the decline I referred to in the export demand, on the commercial disappearance of barley, from August 1st to June 14th, 1961, there has been 76 million bushels as compared to 97 million bushels last year.

However, the bulk of that difference is in the decrease in the export—and the same applies to oats. Our commercial disappearance of western oats has been 32.5 million as compared to 38.8 million last year. But, the exports are down about the 6 million bushels.

Mr. MILLIGAN: I realize the western farmers should be able to buy their own grain, but there should be some controlling influence so that they would at least pay a minimum of the wheat board initial payment, plus the final payment, and that would equalize it. I do not think the western farmers should pay freight to Fort William, and then back again. I think there should be a stabilizing factor which would stabilize it in both the east and west. We both are producing livestock. I noticed in another report that the hatching of chicks are up 30 per cent in western Canada due to these feed mill regulations, and they are putting out laying mash for \$36 a ton in comparison to \$76 a ton in Ontario.

Mr. McNAMARA: I suggest you are confusing farm feeding in western Canada as related to the operation of the feed mills. We have not reliable statistics, as yet, as to the volume of oats and barley which feed mills are processing, but it is still under 10 million bushels. We will have these figures at the end of July. Whereas, farm feeding in western Canada, as the statistics indicate, are millions and millions of bushels. There is no way you can prevent a farmer from feeding his own grain, particularly when he can only market so much under our regulations. If he has a surplus, he is feeding that surplus, and this has not changed as a result of our new policy.

Mr. MILLIGAN: I think it is increasing all the time.

Mr. McNAMARA: It is not. I do not take your criticism as being unwarranted at all, because as one of a group which is responsible for marketing western oats and barley to the best advantage, we are normally concerned with you in having a satisfactory market in eastern Canada. I think we must accept some responsibility in this regard, because it is very evident that you and the other eastern feeders are not well informed with regard to our pricing policies. I respectfully suggest that the solution to this problem is organization and improved methods of buying on the part of the eastern Canadian, because I am satisfied that a saving can be realized if the eastern consumer would work towards the best advantage. I hate to suggest that my people came originally from eastern Canada, but of all the markets in the world, I suggest that the eastern buyer is away behind the times, as compared to any other market in the world today.

Mr. MILLIGAN: I have received a few complaints from the U.C.O. Have you received any?

Mr. McNAMARA: Yes, we have, and our minister has received numerous complaints. A lot of publicity has been given throughout eastern Canada as to our operations the last few months. By colleague, Mr. Robertson, has just returned from attending a meeting in Quebec, where this problem came up. He can speak on this meeting. However, I do think—and I want to say this quite frankly to the committee—that as merchandisers we have some responsibility for this eastern market, and I think we have been somewhat remiss in not acquainting the feeders in eastern Canada with more of the facts, because there has been a lot of propaganda spread around which is not related to the actual situation.

Would you care to comment on this, Mr. Robertson?

Mr. ROBERTSON: Well, Mr. Chairman, first there is this one other comment I would like to add to what Mr. McNamara said about feeding out west. One of the big operations is the feed lot. The feed lot operator always has been as free of wheat board quotas and controls as the farmer feeding his own grain

right on the farm. And even though you closed every feed mill in western Canada, the feed lot operator, which I think is bigger than the feed mill operator, would go on. As far as the Wheat Board Act is concerned, we have no control over that feature of the cost of feed in western Canada.

Now, as far as the meeting that I was at in Saint-Hyacinthe is concerned, Mr. Boulanger was there, and it was a very representative meeting. There were about 100 there from all parts of Quebec. They were composed of feed mill operators, feed lot operators, farmers and feed dealers. The general complaint was that their feed was costing them more than it had been, that the product they had to sell was lower, and that they were caught in a cost-price squeeze, which seemed to be similar to what I have heard producers in western Canada saying. They say they are up against a similar problem in the sale of their grain.

At this discussion many of the points which Mr. McNamara has already explained were brought up, but there was one thing for which I could not get an explanation at the meeting. It seemed that feed consumers were paying prices for oats and barley that greatly exceeded any prices we could calculate might be the delivered cost in Montreal and the St. Lawrence river area. Even last fall when fair prices prevailed there seems to have been a cost factor reflected in the cost of oats and barley reaching Montreal and the St. Lawrence area, more particularly from there to the buyer who was ultimately going to use them. There seems to be a big increase in price and I do not know the reason for that. Neither was I able to find it out at the meeting. No one seemed to have an explanation for it. That seemed to be where a lot of the criticism was being directed back to the board.

The figures I had at that time indicated that last fall, when we were at times a little short of supplies at the Lakehead, our prices did increase, but our Lakehead prices never increased anything like the prices to the man who was feeding the grain down here, even after allowing for transportation and the refund of the subsidy.

As I say, there was a moderate increase in the price at the Lakehead. At the most it was \$2 or \$3 a ton on oats, and maybe the same on barley at one time, but those prices settled back again. Another thing which I gathered at the meeting was that barley prices were satisfactory. It was the oat prices which they considered were high, because at one time oats were selling higher than barley at the Lakehead.

The other complaint was in connection with No. 5 wheat, and when they did obtain No. 5 wheat, it was priced higher, compared to a year or two ago. Prices of No. 5 wheat advanced as supplies diminished, and they have diminished to the point where we have virtually no stocks of No. 5 wheat in the west. That problem of the increasing price of No. 5 wheat, and then of No. 4 wheat, was something about which we could do nothing, because if we have not got the stocks we cannot supply them with those grades.

That, to me, was the sum and substance of what was a four-hour meeting. There was a very wide range of discussion, and one of the other things mentioned was that there should be some sort of an open market arrangement for oats and barley on the domestic market. That is something which I do not know how we could operate. It comes out of the thought Mr. Milligan has mentioned, that because of the western feeder being able to get oats, not quoted by the wheat board, the man down here should be able to do the same thing. Generally, that is the problem and I do not see an answer to the situation, other than the one thing that there is this wide gap after they get down here until they get to the feeder. Whether that is due to heavy transportation costs or not, I am not aware, but that is one place where the prices had been enhanced more than at the Lakehead.

Mr. MILLIGAN: I should like to thank Mr. Robertson for his statement, but I feel the board can help up out to some extent. I was buying oats all winter in the Ottawa district at \$65 a ton, and that was due to the fact we did not have stocks and supplies down here, and so we were depending upon a speculative market. Not enough oats were brought down here last fall. If we had more elevator space for feed grains in the east, instead of our elevators being full of export grain, we would be in a much better position, but I think we are at the mercy of the trade at times and they take advantage of us. Has Mr. McNamara the answer to that? Perhaps we should change our buying policy, by buying in the fall and storing this grain.

Mr. McNAMARA: Just on that point, you will notice later in the supplementary report, when dealing with general comment on oats marketing, we do admit that for a time last year the supply of oats was too short. There were a number of reasons for this. At this time about a year ago there was a very limited demand for oats, particularly in eastern Canada. It looked as if the eastern feeder was expecting a sharp reduction in the price of oats, and stayed out of the market. Nevertheless, we were in the position last fall where the supply of oats which we had available at the Lakehead was too low in relation to the demand.

In our annual report we make reference to this, and it was coupled with the endeavour which the board made at the end of the crop year to equalize producers' opportunities in the west. In our effort to equalize, we congested our pipeline. We took in too much wheat and did not allow for the free movement of grains which were in demand. That was coupled with the usual demand for Durum in the fall, and we had to take advantage of a lot of transportation to move this Durum, which resulted in a tight position in oats and barley in the fall period.

I should like to make two other points. It is far from me to take the role of trying to defend the grain quotas, but you must remember that the manner in which the eastern feeder proceeds makes it very difficult for the western trader to anticipate the demand. When a trader takes oats from the port of Fort William and moves them down, he has to finance them until the eastern feeder makes up his mind he wants to buy them.

On more occasions than one dealers in western Canada have moved grain into eastern Canada and, for reasons best known to the Canadian feeders, they have not always picked up these supplies with the result that traders at times take heavy losses. Naturally, therefore, they are reluctant to move into position a larger quantity than they anticipate you people are going to buy. I may say I am speaking for our whole board when I say I think our hope is to market western grain to the advantage of the people producing it, and therefore I think some of the steps our minister is taking in this report are going to be beneficial.

Mr. Hamilton has in mind setting up a permanent liaison committee on which eastern feeders will be represented, and which will meet at regular intervals with our board, so that we can be kept more closely appraised of eastern requirements from time to time, and I hope we shall be able to take action fast enough to resolve the difficulties we expect next fall. You will remember that the previous year we have no complaints at all, and I suggest last year's experience was an exception and I hope it will not be repeated. I also understand that our minister has announced the advisability of having on our advisory board a representative of the eastern consumers. This would be most helpful because this member would have access to information we have available on our marketing position and he would be able to bring to our attention the problems of the eastern feeder. As you know, I have recently

returned from extensive travelling in the Far East, and I think one of the papers made the suggestion, which I think is quite appropriate, that we should probably be looking towards the Near East, not always to the Far East. We certainly intend to do this.

Mr. FORBES: Mr. Milligan has overlooked one point, that they have the advantage of 10 cents or 15 cents a dozen on eggs, and 3 cents or 4 cents a pound on pork, and about the same on beef. That surely ought to offset part of the freight rate to get the feed down here.

Mr. BOULANGER (*Interpretation*): Mr. Robinson stated a moment ago that there was something he did not understand in the complaints made by the eastern feeders. I think I can provide an explanation. On February 24 the minister gave some prices for oats, barley and wheat. He gave prices as follows: oats in the west, 55 cents, whereas in the east it was 81½ cents. The 55 cents was the non-quota mill price. It did not include the 14 cents freight, which made 95 cents in all. The price given by the minister in respect of barley was 65 cents in the west, while the price in the east, with freight added, was \$1.45.

As far as wheat is concerned, the price given by the minister was 95 cents, while the asking price in the east, with freight charges added, was \$1.84. This makes a difference for oats of 48 per cent, barley 54 per cent and wheat 67.5 per cent.

Let me quote the following:

Lowest prices quoted in Manitoba were 40 cents a bushel for oats 2 CW; 67 cents for barley 3 CW; and 90 cents for wheat No. 2 Northern...

In Alberta, the inquiry quoted prices of 45 cents for oats, 65 cents for barley, and \$1.05 for wheat.

In Saskatchewan the prices were lower: for barley, 55 cents; for wheat 85 cents; oats ranging from 40 cents upwards. I could quote from more clippings.

That is the reason why eastern farmers are complaining. At the present time eastern farmers are buying corn on the U.S. markets at a price which is lower by \$7 per ton. It has been claimed that we will be buying from \$12 million to \$14 million worth of corn in the United States, whereas in our elevators we have 400 million bushels of wheat of which we cannot dispose and on which, in any event, we are paying storage charges.

Mr. MUIR (*Lisgar*): I wonder if Mr. Boulanger would permit a question. Who is paying storage on the 400 million bushels of wheat?

Mr. BOULANGER: The taxpayers.

Mr. MUIR (*Lisgar*): The taxpayers pay storage on anything over 178 million bushels of wheat, while the western farmers pay storage on 178 million bushels. That is the point I wish to make.

Mr. BOULANGER: Last year it cost \$400 million to pay the storage.

Mr. HORNER (*Acadia*): Do you think this should not be?

Mr. BOULANGER: Do not try to catch me. The farmers in the east have not got their own grain. Who is paying the storage?

Mr. HORNER (*Acadia*): In the west they are paying storage on their own grain. They are building granaries.

Mr. MUIR (*Lisgar*): I would just like to know, Mr. Chairman, what is the freight pay-back from the government to the eastern feeder, and how that compares with the \$20 million?

The CHAIRMAN: Mr. Boulanger, I have been listening for some time. There is some information on the record, but do you have a question on that?

Mr. BOULANGER: I would like to know what the Canadian wheat board thinks about the complaints from eastern farmers.

Mr. McNAMARA: I tried to explain it earlier and I do not think you are conversant with the facts. You are comparing prices western farmers would get if they sold their own grain at a central point, say in western Canada, with laid-down prices in eastern Canada. This grain has to be transported thousands of miles, and while it is true that the freight subsidy on the movement, of \$5 a ton, is absorbed by the dominion government, you are overlooking the cost of moving the grain, say, from Saskatchewan to Fort William, paying 20 cents to 25 cents per cwt., which freight is paid by the producer in western Canada. You cannot compare the prices paid by a feed mill in Saskatchewan with laid down prices in Montreal. These comparisons are not related at all.

The other point which I do not think you appreciate is that in so far as price is concerned on the grain produced, say, in the western provinces, that is barter and sale between producers and feed manufacturers within the prairie provinces, it is entirely outside the control of our board. With your permission I would like to ask our solicitor to just point out the regulations under our act, where our powers begin and stop. We cannot control prices at which grain is sold from one producer to another within western Canada. This is not related to our operations at all.

Mr. MONK: Mr. Chairman, this is quite a large question. I will try to deal with it as shortly as I can. It is a constitutional question. The powers of the dominion, in so far as they are related to trade and commerce, are confined to controlling interprovincial transactions, interprovincial trade and export trade. The dominion also has power over railways and over what are loosely called, in the B.N.A. Act, "works for the general advantage of Canada."

Railways and elevators and feed mills have all been declared works for the general advantage of Canada, and it is under these provisions that the Canadian Wheat Board Act is framed. The scheme of control is that it prevents the movement of wheat, oats or barley out of a province except with the permission of the board or by the board, and this drives the grain into the hands of the Canadian wheat board. Now, the board has no control over transactions wholly within a province, I mean sales of grain wholly within a province. To that end some provincial legislation has been enacted, but it has not been enforced. Property and civil rights within a province are wholly within provincial jurisdiction. Consequently they are outside the control of the board. You may ask me, what of our control over feed mills. Now, the control which we exercise over feed mills is done under our quota regulations, which have nothing to do with price or contract. They have merely to do with the movement of grain into or out of the mill. While we can prevent or control the physical movement of the grain into a feed mill, we have no control over the price which may be paid for it.

Mr. BOULANGER (*Translation*): Why should not the wheat board adjust the price of wheat to a level, so that the eastern farmer could buy Canadian wheat at the same price for which he buys American corn?

Mr. McNAMARA: You ask why should we reduce the price of western Canadian wheat to the level of corn, if we can sell Canadian wheat at the price we are now securing for it? Under our act we are not set up to try to subsidize the eastern consumer. That is a responsibility which does not rest on the Canadian wheat board. Our act directs us to merchandise the grain

produced by western producers to the best possible advantage of the western producers. And as I said earlier, we realize that we must have satisfied customers, and that the largest market for our oats and barley is eastern Canada. But that is not the case with wheat. We could sell larger quantities of low grade wheat if we had it available. But we are not selling to the eastern consumer a one fraction of a cent higher than we can sell the same goods to a buyer overseas.

Mr. BOULANGER (*Translation*): Why should we not have two prices then?

Mr. McNAMARA: Do you ask why the western producer should not sell below what other people will pay, such as the eastern feeder. I think the members who are asking for a two-price system are suggesting that the eastern consumer should pay a higher price than the export price, not a lower one.

Mr. HORNER (*Acadia*): An eastern producer or purchaser may order a carload of oats or barley from the wheat board and have it delivered to the siding closest to him, can he not?

Mr. McNAMARA: Yes, at our price; we set the price, but the transaction is actually handled by the trade acting as our agent. There have been such cases. I remember a few years ago when this was reported to a meeting of our advisory committee, and quite recently when a group of Ontario producers arranged to purchase from one of our agents—from a farm co-operative in the west—12 to 15 carloads of oats, and they moved the oats into Ontario, and they got a better price than they had been receiving; that is, they got it from \$8 to \$10 a ton cheaper than the local people were paying. The price of oats dropped immediately in that area, until these oats were consumed. The fact remains that if the eastern consumer would only organize, he could buy to better advantage, and he could substantially narrow the gap between our selling price and the price that is being paid in eastern Canada.

Mr. HORNER (*Acadia*): If they went in as a group, they could buy in larger orders.

Mr. McNAMARA: They could buy at a time when the market was favorable to them, and they could move the grain down into storage and take advantage of lake freight and distribution methods in eastern Canada. Certainly it would materially reduce the price of western feed to the consumer in eastern Canada. I suggest that the eastern feeders should organize and arrange this.

Mr. BOULANGER (*Translation*): He would still have to pay the storage.

Mr. McNAMARA: Yes. They are paying the storage now.

Mr. PASCOE: But the Freight Assistance Act applies in those cases.

Mr. McNAMARA: Yes; they get the benefit of the freight assistance.

Mr. MILLIGAN: Does the futures market increase the cost of grain in the east?

Mr. McNAMARA: Not necessarily; at times. Due to the limited operation we had available in a period last fall, the futures market rose to a level which was not beneficial to the western producers or the eastern consumers. This was because we did not have the transportation available at the time.

Mr. MILLIGAN: Does the futures market give any better price to the western producer?

Mr. McNAMARA: This is a very debatable point.

Mr. MANDZIUK: Would it be a solution if the eastern feeder had a buying agency just as we have a selling agency in the wheat board and buy in bulk quantity for distribution?

Mr. McNAMARA: I think the eastern Canadian market is the only unorganized market that purchases grain in volume in the world. By organizing I certainly think they could materially improve the efficiency and reduce the cost. I know for a fact that some of our western farm organizations which have worked closely within the federation of agriculture have made this suggestion to the eastern consumer in the past. I believe they offered funds to help them finance storage and other facilities. For some reason or other unknown to me the eastern consumers have not seen fit to take advantage of these suggestions. I think a lot of educational work has to be done. We have some share of responsibility, but the real core of the problem lies in the hands of the eastern consumer himself.

Mr. BOULANGER (*Interpretation*): There is one sure thing, and that is that the eastern farmer is dependent on the Canadian wheat board whereas the others are not.

Mr. McNAMARA: What do you mean by the others?

Mr. BOULANGER (*Interpretation*): Farmers in the west.

Mr. McNAMARA: I think the western farmer is dependent on the wheat board today in marketing his coarse grains.

Mr. BOULANGER (*Interpretation*): Why does the farmer from the east have to go through the Canadian wheat board?

Mr. McNAMARA: Because the government of Canada has decided, no doubt with the support of the western producers, that they want the western grain market to operate through a central agency such as the Canadian wheat board.

Mr. BOULANGER (*Interpretation*): I can understand without any trouble at all that you have to apply legislation as it is; but I do not understand, and do not approve, of the Canadian wheat board standing up only for the western Canadian farmer.

Mr. HENDERSON: We do not stand up for the western farmer.

Mr. NASSERDEN: Would Mr. McNamara comment on this: suppose I am an eastern feeder and want to buy a carload of barley or oats from the Canadian wheat board through an agent. Approximately how long would it take from the time I placed an order for the boxcar to get delivery of that grain?

Mr. McNAMARA: It would depend on what area you are in? Are you speaking about a carload by rail? This is not an economical way for you to purchase it. You should have it shipped by water. I would think it would take two or three weeks, depending on the locale in western Canada.

Mr. SOUTHAM: I think Mr. McNamara brought out a good point when he suggested the minister might set up a liaison committee on which I would assume that eastern representatives would work in harmony with the Canadian wheat board with the result they would analyse this cost price factor that we are speaking about here. I think this is something we could work out to advantage possibly next year. I think it is a very good suggestion and, possibly, it will help eliminate some of these problems. They likely will recommend some type of organization here to work to better advantage.

Mr. McNAMARA: I am very hopeful that this action the minister has taken will assist in this program. Both the liaison committee as well as having an eastern consumer on our advisory board, is a step in the right direction, and it will be helpful to a better understanding of this problem.

The CHAIRMAN: If there are no further questions under No. 1, we will proceed to No. 2.

Mr. EARL:

2. 1959-60 Pool Account—Oats

The following table shows the operating results of the 1959-60 Pool Account from August 1, 1959 to the closing of the pool, January 27, 1961:

	Bushels	
1. Oats acquired by the board:		
(a) Producers' deliveries, August 1, 1959 to July 31, 1960.....	23,660,976	
(b) Oats otherwise acquired ¹	40,019	
(c) Purchased from 1958-59 pool account—oats..	5,311,436	
Total oats acquired.....	29,012,431	
	(Value)	(Value)
2. Cost of oats acquired.....		\$ 16,854,491
3. Proceeds of sales—August 1, 1959 to January 27, 1961.....		22,552,129
4. Gross surplus as at January 27, 1961.....		5,697,638
5. Operating costs—August 1, 1959 to January 27, 1961:		
(a) Carrying charges including terminal storage.	\$ 1,624,978	
(b) Interest and bank charges.....	(2,032)	
(c) Freight recovery on export oats.....	(8,249)	
(d) Drying charges.....	32,566	
(e) Brokerage and clearing association charges..	5,662	
(f) Administrative and general expenses.....	143,604	
		1,796,529
6. Surplus on operations of the board on 1959-60 pool account—Oats, for the period August 1, 1959 to January 27, 1961.....		\$ 3,901,109

¹ Purchases from non-producers at the board's initial prices basis in store Fort William/Port Arthur.

The CHAIRMAN: If there are no questions on this matter, we will proceed to No. 3, Operating Costs.

Mr. EARL:

3. Operating Costs

Net operating costs applicable to the 1959-60 oats pool, including carrying charges, amounted to \$1,796,529. The principal item in operating costs consisted of carrying charges of \$1,624,978, or 6.8678 cents per bushel on producers' deliveries. Interest and bank charges and freight recovery on export oats resulted in credit items of \$2,032 and \$8,249 respectively. Drying charges were \$32,566, while brokerage and clearing association charges were \$5,662. Administrative and general expenses amounted to \$143,604, or .6069 cent per bushel.

The CHAIRMAN: Are there any questions?

Mr. HORNER (Acadia): In other words, the wheat board handled something like 29 million bushels of oats and, more than likely, there was something like 400 million bushels of oats fed on the farm by the farmers themselves. Is this a proper interpretation of the tables?

Mr. McNAMARA: I think the 400 million is a little high. Was not the production about 200 million?

Mr. HORNER (*Acadia*): It is table 5.

Mr. McNAMARA: Oh, yes. This is counting all oats in Canada, and includes eastern oats.

Mr. HORNER (*Acadia*): I see.

Mr. McNAMARA: This is the total supplied.

Mr. HORNER (*Acadia*): Western oats would be about half of that.

Mr. McNAMARA: I thought we had a table on that here somewhere. Yes, it is table 3— the production of oats. The figure is 263 million.

Mr. HORNER (*Acadia*): In other words, there would be about 200 million bushels that would be fed on the farm by the farmers themselves?

Mr. McNAMARA: Yes, as compared to the 29 million marketed.

Mr. HORNER (*Acadia*): Actually, you handled about 10 per cent of the oats grown by western farmers?

Mr. McNAMARA: Yes.

The CHAIRMAN: Can we consider No. 4 as read?

Some HON. MEMBERS: Agreed.

4. Surplus for distribution to producers

The surplus in the 1959-60 oats pool for distribution to producers was as follows:

Surplus on operations of the board as at January 27, 1961.....	\$3,901,109	
Deduct: Prairie Farm Assistance Act Levy.....	\$ 38,912	
Cost of issuing final payment.....	27,835	
		66,747
		3,834,362
Add: Additional interest earned after January 27, 1961..		17,956
Surplus for final distribution to producers.....	\$3,852,318	

As shown by the preceding table the final surplus for distribution to producers was \$3,852,318. On producers' marketings of 23,660,976 bushels, the average final payment was 16.281 cents per bushel.

The following table shows initial payments, final payments and prices realized by producers (basis in store Fort William/Port Arthur) for the principal grades of oats delivered to the board in 1959-60 after deducting board operating costs, including carrying charges in country and terminal elevators and board administrative expenses:

	Initial Payment ¹	Final Payment ¹	Realized Price ¹
	(cents per bushel)		
No. 2 Canada Western.....	60	17.319	77.319
No. 3 Canada Western.....	57	16.077	73.077
Extra No. 1 Feed.....	57	15.440	72.440
No. 1 Feed.....	55	16.207	71.207
No. 2 Feed.....	50	19.648	69.648
No. 3 Feed.....	45	21.068	66.068

¹ Prior to deduction of Prairie Farm Assistance Act levy.

The final payment on the 1959-60 oats pool was approved by Order in Council P.C. 1961-194, February 13, 1961. The issuance of the final payment cheques to producers commenced on February 15, 1961 and was completed on February 21, 1961.

Mr. EARL:

5. Purchases and sales

The following table shows board purchases and net sales of oats, by months, and stocks of oats held by the board at the end of each month for the account of the 1959-60 pool:

	Purchases	Sales	Unsold Stocks
	(bushels)		
August, 1959.....	859,070	—	859,070
September.....	3,462,298	—	4,321,368
October.....	1,996,460	3,171	6,314,657
November.....	1,629,816	130,307	7,814,166
December.....	1,218,129	225,402	8,806,893
January, 1960.....	822,358	218,134	9,411,117
February.....	814,799	204,754	10,021,162
March.....	6,042,567 ¹	4,617,400 ¹	11,446,329
April.....	947,595	1,047,728	11,346,196
May.....	2,076,811	3,797,687	9,625,320
June.....	2,364,797	2,386,188	9,603,929
July.....	6,777,731	2,135,300	14,246,360
August.....	—	6,438,393	7,807,967
September.....	—	3,221,888	4,586,079
October.....	—	2,918,551	1,667,528
November.....	—	710,528	957,000
December.....	—	957,000	—
	29,012,431	29,012,431	

¹ Includes 5,311,436 bushels purchased from the 1958-59 pool account and the sale of 4,169,000 bushels of futures to 1958-59 pool account.

During the period from August 1, 1959 to March 4, 1960, sales of oats were mainly for the account of the 1958-59 pool account. Small sales were credited to the 1959-60 pool account, these sales consisting of grades which could not be supplied from the inventory of the 1958-59 pool.

Sales of oats were moderate during the April-June period, reflecting lack of export and domestic demand. About mid-July a sudden increase in domestic demand occurred. During the balance of the selling period of the 1959-60 Pool, sales were effected as rapidly as supplies could be placed in forward positions. In addition, sales were also made from the 1960-61 Pool Account during November and December, 1961.

The CHAIRMAN: Are there any questions on this section?

Mr. HORNER (*Acadia*): I have one question. You speak of increased demand about the middle of July. I note also that the price rose at the same time. Did it rise because of the increased demand?

Mr. McNAMARA: Yes.

The CHAIRMAN: Shall we take No. 6—Pricing, as read?

Some Hon. MEMBERS: Agreed.

6. Pricing

The following table shows monthly average board asking prices for No. 1 feed oats, along with high and low prices recorded each month during the selling period of the 1959-60 Pool Account; i.e. from March 7, 1960 to January 27, 1961. Prices are basis in store Fort William/Port Arthur.

	High	Low	Average
	(cents per bushel)		
March, 1960.....	77½	73½	75½
April.....	77	75½	76½
May.....	78½	76½	77½
June.....	79½	76½	78
July.....	81½	76	78½
August.....	85½	81	83
September.....	82	80½	81½
October.....	80½	77	79½
November.....	77½	70½	72½
December.....	71½	70½	71
January, 1961.....	71½	71	71½

During the March-June period, Board asking prices for No. 1 feed oats moved to slightly higher levels. In the months of July and August asking prices increased sharply, reflecting an upsurge in domestic demand and advancing prices on the futures market. While oats continued to move in volume during the first half of the crop year 1960-61, prices worked to lower levels, reaching their low point in the final weeks of the selling period of the 1959-60 pool account.

Mr. EARL:

7. General Comment

Marketing operations during the selling period of the 1959-60 Oats Pool were characterized by two distinct phases. The first phase comprised the March-June period when demand was limited. Stocks of oats, placed in eastern positions prior to the close of navigation in 1959, were only partially absorbed during the ensuing winter months and these stocks provided for part of eastern demand into the month of May and, some instances, into June. In the absence of sizeable export demand, trading in oats during the foregoing period was of a limited nature. During this period, stocks of oats were available at all times to meet market demand.

The second phase arose in July and continued to the close of navigation on the Great Lakes. This latter phase had its origin in a sudden demand for oats which arose in mid-July and continued for the balance of the period. The immediate incentive to the market was provided by a sharp decline in oats production in Ontario and the lack of forward commitments on the part of buyers at the time.

Under the circumstances a substantial movement of western oats was required from country stations to the Lakehead and into eastern positions during the August-December period. This movement was carried out under difficult conditions because of prior commitments on the part of the Board in respect to Durum Wheat and other grades of wheat required to meet sales contracts. Elevator congestion at the Lakehead and in eastern positions, including St. Lawrence ports, added to the difficulty of placing western oats in the eastern market in adequate volume for immediate and later requirements. However, by the close of navigation the quantities of oats purchased for eastern winter requirements had been moved forward.

When it became apparent that substantial, if not completely adequate, quantities of oats would be available for the domestic market, prices declined steadily from the levels reached in mid-August. For the month of August the average Board asking price for No. 1 Feed Oats was 83 cents per bushel. In September and October monthly average Board asking prices declined to 81 $\frac{3}{4}$ cents and 79 $\frac{1}{2}$ cents, respectively. Prices dropped sharply in the final three months of the selling period.

Exports of oats were very limited during the selling period of the 1959-60 Pool, amounting to slightly over 3 million bushels. Small export shipments were made to the United Kingdom, Germany, Switzerland and the United States.

Producers' deliveries to the 1959-60 Oats Pool amounted to 23.7 million bushels. These supplies were delivered by producers under initial and general delivery quotas established between August 1, 1959 and July 31, 1960. These deliveries, along with stocks of oats in commercial positions on August 1, 1959, were adequate to meet domestic and export demand for the crop year 1959-60. The sudden demand for oats in July, 1960, and subsequent shipping policies carried out by the Board had the effect of enlarging producers' deliveries of oats to the ensuing Pool.

The average final payment to producers from the 1959-60 Oats Pool was 16.281 cents per bushel as compared with an average final payment of 8.138 cents per bushel in the case of the 1958-59 Pool Account. The increased return to producers was due, firstly, to a higher level of realized prices for the greater part of the selling period of the 1959-60 Pool and, secondly, to decreased carrying charges.

Of total sales of 28,980,710 bushels, 21,563,000 bushels were sold in the futures market.

Mr. MILLIGAN: Under the Wheat Board Act, the wheat board have complete control over the importation of oats, barley and coarse grain into this country?

Mr. McNAMARA: We have the power to authorize the importation or exportation of wheat, oats and barley.

Mr. MILLIGAN: Under this set-up, the western producer has the highest form of protection that can be given against the importation of coarse grains?

Mr. McNAMARA: That is a difficult question for me to answer. I think I can best answer it by giving my first answer; we have the power to authorize the importation or exportation of wheat, oats and barley.

Mr. MILLIGAN: As long as there is a surplus of wheat in western Canada, it is impossible to import a carload of grain into the country?

Mr. McNAMARA: There has been a heavy importation of corn, as I pointed out already.

Mr. MILLIGAN: I am thinking of coarse grains.

Mr. McNAMARA: In connection with the importation of coarse grains, I gave you comparative prices and tried to indicate by those prices the quantity of American grain imported into eastern Canada would be higher with the prices you have been paying for western oats. I do not think it is an argument to say, in fact, we have not authorized the importation of American feed grain, oats and barley into eastern Canada.

Mr. MILLIGAN: Of course the price structure would be different to the Argentine?

Mr. McNAMARA: I doubt it very much.

Mr. MUIR (*Lisgar*): The price structure here would be different from the Argentine.

Mr. McNAMARA: I doubt it very much. We will check that but I do not think we can import Argentine oats to Montreal as cheaply as western oats. In the absence of actual trading, it is difficult to calculate the cost of delivering Argentine oats in store Montreal. However on the basis of an estimated freight cost and nominal quotations in the Argentine the cost would be in the neighborhood of \$50.00 per metric ton in cargo lots. Stocks of surplus oats in the Argentine are very small.

Mr. HORNER (*Acadia*): Mr. McNamara more or less answered my question. I was going to point out to Mr. Milligan that any importation of oats or barley would cost more.

Mr. HENDERSON: Oats from the United States are not as good as Canadian oats.

Mr. McNAMARA: I agree.

THE CHAIRMAN: I hope the committee might consider adjourning, once we finish the oats account here. Before doing so, I believe we have figures and tables presented to us. Would it be agreeable to the committee that these be made appendices to today's proceedings?

Agreed.

Any further question or general comment?

Mr. HORNER: (*Acadia*): Will you table all that was handed to us tonight?

THE CHAIRMAN: There are two sets of figures which will be tabled.

EVIDENCE

TUESDAY, JUNE 27, 1961

The CHAIRMAN: Gentlemen, we have a quorum.

Before we proceed this morning, I would like to introduce some of the gentlemen at the back and, if there are any persons I miss, I would ask them to stand up and identify themselves, and advise us which pool or elevator company they are with.

I would like to introduce Mr. Cecil Lamont, president of the Northwest Line Elevators, along with Mr. McIchan, who is also with Northwest Lines Elevators. Then, there is Mr. G. L. Harrold, president of the Alberta wheat pool; Mr. H. L. Griffin, an economist with the United Grain Growers; Mr. R. C. Brown, vice-president of the United Grain Growers; Mr. Charles W. Gibbings, president of the Saskatchewan wheat pool, and Dr. W. J. Parker, who was here yesterday, and is expected back this morning. We appreciate having you gentlemen in attendance.

At adjournment last evening we had finished up the pool account in connection with oats, and I understand it was the decision of the committee to proceed to the next item, namely the barley pool account.

Mr. EARL:

1959-60 Pool Account—Barley

1. Receipts and Disposition

RECEIPTS

Receipts of barley in the 1959-60 Pool were 109,175,791 bushels.* This total included 94,903,083 bushels delivered by producers between August 1, 1959 and July 31, 1960; and an additional 1,370 bushels received from others than producers and 14,271,338 bushels transferred from the 1958-59 Pool as at March 4, 1960.

DISPOSITION OF STOCKS

Sales of barley from the 1959-60 Pool Account and weight losses in drying amounted to 90,457,370 bushels and 197,025 bushels respectively, leaving 18,521,396 bushels of unsold stock to be transferred to the 1960-61 Pool Account in accordance with the provisions of Section 29 of the Canadian Wheat Board Act. These latter stocks consisted principally of No. 1 Feed and No. 2 Feed Barley. Of the total transfer, 16,268,000 bushels were covered by sales of futures. Stocks of cash barley were transferred as at the close of business on March 30, 1961 on the basis of the Board's quoted prices for the grades concerned, less $3\frac{1}{2}$ cents per bushel for subsequent carrying charges. Futures were transferred on the basis of market closing quotations for the relevant futures on March 30, 1961. The transfer was approved by Order in Council P.C. 1961-562, April 20, 1961.

*Pool receipts were revised downward by 177 bushels as compared with receipts shown on Page 23 of the Annual Report of The Canadian Wheat Board for 1959-60.

The CHAIRMAN: Are there any questions?

Mr. HORNER (*Acadia*): I have one question which is in connection with barley, particularly. I would like to know how it applies to the cash advances. I have asked this before, but I still am not clear on it. If a person takes out a cash advance, say on his wheat, and if he had a carload of malting barley go malting and he has an opportunity to ship a carload of malting barley, is this cash advance collected on that, as well?

Mr. McNAMARA: Just a minute, now; there is a little difference of opinion here. Over-quota barley is except from the payment of a cash advance. The first year it was included. However, it was amended, and now if a farmer has a cash advance and gets a special permit to deliver a carlot over the quota, the cash advance is not deducted from the settlement of the over-quota barley; it is only on the general quota.

Mr. MUIR (*Lisgar*): When he takes a cash advance, he has to say how many bushels he has at home and, if this barley is at home, is the cash advance not made on the barley as well?

Mr. McNAMARA: It is deliverable up to the six bushels of the regularly specified quota. He has to say he has grain on the farm to protect the six bushels.

Mr. ROGERS: To pursue that further, when he sells this carload of malting barley, he does not have to pay the advance when it is taken out on the six-bushel quota.

Mr. McNAMARA: Not out of the proceeds of that malting barley; under the general quota he pays his advance, but it is not deducted from the settlement of the over-quota grain.

Mr. MANDZIUK: Do you check to see if he has any grain over and above?

Mr. McNAMARA: Excuse me. My advisers tell me I am all wrong, again. Could we come back to this after these boys have had their huddle? I still think I am right.

Mr. HORNER (*Acadia*): I hope you are.

Mr. MANDZIUK: I do not think you should be right.

Mr. ROGERS: I do not think so, either.

The CHAIRMAN: Is it agreed that we proceed to No. 2?

Some HON. MEMBERS: Agreed.

The CHAIRMAN: Can we take No. 2 as read?

Some HON. MEMBERS: Agreed.

2. 1959-60 Pool Account—Barley

The following table shows the operating results of the 1959-60 Pool Account from August 1, 1959 to the closing date of the Pool, March 30, 1961:

	Bushels
1. Barley acquired by the Board:	
(a) Producers' deliveries, August 1, 1959 to July 31, 1960	94,903,083
(b) Barley otherwise acquired ¹	1,370
(c) Purchased from 1958-59 Pool Account —Barley	14,271,338
Total barley acquired	<u>109,175,791</u>

	(Value)	(Value)
2. Cost of barley acquired		\$ 97,463,064
3. Proceeds of sales—August 1, 1959 to March 30, 1961	\$89,453,647	
Transferred to 1960-61 Pool Account as at March 30, 1961 ²	16,832,290	106,285,937
4. Gross surplus as at March 30, 1961		8,822,873
5. Operating costs—August 1, 1959 to March 30, 1961:		
(a) Carrying charges, including terminal storage	6,508,078	
(b) Interest and bank charges	241,414	
(c) Freight recovery on export barley ...	(831,822)	
(d) Diversion charges on export barley .	135,812	
(e) Drying charges	235,398	
(f) Brokerage and Clearing Association charges	12,355	
(g) Administrative and general expenses	439,553	6,740,788
6. Surplus on operations of the Board on 1959-60 Pool Account—Barley, for the period August 1, 1959 to March 30, 1961		\$ 2,082,085

¹ Purchases from non-producers at the Board's initial prices basis in store Fort William/Port Arthur.

² For details of transfer see above.

The CHAIRMAN: If there are no questions, we will proceed to No. 3, Operating Costs.

Mr. EARL:

3. Operating Costs

Net operating costs applicable to the 1959-60 Barley Pool were \$6,740,788. The principal item in operating costs was carrying charges amounting to \$6,508,078, or 6.8576 cents per bushel on producers' deliveries to the Pool. Net interest and bank charges were \$241,414. Diversion charges on barley shipped to the Pacific Coast for export were \$135,812. Freight recoveries on West Coast export shipments amounted to \$831,822. Drying charges amounted to \$235,398. Brokerage and Clearing Association charges applicable to the Pool were \$12,355. Administrative and general expenses amounted to \$439,553 or .4632 cent per bushel on producers' deliveries of 94,903,083 bushels.

Mr. MUIR (*Lisgar*): What are the freight recoveries?

Mr. McNAMARA: We buy the barley basis in store Fort William-Port Arthur. In the case of wheat, the initial payment is based at Vancouver, Fort William and Port Arthur. However, oats and barley, are bought basis in store, Fort William. Therefore, on the barley we ship to the west coast, we pick up the freight differential. It is bought basis, Fort William. There is a saving in freight which we pick up from the elevator companies, and this goes into this account.

Mr. KORCHINSKI: What is the rate of interest charged?

Mr. McNAMARA: We do not charge the interest. The companies, under the handling agreement, borrow from the banks, and we pay the interest. At the present time the board is paying on our direct borrowings an interest of 5 per cent. It was reduced from 5½ per cent to 5 per cent, and the country elevator companies, as agents of the board, are borrowing at the rate of 5½ per cent.

Mr. KORCHINSKI: Who absorbs the other ½ per cent?

Mr. McNAMARA: We pay the 5½ per cent in the carrying charge rate; however, on our direct borrowings from the bank, we only pay them 5 per cent—that is, from June 1st.

Mr. HORNER (*Acadia*): In connection with these west coast shipments and the buying of barley at Fort William prices, say the barley was bought at Vancouver or Pacific coast prices; then, the farmers living in that area where the freight haul would be the shortest, would get a little more for their barley in their initial payments.

Mr. McNAMARA: In the case of barley that can be sold for shipment out of the west coast, yes. However, all the barley is not in that position, and barley that moves east has to be sold at the Fort William price.

This is a question which has been discussed particularly by the Alberta growers over the last number of years. In some years it is possible to ship and sell substantial quantities of barley out of the west coast; however, in other years, the bulk of the barley has to move against a differential. A similar situation applies at Churchill. In certain areas we can ship there at a reduced rate, and some of the people in the Churchill area figure they should get all their wheat bought basis Churchill differential. Unfortunately, the volume of business originating out of Churchill and out of the west coast this year is lower. I think our shipments have been only about 19 million bushels so far this crop year. There is a relatively small proportion that is bought in Alberta.

Mr. SOUTHAM: Under "Operating Costs" I notice you have a figure of \$235,398 for drying charges. That seems to be a relatively small charge in spite of its being a damp year in 1959-60.

Mr. McNAMARA: This only applies to the barley. There are the drying charges on wheat and oats, in addition.

Mr. SOUTHAM: How many bushels of barley would that represent?

Mr. McNAMARA: I think we could probably give you a figure of the quantity of barley that was dried.

Mr. EARL: In the 1959-60 pool account the total quantity of barley dried was 4,408,148 bushels.

Mr. SOUTHAM: In a normal year you would not have too much of an expense in this connection.

Mr. McNAMARA: No; normally, we do not have too much barley or wheat to dry. Last year was an abnormal year for all grains, as far as drying was concerned.

Mr. SOUTHAM: Approximately how much per bushel did it cost?

Mr. McNAMARA: Basis wheat, if I recollect correctly, there was an initial payment spread of 15 cents a bushel. On damp, not tough, it was 15 cents a bushel. The average drying charge worked out to 7 cents. It was not all artificially dried. In connection with tough, the discount between straight grade and tough worked out to 4 cents a bushel. We absorb some of it for what we call pencil drying. We absorb some of it for what we call pencil drying. But when damp barley comes to the dryer we take a shrinkage loss into consideration, and it comes to 15 cents a bushel or slightly less than that.

Mr. SOUTHAM: It is a pretty expensive process when you have to deal with it like that.

Mr. McNAMARA: Oh yes.

Mr. MANDZIUK: In the case of your dried grain, whichever it is, barley or wheat, do you make a profit on it?

Mr. McNAMARA: No.

Mr. SOUTHAM: You buy from the farmer at a certain grade for damp or tough?

Mr. McNAMARA: That is right.

Mr. SOUTHAM: And does your grade improve with drying?

Mr. McNAMARA: In the case of damp wheat, we buy it at a 16 cent discount under the straight grade price. In the actual drying calculation, we calculate a shrinkage loss, and it goes out at about 15 cents a bushel less; so we reflect the difference in the final payment to the producer. The producer who delivers tough or damp grain, gets a payment which represents the actual cost to the pool of conditioning that tough or damp grain.

Mr. SOUTHAM: I repeat my question; does the grain improve after drying?

Mr. McNAMARA: When you take the moisture out of it—let us say you have damp No. 3 northern; with careful drying it will become straight No. 3 northern, and may be sold as straight No. 3 northern after drying.

Mr. MUIR (*Lisgar*): Do you get a premium on early season barley?

Mr. McNAMARA: We get a premium on barley selected by the maltsters, be they Canadian or American maltsters and usually they buy at this time in the year. The heavy interest at the present time is in barley for malting purposes, because the quality of our new crop is very much in doubt. So therefore the maltsters are trying to buy up all the old crop that is available.

Mr. MUIR (*Lisgar*): Do you find there is a demand in the early market for barley in the early harvest season?

Mr. McNAMARA: They come in and cover themselves for early shipment. We normally sell substantial quantities of malting barley in August and September.

Mr. KORCHINSKI: Where do we export the malting barley?

Mr. McNAMARA: The export market is primarily the United States; that is our largest malting barley market.

Mr. KORCHINSKI: What amount do we export to the United States?

Mr. McNAMARA: Last year we exported about 9 million bushels to the United States. This year we are running from 7 million to 8 million, and I think it will be about 9 million or 10 million bushels.

Mr. KORCHINSKI: What do we normally use up in Canada?

Mr. McNAMARA: We use up in Canada between 15 million to 16 million bushels.

Mr. KORCHINSKI: Are there any other countries to which we sell substantial quantities of malting barley?

Mr. McNAMARA: Not for malting purposes; there is a limited market for barley for distilling purposes in the United Kingdom, but it is a small market.

Mr. MUIR (*Lisgar*): Do you still get the bulk of your malting barley from Manitoba?

Mr. McNAMARA: No; it is pretty well divided among the three provinces; I am thinking of northern Saskatchewan at the moment, and even Alberta grows some malting barley.

Mr. GUNDLOCK: I want to go back to wheat, if I may.

The CHAIRMAN: Will you please hold your questions until we come to the wheat account?

Mr. McNAMARA: I am advised that I was wrong in my answer. The only exemption was the exemption on seed grain. The deduction is on malting barley.

Mr. HORNER (*Acadia*): Even if it is over the quota?

Mr. McNAMARA: Yes, that is right.

Mr. MANDZIUK: Your advisers are right.

Mr. McNAMARA: I admit defeat.

Mr. HORNER (*Acadia*): I do not give up that easy.

Mr. McNAMARA: I think we had better amend the act.

Mr. HORNER (*Acadia*): I wonder if there is not some merit to it. A number of farmers have complained to me that once they have taken out a cash advance on their wheat, then because they have some malting barley—this farmer had something like 20,000 bushels of wheat at home in his granary, but he delivered a carload of malting barley over and above the quota, and the elevator agent wanted to take it off the cash advance he had received. He had no reason to do it, because he said he had oodles of wheat at home to cover it. I wonder if there is not some merit to his claim.

Mr. MANDZIUK: They would have to screen every borrower.

Mr. HORNER (*Acadia*): You take your cash advance according to what grain you take it out upon. It is 50 cents on wheat, and 30 cents on oats, and so on; and if you take it out on wheat, I do not see why on an over-quota shipment of malting barley a deduction should be made on that. Now, I want to ask another question, if there is no further answer to my first question. May a person in a position like that—let us say, a person who has wheat at home to cover a \$3000 cash advance, and he ships a carload of malting barley, and they make a deduction from that which would not cover the \$3000, but practically eat into it quite a ways—could he then renew his cash advance?

Mr. McNAMARA: I would like our solicitor to deal with that question.

Mr. H. R. MONK, Q.C. (*Solicitor, Canadian Wheat Board*): A short answer is no, we cannot.

Mr. HORNER (*Acadia*): That is the very point.

Mr. MONK: They are deducted from the amount which he is eligible to receive, that is, monies that he has received from grain already delivered; so if he has already delivered malting barley, the other sections of the statute provide that they will deduct the amount he has received, so there will be nothing left which we could advance him.

Mr. HORNER (*Acadia*): I am afraid that I do not follow you. Perhaps I am more than usually stupid this morning.

Mr. MONK: The limit that a person may receive as a cash advance is \$3000 less what he has already delivered, that is, less the grain he has already delivered. The principle of the statute is to allow some money to people who are not able to deliver grain. If he has delivered grain, other than under his unit quota, the amount that he receives for the grain is deducted from the amount he is then eligible to borrow, or to get under the cash advance. So if he has already received money, that money is taken from, or deducted from the limit he could receive later as cash advance. The practical effect is that if he has once delivered a carload of malting barley, he probably is not eligible for a cash advance.

Mr. HORNER (*Acadia*): That is the very point I am trying to establish. I point out to the committee that this might stand looking into. In other words, a farmer may obtain, provided he has the grain, a \$3000 cash advance, but when that is used up, through sales of wheat, he cannot in any way obtain another cash advance, whether or not he has grain in storage.

Mr. McNAMARA: That is right. Section 7 subsection 2 of the "Prairie Grain Advance Payments Act" reads as follows:

(2) The quantity of grain in respect of which an advance payment may be made to a producer shall not exceed the quantity that would be deliverable under the applicant's current permit book on a quota of six bushels per specified acre minus the quantity of grain delivered to the board under general acreage quotas by the applicant prior to his application and during the crop year in which the application is made.

If he delivers under the quota, that amount will be deducted from the amount he will later receive.

Mr. HORNER (*Acadia*): If a farmer has delivered, let us say, 6000 bushels of wheat, and then applies for a cash advance, he could not have it?

Mr. McNAMARA: No, that is right.

Mr. ROGERS: To come back to this original query of Mr. Horner's, I think that if a man takes out an advance on wheat and then subsequently sells a carload of malting barley there is no reason why that advance should be taken out of that barley. I really think there is some merit in this. On the other hand, if he took out an advance on barley and then he sells a carload of malting barley, there is some sense to that.

Mr. KORCHINSKI: Would there not be a little difficulty here. In taking out your cash advance you state that you have a certain amount of grain. You do not know whether or not that barley will go malting. You would normally say that you have it for sale and then some time after obtaining the cash advance you might find that it will go malting. I do not see how this money can be recoverable if you do not do this.

Mr. ROGERS: You miss the whole point of this.

Mr. KORCHINSKI: No.

Mr. HORNER (*Acadia*): He is taking an advance on his wheat.

Mr. ROGERS: And then subsequently he sells a carload of malting barley. There is no reason why the advance should be paid out of the malting barley. He still has the wheat.

Mr. NASSERDEN: You are trying to raise the \$3,000 limit.

Mr. HORNER (*Acadia*): No; we are trying to encourage diversification. A farmer can go ahead and grow his wheat to cover his acreage; but if he grows malting barley and gets an over-quota permit to sell it, this should be a cash crop the same as flax or any other thing. He is growing this and has paid particular attention to the way he has harvested his crop, so that it would go malting. He should be able to receive the money from it rather than have it eaten into by what he has borrowed on his 6,000 bushels of wheat. It is in the fall of the year that there is most of the demand for barley. He has paid particular attention to the way he has harvested it and he wants to get some cash in the fall, so he goes and takes the advance on the 6,000 bushels of wheat and after he has done this he has an opportunity to sell a carload of barley. This does not bring him in any further cash; it just cuts into the cash he has already received. I think that a carload of barley sold over and above quota should not interfere with the advance the farmer has taken out on wheat.

The CHAIRMAN: Does this not come under the regulations in respect of cash advances to western farmers? I do not think it is up to the wheat board to amend those regulations; it is up to the government to amend the regulations.

Mr. HORNER (*Acadia*): I have one further question on this point. Am I right that on wheat a farmer borrows an amount up to fifty cents a bushel on his stored wheat?

Mr. MONK: Yes. He indicates on the form what he has in store and the advance is made in respect of that; but he undertakes to deliver the grain as soon as he can. The deduction is made from all the grain he delivers until it is paid.

Mr. HORNER (*Acadia*): What can he borrow on oats and barley.

Mr. MONK: The maximum is set out in the statute.

Mr. HORNER (*Acadia*): I want it clearly put into the record.

Mr. MONK: It is in the statute. He gets fifty cents a bushel on wheat, twenty-five cents a bushel on oats and thirty-five cents a bushel in the case of barley. This is repaid by deduction of one-half the initial payment on any grain he delivers after that until it is repaid.

Mr. HORNER (*Acadia*): This is the point I want to establish. When a farmer takes out a cash advance he signifies what he is taking it out on.

Mr. MONK: He signifies what he has in store on his farm.

Mr. HORNER (*Acadia*): If he has wheat, he is allowed fifty cents a bushel cash advance.

Mr. MONK: This question was under consideration when the statute was drawn. I think the decision was that it should be deducted from all grain, because it would put the elevator agent in a very difficult position if he had to select which grain it would be deducted from.

Mr. HORNER (*Acadia*): But when a farmer takes a cash advance, does he not signify what grain he has in storage.

Mr. MONK: Yes; he shows what he has on the farm.

Mr. HORNER (*Acadia*): If he has 6000 bushels of wheat in storage, he can take a \$3000 cash advance from the elevator company?

Mr. MONK: Provided he could deliver that under the six bushel quota.

Mr. HORNER (*Acadia*): Yes; but if he then sells an overquota load of barley it is a pure cash crop. That is probably the reason why he has taken this land out of wheat.

Mr. MONK: The statute requires that it be deducted.

Mr. MANDZIUK: I see merit in his cash payment being deducted out of the proceeds of the carload of malting barley, but I see no merit in refusing a farmer another cash advance if he has 6000 bushels, or whatever amount, of wheat on his premises.

Mr. McNAMARA: I think that as the chairman pointed out this is not wheat board legislation. We only act as administrators.

Mr. MANDZIUK: But you make the regulations.

Mr. McNAMARA: No. This is outside of our jurisdiction. We only act for the crown on this.

The CHAIRMAN: I think it has been pointed out that you want these regulations changed. I would then suggest that you proceed through the proper authorities to have the regulations changed.

Mr. HORNER (*Acadia*): Would the same situation of which I have spoken this morning in respect of malting barley also apply in the sale of flax, for instance?

Mr. McNAMARA: No; flax is not included in the statute.

Mr. HORNER (*Acadia*): Or rapeseed or other things?

Mr. McNAMARA: No.

The CHAIRMAN: As item No. 4, surplus for distribution to producers, is a table, shall we take it as read?

Agreed.

3. Operating Costs

Net operating costs applicable to the 1959-60 barley pool were \$6,740,788. The principal item in operating costs was carrying charges amounting to \$6,508,078, or 6.8576 cents per bushel on producers' deliveries to the pool. Net interest and bank charges were \$241,414. Diversion charges on barley shipped to the Pacific coast for export were \$135,812. Freight recoveries on west coast export shipments amounted to \$831,822. Drying charges amounted to \$235,398. Brokerage and clearing association charges applicable to the pool were \$12,355. Administrative and general expenses amounted to \$439,553 or .4632 cent per bushel on producers' deliveries of 94,903,083 bushels.

4. Surplus for Distribution to Producers

The surplus in the 1959-60 barley pool for distribution to producers was as follows:

Surplus on operations of the board as at March 30, 1961 ..	\$2,082,085
Deduct: Prairie Farm Assistance Act levy ..	\$20,426
Cost of issuing final payment	<u>49,072</u>
	69,498
	<u>2,012,587</u>
Add: Additional interest earned after	
March 30, 1961	<u>9,584</u>
Surplus for final distribution to producers	<u>\$2,022,171</u>

As shown by the preceding table the final surplus for distribution to producers was \$2,022,171. On producers' marketings of 94,903,083 bushels, the average final payment was 2.131 cents per bushel.

The following table shows initial payments, final payments and prices realized by producers (basis in store Fort William/Port Arthur) for the principal grades of barley delivered to the board in 1959-60 after deducting board operating costs, including carrying charges in country and terminal elevators and board administrative expenses:

	Initial Payment ¹	Final Payment ¹	Realized Price ¹
	(cents per bushel)		
No. 2 C.W. Six-Row.....	98	2.195	100.195
No. 3 C.W. Six-Row.....	96	2.195	98.195
No. 4 C.W. Six-Row.....	88	1.195	89.195
No. 2 C.W. Two-Row.....	91	7.195	98.195
No. 3 C.W. Two-Row.....	88	3.695	91.695

No. 3 Feed.....	76	8.220	84.220
Tough No. 3 C.W. Six-Row.....	92	2.195	94.195
Tough No. 3 C.W. Two-Row.....	84	3.695	87.695
Tough No. 1 Feed.....	83	1.194	84.194
Tough No. 2 Feed.....	79	4.000	83.000
Tough No. 3 Feed.....	72	8.220	80.220

¹Prior to deduction of Prairie Farm Assistance Act levy.

The final payment on the 1959-60 barley pool was approved by order in council P.C. 1961-563, April 20, 1961. The issuance of the final payment cheques to producers commenced on April 20, 1961 and was completed on April 28, 1961.

Mr. ROGERS: I see the item here cost of issuing final payment \$49,072. How is that made up?

Mr. EARL: That includes all the costs incidental to the payment, such as the cost of the cheques, postage, and the services of the people engaged in that particular operation.

Mr. MANDZIUK: Are they not permanent employees?

Mr. EARL: Yes; but their services are split between the various operations they perform, and we cost it in that way.

The CHAIRMAN: No. 5, purchases and sales.

Mr. EARL:

5. Purchases and Sales

The following table shows board purchases and net sales of barley, by months, and stocks of barley held by the board at the end of each month for the account of the 1959-60 pool:

	Purchases	Sales	Unsold Stocks
		(bushels)	
August, 1959.....	1,091,141	20,018,689	(18,927,548)
September.....	6,403,184	626,613	(13,150,977)
October.....	9,862,869	3,831,630	(7,119,738)
November.....	9,485,726	1,020,469	1,345,519
December.....	8,952,951	79,265	10,219,205
January, 1960.....	5,542,020	36,386	15,724,839
February.....	4,723,024	38,529	20,409,334
March.....	17,890,662 ¹	12,554,563 ¹	25,745,433
April.....	4,535,613	3,349,595	26,931,451
May.....	8,096,552	9,951,638	25,076,365
June.....	9,803,450	179,962	34,699,853
July.....	22,786,511	8,333,080	49,153,284
August.....	—	6,972,447	42,180,837
September.....	—	9,361,333	32,819,504
October.....	—	809,573	32,009,931
November.....	—	1,540,076	30,469,855
December.....	—	3,743,204	26,726,651
January, 1961.....	—	15,846,363	10,880,288
February.....	—	7,338,163	3,542,125
March.....	—	3,542,125 ²	—
	109,173,703	109,173,703	

¹Includes 14,271,338 bushels of cash grain purchased from the 1958-59 pool account and the sale of 11,703,000 bushels of futures to the 1958-59 pool account.

²Includes 18,521,396 bushels of cash grain sold to 1960-61 pool account and the purchases of 16,268,000 bushels of futures from the 1960-61 pool account; the net sale being 2,253,396 bushels.

Prior to and during August, 1959, the board entered into sales contracts for 20.0 million bushels of malting grades of barley, the grades to be delivered to purchasers from selected carlots shipped from country stations in August and succeeding months. Further sales were made on the same basis at later dates during the crop year.

For the period from August 1, 1959 to March 4, 1960, sales of feeding grades of barley were for the account of the 1958-59 pool, apart from small sales of specific grades of barley which could not be supplied by the 1958-59 pool.

During the period from March 7, 1960 to March 30, 1961 the market for feeding grades of barley was supplied mainly from the 1959-60 pool account. Substantial sales of barley were made for the opening of navigation in 1960. Sales were relatively heavy from July through September in response to the increased demand experienced at that time, both for current consumption and for the provision of winter stocks of barley in eastern positions. The 1959-60 pool was closed as at the close of business on March 30, 1961.

Mr. KORCHINSKI: I have one question in respect of the allocation of box-cars for malting barley. Are we given preference in the shipment of malting barley over the spotting of cars at elevators?

Mr. McNAMARA: We do not actually allocate them; however, the producer submits a sample to his company which is handling it, and if it is accepted by the maltster or exporter, we issue a permit for the over-quota delivery. On the issuance of it, we authorize the railway company to supply a car for the delivery of a shipment of that barley. Normally, the movement of malting

barley is preferenced but, from time to time, we change our instructions to the trade regarding the preference. We might have Durum as first, and malting barley as second preference. In general, the procedure is to preference the movement of the malting barley.

Mr. KORCHINSKI: It depends upon your order of priority.

Mr. McNAMARA: Yes.

The CHAIRMAN: No. 6, Pricing, is next.

Mr. EARL:

6. Pricing

The following table shows monthly average quotations for No. 1 Feed Barley, together with high and low prices recorded each month from August 1, 1959 to March 30, 1961. All prices are basis in store Fort William/Port Arthur.

	High	Low	Average
	(cents per bushel)		
August, 1959.....	94½	91	93½
September.....	94½	93½	94
October.....	96½	93½	95½
November.....	97½	93½	95½
December.....	96½	92½	93
January, 1960.....	97½	95½	96½
February.....	97½	94	95½
March.....	96½	93	95½
April.....	97	95½	96½
May.....	100½	96½	98½
June.....	99½	95½	98½
July.....	97½	96	96½
August.....	99	97½	98½
September.....	102	98	99½
October.....	108	101½	104½
November.....	102½	93	95½
December.....	93½	92½	93
January, 1961.....	95	93	93½
February.....	96½	95½	95½
March.....	96½	93½	95½

Board asking prices for No. 1 Feed Barley fluctuated between a low of 91 cents per bushel in August, 1959, and a high of \$1.08 per bushel in October, 1960. From August, 1959 through July, 1960 asking prices fluctuated within narrow limits and showed a slight upward trend. The market was relatively strong during September-November, 1960, but worked to lower levels during the balance of the selling period of the 1959-60 Pool.

The CHAIRMAN: Are there any questions?

Mr. MUIR (*Lisgar*): How do you set your fluctuation with your price throughout the year? How do you arrive at that?

Mr. McNAMARA: As you know, in merchandising oats and barley, we use the Winnipeg futures market. We sell it basis in store Fort William and utilize the services of the futures market. So, on the fluctuation of that market, as well as the cash spreads, we set the premiums and discounts, and that is how we determine our asking price.

Mr. MUIR (*Lisgar*): Is that done with flax?

Mr. McNAMARA: We do not handle flax at all; just oats and barley, not wheat.

Mr. SOUTHAM: Would this market fluctuation be based on the fact that a certain amount of our barley stocks was under the snow, with the result that the increase in price would be related to that potential visible supply which was still under the snow?

Mr. McNAMARA: To a degree, and also the stocks available in Fort William at that time.

Mr. EARL:

7. General Comment

For the crop year 1959-60 exports of barley, excluding barley products, reached a total of 58 million bushels. However, with the crop year 1960-61 a sharp decline occurred in exports of barley to the United Kingdom and to other destinations. From August 1, 1960 to March 30, 1961 exports of barley to European destinations declined to 7.1 million bushels as compared with 25.2 million bushels during the corresponding period of the previous crop year. The decline was due to the availability of European supplies of barley at relatively low prices and alternative feedstuffs, particularly corn, being offered freely and cheaply. Lack of exports to Europe and the low prices prevailing in European markets had an adverse effect on the 1959-60 Pool Account during the final eight months of its selling period.

From the export standpoint, the sale of 12.1 million bushels in January, 1961 for delivery to the People's Republic of China was constructive.

Domestic demand for barley in the period from August 1, 1959 to March 30, 1961 was well maintained.

Of total sales of 108,978,766 bushels, 47,713,000 bushels were sold in the futures market.

The CHAIRMAN: Are there any questions?

Mr. PASCOE: Are the exports to the People's Republic of China going ahead on schedule?

Mr. McNAMARA: Yes. We have delivered all the barley under the first contract, and we are now delivering barley against a second contract.

Mr. PASCOE: How about the European situation this year?

Mr. McNAMARA: As the board, we are not optimistic about the European demand for feeding stuffs this year. You remember that last year, due to adverse weather conditions, the winter wheat crop in Europe was considerably reduced, and this spring a lot of this acreage was put into barley and feeding stuffs, rather than spring wheat. Coupled with the low quality of some of the wheat that is available, the heavy subsidies being paid by the Americans on the export of barley and oats, the very low price of American corn which is going into that market, the competition which is being met by the French, Russians and others, the feed grain market in Europe is pretty well demoralized. We are not at all optimistic about the demand for Canadian feed stuffs in Europe for the coming year.

Mr. PASCOE: So your contract with China was very helpful?

Mr. McNAMARA: Very, very helpful.

Mr. SOUTHAM: With respect to our local situation, the prospects are that if we have a short crop it possibly would keep the local farm market fairly strong for local grain.

Mr. McNAMARA: Yes. If the crop deterioration continues, we are not going to have any surplus feed in Canada.

Mr. SOUTHAM: Are the prospects that barley will strengthen in price this year?

Mr. McNAMARA: Well, to a degree, although the price of competitive feed stuffs, such as American corn imported into Canada, will have an offsetting influence in this regard.

Mr. HORNER (Acadia): How much corn was imported into Canada last year?

Mr. McNAMARA: I have not a final figure, but I think it was around 12 million bushels.

Mr. MUIR (*Lisgar*): What is the breakdown in your domestic sales of barley in connection with feed and malting?

Mr. McNAMARA: About 40 per cent of the barley that is taken into the pool is selected barley. It is just a little under that. In bushels, last year, I think we approved somewhere around 38 million on the over-quota basis.

Mr. MUIR (*Lisgar*): Where is the bulk of your domestic barley sold?

Mr. McNAMARA: Eastern Canada and the B.C. feeding market.

Mr. RAPP: Have we any No. 5 and No. 6—feed wheat, in storage now?

Mr. McNAMARA: No, we cleaned out the bins of any low-grade wheat. Even our No. 4 is getting in short supply.

Mr. SOUTHAM: In respect to the short crop prospect in western Canada due to our present climatic conditions, are you going to take a look at this situation and retain sufficient stocks in western Canada to meet the feed demands there?

Mr. McNAMARA: We have had situations like this in the past, and where the people in a community feel there is going to be a shortage of grain, and they would like to retain supplies of feeding grades or supplies for seeding purposes, the board will make arrangements with the elevator companies and the local municipality; and if the municipality will agree to pay the cost of carrying the grain until it is determined that it is needed, we will allow it to be held in these elevators. This will be an expense of the local administration, and it will be necessary for them to make arrangements with the particular company where they want the stocks held to pick up the carrying charges and pay for the cost of storing it until they determine whether they want to purchase it for local distribution. The minister or ourselves will be announcing a policy in this regard within the next day or so.

Mr. SOUTHAM: This policy does not indicate that the board is going to relax its efforts to sell export wheat.

Mr. McNAMARA: No. We still have a considerable volume of wheat, and will be pressing for sales of it.

Mr. BOULANGER (*Interpretation*): Yesterday, Mr. McNamara, you produced a list—and the date is the 18th of November, 1960—in respect of oats, wheat and barley laid down in Toronto, Montreal and other points. Is there any particular reason why you chose the 18th of November?

Mr. McNAMARA: Yes; that was the high of the market. That was a period in which the board's asking prices were at its highest level. In fairness to the committee, we thought we should give an estimate of the laid down cost on the basis of the highest market that prevailed last fall, as well as the current situation.

Mr. BOULANGER: In October, a month before, was that price not higher than in November?

Mr. McNAMARA: The November 18th date was calculated, on the basis of the price in effect on the close of navigation, when the highest freight charges prevailed—when the heavy movement from the Lakehead is going into eastern positions for the winter supplies.

Mr. BOULANGER: Would it be possible to give figures to the committee for September and October?

Mr. McNAMARA: Yes. Our prices are published daily, and for each day of the year. However, these charges will be relatively the same, except that the cost in November, toward the close of navigation, is slightly higher than in October. Freight rates go up towards the close of navigation.

Mr. BOULANGER: It would be interesting for the committee to have the prices for September and October in the record.

Mr. McNAMARA: We would be pleased to file for a year or for any period the board's selling price in store the Lakehead for these grades. We have them for every day of the year, and we can make available any period you wish. Would you like it for the whole year?

Mr. BOULANGER: Say, the middle of September and the middle of October.

The CHAIRMAN: Is it agreed that the tables be produced for 15th of September and the 15th of October?

Some Hon. MEMBERS: Agreed to.

The CHAIRMAN: If there are no further questions, that completes the operations of the barley account.

Mr. EARL: Mr. Boulanger, the figures which you requested are:

	Sept. 15, 1960	Oct. 14, 1960
No. 5 Wheat	\$1.47	\$1.49 $\frac{3}{4}$
No. 1 Feed Oats81 $\frac{1}{4}$.80 $\frac{1}{4}$
No. 1 Feed Barley99	1.08

Mr. BOULANGER (*Interpretation*): I would like to bring up once again the importance related to the price of grain. There have been briefs submitted by the farmers of the Saguenay area—the co-operative union of the Saguenay and the U.C.C. of the Saguenay, and they complain that they are paying more for feed grain in the Lac Saint-Jean area than in Montreal, because of the subsidies. They would like to acquaint the board with the fact that they feel they are under undue discrimination.

Mr. McNAMARA: Do I understand you are referring to the freight assistance?

Mr. BOULANGER: Yes.

Mr. McNAMARA: Of course, this is not administered by the board.

Mr. BOULANGER: I know it is not under the wheat board, but I wanted to tell the committee what is going on. They are paying 36 cents per 100 pounds more than the farmers from Quebec are paying, and I think there is discrimination. They built a large storage house a few years ago, and they told me last year they imported 9,000 hogs from the Quebec district, as they did not have enough hogs to supply the demand in this area.

Mr. HORNER (*Acadia*): What district?

Mr. BOULANGER: The Lac Saint-Jean Saguenay district.

The CHAIRMAN: Well, we have your comments on the record.

We now will turn back to page one in the supplementary report—the pool account, wheat. Before we proceed with that, Mr. Earl promised yesterday that he would obtain some information for several members. I think perhaps Mr. Earl could explain what results he has obtained in endeavouring to get this information. Mr. Riddel, as well, has some information.

Mr. W. RIDDEL (*Assistant Chief Commissioner, the Canadian Wheat Board*): Mr. Chairman, there are two questions with which I would like to deal. One was in connection with the special purchase of 40,019 bushels of oats, shown here at page 8. 40,000 bushels represents oats purchased from producers by one of the grain companies on a non-board basis for re-sale as commercial seed oats to other producers within the province of Alberta. The company was unable to dispose of the oats on that basis, and was given permission by the board to dispose of it outside the province. This involved delivery of the oats to the board at the initial payment price, and it was repurchased from

the board at its selling price. The item is shown as a special purchase as no producer's certificates were issued in connection with the transaction. The remaining balance of 19 bushels represents the purchase of samples.

There was another question raised by Mr. Milligan in connection with the cost of Argentine oats laid down in Montreal. We have not been able to obtain the information; however, we will try to get it and will file it with the clerk of the committee as soon as possible.

Mr. HORNER (*Acadia*): There is one other question on which I would like to obtain an answer, and it is with regard to the cost to the wheat board of the stop-overs that the railways charge to these interior terminal elevators.

Mr. McNAMARA: We will be pleased to file detailed information with the secretary in this regard.

Mr. EARL: I have the answer right here. The stop-over charge to the pools was \$166,965.

Mr. HORNER (*Acadia*): That is fine, that is what I wanted. That is to both railways?

Mr. McNAMARA: That is right.

Mr. HORNER (*Acadia*): It is spread evenly about, is it not?

Mr. EARL: No, I would not think so.

Mr. HORNER (*Acadia*): I just wanted to see what Donald Gordon was making. It is an exhorbitant charge.

The CHAIRMAN: Now, we shall turn to page 1.

Mr. EARL:

1959-60 Pool Account—

Wheat Receipts and Disposition

RECEIPTS:

Receipts of wheat in the 1959-60 Pool were 528,254,968 bushels.* This total includes 377,444,166 bushels delivered by producers between August 1, 1959 and July 31, 1960; an additional 2,314, 966 bushels acquired from others than producers; and 158,495,836 bushels transferred from the 1958-59 Pool to the 1959-60 Pool as at May 20, 1960.

*Total receipts were adjusted upward by 79,485 bushels as compared with receipts shown on Page 7 of the Annual Report of The Canadian Wheat Board for 1959-60.

DISPOSITION OF STOCKS

The disposition of stocks of wheat in the 1959-60 Pool, including completed sales, weight losses in transit and in drying, and stocks transferred from the 1959-60 Pool to the 1960-61 Pool as at May 26, 1961, is shown in the following table:

	Bushels
Domestic sales	67,041,392
Export sales on a Class II basis	68,172,075
Export sales under the terms of the	
International Wheat Agreement	243,091,906
Weight losses in transit and in drying	2,136,948
	<hr/>
	380,442,321
Transfer to the 1960-61 Pool Account—	
Wheat	147,812,647
	<hr/>
Total	528,254,968

Export and domestic sales (including weight losses) from the 1959-60 Pool amounted to 380,442,321 bushels. Of these export sales, 243,091,906 bushels were sold under the terms of the International Wheat Agreement. Domestic sales were 67,041,392 bushels. In closing the 1959-60 Pool Account, 147,812,647 bushels were transferred to the 1960-61 Pool Account, thereby accounting for a total disposition of 528,254,968 bushels for the account of the 1959-60 Pool.

Priced open sales contracts and unsold stocks in the Pool as at May 26, 1961 were transferred to the 1960-61 Pool Account. The transfer was authorized by Order in Council.

The following table shows the principal grades of wheat transferred to the 1960-61 Pool Account as at May 26, 1961:

Grade (Including Toughs)	Bushels
No. 1 Manitoba Northern	9,054,610
No. 2 Manitoba Northern	92,730,121
No. 3 Manitoba Northern	28,349,615
No. 4 Manitoba Northern	12,175,486
Other grades	5,502,815
Total	<u>147,812,647</u>

Stocks transferred from the 1959-60 Pool to the 1960-61 Pool amounted to 147,812,647 bushels. Priced open sales contracts were transferred to the 1960-61 Pool at contract prices. Remaining unsold stocks (including unpriced open sales contracts) were transferred to the 1960-61 Pool at the Board's quoted prices as at the close of business on May 26, 1961. In pricing unsold stocks of wheat the Board estimated the volume of these stocks which would be sold basis Board quoted prices (a) in store Fort William/Port Arthur, (b) in store Vancouver, and (c) in store Churchill. On the basis of this estimate unsold stocks of wheat were transferred at the Board's quoted prices for these three positions. In respect to the transfer the Board did not consider it necessary to make provision for subsequent market risk. Carrying charges subsequent to the date of transfer were fully provided for from funds allocated to the 1960-61 Pool under the Temporary Wheat Reserves Act.

Mr. RAPP: I take it that the 67 million bushels for domestic sale was not only for human consumption but included all kinds of domestic use.

Mr. McNAMARA: Yes, it also included wheat for feeding purposes.

Mr. RAPP: Do you have a breakdown of how much was sold for domestic human consumption?

Mr. McNAMARA: We have the figure showing the amount of grist to the mills, but this figure includes Ontario and other wheats, as well as western wheat.

Mr. RAPP: Could you indicate approximately what percentage was for human consumption, and what percentage was for other purposes?

Mr. McNAMARA: I think Mr. Riddel can give you some information on this.

Mr. RIDDEL: During the crop year 1959-60, the quantity of wheat used in Canada for human food was 56,491,000 bushels.

Mr. RAPP: Of which approximately 11 million went for purposes other than human consumption?

Mr. KORCHINSKI: What determines, or how would you go about determining the date on which the pool is transferred?

Mr. McNAMARA: Under the provisions of our act for the transfer, when the board is of the opinion that we have reached the point where out future commitments are such that we might close out the pool, we have the authority to do so under the act. It is a matter of judgment of the board. We have tried to close it out at about the same time each year, but this year the barley pool sales were so slow we have had to keep it open for about two months longer than normal.

Mr. GUNDLOCK: What is this 147 million bushels here? Is that wheat you have now?

Mr. McNAMARA: No. That was wheat that has been delivered to the 1959-60 pool account, including the quantity which had been transferred from the 1958-59 account that was unsold as at May 26. We purchased it from the old pool and transferred it to the new pool on that date.

Mr. GUNDLOCK: I suppose there is a total of the pool here some place.

Mr. McNAMARA: Yes. You will find it is shown under receipts and disposition as follows:

1959-60 Pool Account—Wheat

1. Receipts and Disposition

RECEIPTS

Receipts of wheat in the 1959-60 Pool were 528,254,968 bushels. This total included 377,444,166 bushels delivered by producers between August 1, 1959 and July 31, 1960; an additional 2,314,966 bushels acquired from others than producers; and 148,495,836 bushels transferred from the 1958-59 Pool to the 1959-60 Pool as at May 20, 1960.

Does that give you what you wanted, Mr. Gundlock?

Mr. GUNDLOCK: In your total disposition you have totals of everything but the 147 million bushels.

Mr. McNAMARA: That is right. We had 528 million bushels in the pool, and it was disposed of except for 147 million bushels which were transferred into the new pool.

Mr. GUNDLOCK: What is in the new pool?

Mr. McNAMARA: Grain which was delivered from August 1 1959, until July 31st of last year.

Mr. GUNDLOCK: That is what I was after. This is all the wheat you have until the new crop year comes along.

Mr. McNAMARA: We are running a year behind.

Mr. GUNDLOCK: You have last year's crop.

Mr. McNAMARA: Yes, plus this.

Mr. GUNDLOCK: Then what is the total of last year's crop?

Mr. McNAMARA: Up until June 14th, 297.6 million bushels of wheat had been delivered in this new pool. And in addition to that, we will have receipts between now and the end of July to be added to that.

Mr. GUNDLOCK: How much do you have in the terminals?

Mr. McNAMARA: The 297 million bushels are in country elevators, and our stocks in commercial position for wheat at the present time are as follows: we have in store, commercial position, as at June 14th, 397.8 million bushels of wheat. That is in country terminal elevators in Canada, off the farm.

Mr. HORNER (*Acadia*): I wonder if Mr. McNamara would explain what he means by export sales class II basis?

Mr. McNAMARA: Those are sales under the international wheat agreement to non-member countries. Russia would be included in them, as well as China.

Mr. HORNER (*Acadia*): You have sales of 68 million bushels, and then of 243 million bushels. Adding these together would put you over the 300 million bushel mark for sales, if my addition is correct, but we did not have 300 million bushels of export sales.

Mr. McNAMARA: This was during the pool period. This is not just the crop year, but up to the time we close the pool.

Mr. HORNER (*Acadia*): I see, I get it.

Mr. PASCOE: My question has been pretty well answered by the reply given to Mr. Gundlock. But on the disposition of dockage, on that basis these figures do not jive with the sales figures on page 12 of the other report. It is the same title, but with different information.

Mr. McNAMARA: The other report is up to July 31, 1960. This is up to the closing of the pool, on May 26, 1961.

The CHAIRMAN: Might I suggest that paragraph 2 on page 2 be tabled and accepted as read?

Agreed.

2. 1959-60 Pool Account—Wheat

The following table shows the operating results of the 1959-60 Pool Account from August 1, 1959 to the closing date of the Pool, May 26, 1961:

	Bushels	
1. Wheat acquired by the Board:		
(a) Producers' deliveries, August 1, 1959 to July 31, 1960.....	377,444,166	
(b) Wheat otherwise acquired ¹	2,314,966	
(c) Purchases from 1958-59 Pool Account.....	148,495,836	
Total wheat acquired.....	528,254,968	
	(Value)	(Value)
2. Cost of wheat acquired.....		\$729,647,762
3. Proceeds of sales—August 1, 1959 to May 26, 1961. Transferred to the 1960-61 Pool Account as at May 26, 1961 ²	\$597,966,860 244,403,337	842,370,197
4. Gross surplus as at May 26, 1961.....		112,722,435
5. Operating costs—August 1, 1959 to May 26, 1961:		
(a) Carrying charges on wheat stored in country elevators.....	42,865,821	
(b) Storage on wheat stored in terminal elevators.....	15,990,678

		28,921,550
6. Surplus on operations of the Board on 1959-60 Pool Account—Wheat, for the period August 1, 1959 to May 26, 1961.....		\$ 83,800,885

¹ Net bushels acquired from the adjustment of overages and shortages, etc., at country and terminal elevators at Board initial prices, basis in store Fort William/Port Arthur or Vancouver.

² For details of transfer see Page 1.

Mr. GUNDLOCK: I would like to ask my perennial question about carrying charges for wheat stored in country elevators. We just heard a figure given a while ago. What are carrying charges and storage charges?

Mr. McNAMARA: The storage is the rate of storage that we pay; it is 1/30th of a cent per bushel per day. The carrying charges include the cost of financing the grain, with bank interest paid to the banks, as well as the storage. Carrying charges include storage and interest. Storage is just storage.

Mr. GUNDLOCK: Actually then, it is just storage, and charges connected with it?

Mr. McNAMARA: No. The companies make earnings on interest, but they in turn must pay it to the banks. We in turn pay them, while they pay it to the bank.

Mr. GUNDLOCK: They have to pay interest?

Mr. McNAMARA: Yes, on country stocks, yes. They borrow money from the bank and pay interest to the bank, and we include it in our carrying charge; we include the same rate of interest that they pay to the banks.

Mr. GUNDLOCK: May I have an answer to the question this year the same as I had previously, three years ago? It was 11.9 on a percentage basis, and I got into an argument with one of the pool men here. I am afraid I must apologize at the moment because I have ten stitches in my thumb.

The CHAIRMAN: Would you please come up to the front of the room, Mr. Gundlock?

Mr. GUNDLOCK: Very well. I think Mr. Earl recognizes what I am after here.

Mr. McNAMARA: You had better read it, Mr. Earl. Is this the information you wanted?

Mr. GUNDLOCK: Yes, but I would like to have the percentage in the record; in other words, the earnings of the elevators on the wheat stored in country elevators. Three years ago it was 11.9. It was a point or two off two years ago, and it was a point or two off last year.

Mr. McNAMARA: We have the information.

Mr. GUNDLOCK: All right I will get it from you later.

Mr. EARL: I do not have that percentage calculated in that way.

Mr. McNAMARA: We will file this information now.

The CHAIRMAN: Are there any further questions on No. 2?

Mr. PASCOE: In respect of storage charges, I have a list of what the Alberta and the Saskatchewan wheat pools got. How is the figure arrived at?

Mr. McNAMARA: It is the amount they are holding in stock for us. If the Alberta wheat pool took in thirty million bushels and carried it for us, we would pay them on the amount they carried each month.

Mr. PASCOE: They receive a percentage on what they carry?

Mr. McNAMARA: No. They are paid on the total stocks they are carrying for our account. The 178 million is not related to this calculation. They get storage charges on the actual amount of grain they have in storage for our account.

Mr. KORCHINSKI: Is this paid on the basis of any particular day of the month?

Mr. McNAMARA: It is paid at the end of each month.

Mr. KORCHINSKI: On the grain they have stored at the end of that month?

Mr. McNAMARA: Yes.

The CHAIRMAN: Gentlemen, we have fifteen minutes left this morning. Would the committee be agreeable to take each of these paragraphs as read, as we come to them, and then ask questions on them? In that way there is a possibility we might finish up our work by 11 o'clock this morning.

Agreed.

The CHAIRMAN: No. 3, application of the Temporary Wheat Reserves Act.

3. Application of the Temporary Wheat Reserves Act

In each crop year during the effective period of the legislation, the Government of Canada provides funds for carrying charge purposes to the extent that the quantity of wheat upon which the Board is paying carrying charges on August 1 of each crop year is in excess of 178 million bushels on the basis of the carrying charge rates in effect immediately prior to August 1 of each crop year. On August 1, 1960 the quantity of wheat upon which the Board was paying carrying charges was 454,830,452 bushels.* This figure exceeded the basic stocks of 178,000,000 bushels by 276,830,452 bushels. Therefore, during the crop year 1960-61 the Government of Canada paid carrying charges on the latter quantity of wheat. The rate of carrying charges paid was .04991 cents per bushel per day. Funds paid or to be paid to the Board under the Temporary Wheat Reserves Act during the crop year 1960-61 amounted to \$50,430,619. The Board recommended and the Governor in Council approved the following allocation of these funds between the two operating Pool Accounts:

1959-60 Pool Account	\$37,352,386
1960-61 Pool Account	13,078,233
Total	<u>\$50,430,619</u>

The allocation of funds in 1960-61 was made on the same basis as in the previous crop year. Since stocks of wheat in the 1959-60 Pool remained in excess of 276,830,452 bushels from August 1, 1960 to January 30, 1961, all funds accrued under the Temporary Wheat Reserves Act were applied to the 1959-60 Pool Account between these dates. From January 31, 1961 to the date of the closing of the 1959-60 Pool Account on May 26, 1961 funds were allocated to the 1959-60 Pool on the basis of average wheat stocks for this period in relation to the total wheat stocks upon which carrying charges were paid under the Act. Subsequent to May 26, 1961 and up to July 31, 1961 all funds received under the Act are for the account of the 1960-61 Pool Account.

The 1959-60 Wheat Account received the following allocations under the Temporary Wheat Reserves Act:

Crop Year 1959-60	\$11,193,301
Crop Year 1960-61	37,352,386
Total	<u>\$48,545,687</u>

From August 1, 1955 to July 31, 1961 funds provided under the Temporary Wheat Reserves Act have been allocated to Pool Accounts for wheat in the following amounts:

1954-55 Pool Account	\$ 23,230,623
1955-56 Pool Account	29,191,306
1956-57 Pool Account	33,137,107
1957-58 Pool Account	39,574,057
1958-59 Pool Account	42,959,442
1959-60 Pool Account	48,545,687
1960-61 Pool Account	13,078,233
Total	<u>\$229,716,455</u>

*Confirmed by Order in Council P.C. 1960-1762, December 22, 1960.

The CHAIRMAN: No. 4, surplus for distribution to producers.

4. Surplus for Distribution to Producers

As shown in the operating statement on Page 2, the surplus on the 1959-60 Pool Account—Wheat, as at May 26, 1961 was \$83,800,885 before providing for the interim payment authorized by Order in Council P.C. 1961-195, February 13, 1961.

The interim payment involved the distribution of \$37,744,417 and was in the amount of 10 cents per bushel on all grades of wheat delivered by producers to the 1959-60 Pool.

After allowing for the interim payment, the Prairie Farm Assistance Act levy on the interim and final payments, the cost of issuing the final payment, and estimated interest earnings subsequent to May 26, 1961, the net final surplus for distribution to producers was \$45,297,017 as shown in the following table:

Surplus on operations of the Board as at May 26, 1961	\$83,800,885
Deduct: Interim payment	<u>37,744,417</u>
	46,056,468
Deduct: Prairie Farm Assistance Act levy \$838,802	
Cost of issuing final payment	<u>168,744</u>
	1,007,546
	<u>45,048,922</u>
Add: Estimated additional interest earned from May 26, 1961 to date of distribution	<u>248,095</u>
Balance for final distribution to producers	<u>\$45,297,017</u>

On producers' deliveries of 377,444,166 bushels, the average final payment was 12.001 cents per bushel. The distribution of final payment cheques to producers was authorized by Order in Council.

The CHAIRMAN: No. 5, comments on the 1959-60 pool account—wheat.

5. Comments on the 1959-60 Pool Account—Wheat

Operating costs incurred by the Board in the period from August 1, 1959 to May 26, 1961 applicable to the 1959-60 Pool were \$28,921,550, after crediting funds paid to the Board by the Government of Canada under the provisions of the Temporary Wheat Reserves Act. Operating costs consisted of the following:

(a) Carrying Charges—\$16,354,598

Total carrying charges incurred by the Board, including storage and interest charges on wheat in country and terminal elevators and in

mill positions were \$64,900,285. These carrying charges amounted to 17.1947 cents per bushel on producers' marketings of 377,444,166 bushels. Of the funds received from the Government of Canada under the Temporary Wheat Reserves Act, the sum of 48,545,687 was allocated to the 1959-60 Pool Account, or the equivalent of 12.8617 cents per bushel on producers' deliveries to the Pool. After applying these funds the actual carrying charges paid by the Board for producers' account amounted to \$16,354,598 or 4.3330 cents per bushel.

(b) *Net Interest, Exchange and Bank Charges, etc.*—\$6,400,947

This item comprises bank interest, exchange and bank charges, and interest paid to or received from other Board accounts.

(c) *Additional Freight (Net)*—\$450,868

This item consists chiefly of additional freight paid on wheat shipped from Saskatchewan stations to the Pacific Coast against the Fort William/Port Arthur freight differential and on low-grade wheat shipped from Alberta stations to the Lakehead. The item also includes freight credits on wheat shipped to Churchill.

(d) *Handling, Stop-off and Diversion Charges*—\$588,370

These charges were incurred in shipping wheat to interior terminals for storage and in diverting wheat for shipment to Churchill.

(e) *Administrative and General Expenses*—\$2,288,108

Administrative and general expenses of the Board applicable to the 1959-60 Pool Account were the equivalent of .6062 cent per bushel on producers' marketings of 377,444,166 bushels.

Mr. HORNER (*Acadia*): Would Mr. McNamara bring us up to date on the amount of wheat already exported this year, including flour?

Mr. McNAMARA: As at June 14, our export clearances of wheat, including flour, amounted to 301.2 million bushels. This compares to 244.3 million bushels at the same date last year.

Mr. HORNER (*Acadia*): We are over the 300 million bushel mark as of June 14.

Mr. McNAMARA: Yes.

Mr. HORNER (*Acadia*): This is very welcome news indeed.

Mr. NASSERDEN: What is the situation in respect of flour now on the international market?

Mr. McNAMARA: The future in respect of the export of flour is far from encouraging. There is a definite trend in many of these countries, which formerly used to import flour, to establish their own mills. While we are still doing a reasonably substantial export in the neighbourhood of 36 million bushels this crop year, we are not optimistic that we can bring this business up. It is a declining market insofar as the export of flour is concerned.

Mr. SOUTHAM: You say that up to June 14, we have sales of 301 million bushels. What do you project as to future possibilities.

Mr. McNAMARA: These are not sales; they are actually clearances. It is pretty difficult to give a definite figure. A lot will depend on the way the boats operate between now and the end of the crop year. I am satisfied, however, that our exports will exceed 340 million bushels and probably will finish in the neighbourhood of 345 million bushels. I cannot give you a definite figure, but I think it will be 345 million bushels by July 31.

Mr. SOUTHAM: I would also like to comment that this is a very optimistic situation.

Mr. McNAMARA: Yes. It will be one of our largest export years. Naturally we are prepared to take some of the credit for it, but we have had full cooperation from the various departments of government including the two ministers we have worked under. The Department of Trade and Commerce and our trade commissioners are very active. I think that this year will be very satisfactory from our viewpoint. In fairness to the committee, I should point out that this has been an abnormal year in the movement of wheat in international markets. The United States exports will be in the neighbourhood of 565 million bushels; Australia will have the largest movement on record; the Argentine position is very satisfactory. Therefore, while we are quite happy with our movement, it must be appreciated that there has been an abnormal wheat movement in the international wheat market this year.

Mr. SOUTHAM: I think Mr. McNamara and his board should be complimented on taking full advantage of the situation. They have achieved a very good record so far as this crop year is concerned.

The CHAIRMAN: No. 6, realized prices.

6. Realized Prices

The following table shows initial payments, interim payments, final payments and total prices realized by producers for the principal grades of wheat delivered to the 1959-60 Pool Account basis in store Fort William/Port Arthur or Vancouver, after deduction of net operating costs, including carrying charges, interest and administrative expenses:

	Initial Payment ¹	Interim Payment ¹	Final Payment ¹	Realized Price ¹
(dollars per bushel)

The CHAIRMAN: No. 7, board quoted prices—1959-60 pool.

7. Board Quoted Prices—1959-60 Pool

The selling operations in respect to the 1959-60 Pool covered the period of approximately one year extending from May 24, 1960 to May 26, 1961. During this period the Board continued to quote separate selling prices for wheat basis in store Fort William/Port Arthur, basis in store Pacific Coast ports and basis in store Churchill. The following table

shows monthly average Board asking prices for No. 1 Northern Wheat basis in store the positions as indicated for the marketing period of the 1959-60 Pool:

Monthly Average Asking Prices No. 1 Northern			
	Ft. Wm./Pt. Ar.	Vancouver	Churchill
	(dollars per bushel)		
May 24-31, 1960.....	1.69 $\frac{1}{2}$	1.76 $\frac{1}{2}$	1.77 $\frac{1}{2}$
June.....	1.68 $\frac{1}{2}$	1.75	1.76 $\frac{1}{2}$
July.....	1.66 $\frac{1}{2}$	1.74 $\frac{1}{2}$	1.75 $\frac{1}{2}$
August.....	1.65 $\frac{1}{2}$	1.72 $\frac{1}{2}$	1.73 $\frac{1}{2}$
September.....	1.65 $\frac{1}{2}$	1.73 $\frac{1}{2}$	1.73 $\frac{1}{2}$
October.....	1.65	1.75 $\frac{1}{2}$	1.73 $\frac{1}{2}$
November.....	1.64 $\frac{3}{4}$	1.74 $\frac{1}{2}$	1.72 $\frac{1}{2}$
December.....	1.65 $\frac{1}{2}$	1.76	1.73 $\frac{1}{2}$
January, 1961.....	1.67 $\frac{1}{2}$	1.77 $\frac{1}{2}$	1.75 $\frac{1}{2}$
February.....	1.67 $\frac{3}{4}$	1.75 $\frac{1}{2}$	1.75 $\frac{1}{2}$
March.....	1.67	1.75 $\frac{1}{2}$	1.75 $\frac{1}{2}$
April.....	1.67 $\frac{1}{2}$	1.75 $\frac{1}{2}$	1.75 $\frac{1}{2}$
May 1-26.....	1.67	1.75 $\frac{1}{2}$	1.75 $\frac{1}{2}$

As shown by the foregoing table Board asking prices for No. 1 Northern Wheat fluctuated within narrow limits during the selling period of the 1959-60 Pool Account. Price changes were largely in terms of adjustments to the exchange value of the Canadian dollar and adjustments as between Board selling prices for wheat basis in store Fort William/Port Arthur and basis in store Vancouver. Asking prices for wheat in store Vancouver and Churchill continued to reflect lower forwarding costs to overseas destinations as compared with shipments from the Lakehead via St. Lawrence ports and Atlantic Maritime ports.

The Board continued to quote daily prices for wheat c.i.f. St. Lawrence ports and to provide for the quotation of prices at intermediate Seaway ports as required.

Reflecting grade availabilities in relation to demand, important changes were made in discounts for No. 2 Northern, No. 3 Northern and No. 4 Northern Wheat relative to asking prices for No. 1 Northern. The selling discount for No. 2 Northern Wheat was increased from 4 $\frac{1}{2}$ to 5 cents per bushel in June, 1960, and continued at this spread until February, 1961, when the discount was reduced to 4 cents per bushel. In March, the selling discount for No. 2 Northern Wheat was narrowed to 3 cents per bushel and remained at this level until the closing date of the Pool. During the selling period of the 1959-60 Pool the discount for No. 3 Northern Wheat was narrowed at intervals from 9 cents per bushel to 5 cents per bushel. Similarly, the selling discount for No. 4 Northern Wheat narrowed from 14 cents per bushel in May, 1960 to 7 cents per bushel in March, 1961. In the final month of the Pool this discount was widened to 10 cents per bushel. Selling discounts applicable to No. 5 and No. 6 Wheat were also narrowed.

During the selling period of the 1959-60 Pool an active demand developed for Durum grades of wheat. The following table shows monthly average Board asking prices for No. 1 Canada Western Amber Durum, together with the high and low prices recorded monthly for the period from May 24, 1960 to May 26, 1961:

	High	Low	Average
	(dollars per bushel)		
May.....	1.80 $\frac{7}{8}$	1.80 $\frac{1}{4}$	1.80 $\frac{1}{2}$
June.....	1.80 $\frac{1}{4}$	1.79	1.79 $\frac{1}{2}$
July.....	1.79 $\frac{3}{8}$	1.76 $\frac{7}{8}$	1.78 $\frac{5}{8}$
August.....	1.78 $\frac{1}{2}$	1.74 $\frac{1}{2}$	1.76 $\frac{5}{8}$
September.....	1.79	1.77 $\frac{1}{2}$	1.77 $\frac{1}{2}$
October.....	1.79 $\frac{3}{4}$	1.78 $\frac{3}{4}$	1.79 $\frac{1}{8}$
November.....	1.79 $\frac{1}{8}$	1.78 $\frac{1}{8}$	1.78 $\frac{1}{8}$
December.....	1.82 $\frac{1}{2}$	1.78 $\frac{1}{2}$	1.80
January, 1961.....	1.82 $\frac{1}{2}$	1.81 $\frac{1}{2}$	1.82
February.....	1.82 $\frac{5}{8}$	1.81 $\frac{1}{2}$	1.82 $\frac{1}{2}$
March.....	1.84 $\frac{1}{2}$	1.82 $\frac{1}{2}$	1.83 $\frac{1}{2}$
April.....	1.85 $\frac{1}{4}$	1.83 $\frac{3}{4}$	1.84 $\frac{5}{8}$
May.....	1.89 $\frac{1}{8}$	1.85 $\frac{5}{8}$	1.88 $\frac{5}{8}$

Board asking prices for No. 1 Canada Western Amber Durum fluctuated within narrow limits during the period from May through December; a period of heavy trading in Durum grades. Reflecting diminishing supplies of Durum grades of wheat, prices advanced steadily in the final five months of the Pool. During the selling period of the 1959-60 Pool, discounts under Board asking prices for No. 1 Amber Durum applicable to No. 2, No. 3, No. 4 and Extra No. 4 Canada Western Amber Durum were narrowed significantly.

Mr. McNAMARA: For the information of the committee I might mention that our final payment distribution started yesterday in Winnipeg and the cheques are now going out to the producers.

Mr. HORNER (*Acadia*): Over the year it has been the practice to quote prices fairly low for 5 and 6 wheat, and then when the final payment comes in most of the time there is a larger payment. This happened again this year. There was a larger payment for 5, 4 and 6 wheat. Do you not think it might be a little more advantageous to the farmers if they were quoted this higher price rather than having a big price spread in the initial price and having it made up at the end. The farmer would have a better understanding of where he stands.

Mr. McNAMARA: I cannot quite agree with you. I will take you back to five years ago. At that time we had very great difficulty in selling low grade wheats, which were in abundance, at a price which would result in any final payment. The fact is that now we are short of supplies, deliveries are relatively low and the demand is good; but, at the time of setting the initial payment it is pretty difficult to forecast what the quality of the new crop will be. Frost could give you an abundance of low grade wheat. In order to merchandise it, we would have to widen the spread considerably. I suggest it would be wrong to narrow these spreads before we know what the volume will be. If we over-pay, then the cost is borne by the producers who deliver the higher grade wheat.

Mr. HORNER (*Acadia*): This question has been asked several times and that is why I have brought it up.

The CHAIRMAN: We will go on to No. 8, exports, and No. 9, general comment.

8. Exports

The following table shows the exports of Canadian wheat and flour for the period from June, 1960 to May, 1961. This period corresponds approximately to the selling period of the 1959-60 Pool Account. Export statistics for the corresponding months of the previous year are also shown.

	1960-61 ¹	1959-60
	(Million bushels)	
June, 1960	24.4	30.9
July	17.6	19.8
August	26.9	24.5
September	29.7	25.6
October	25.1	26.3
November	28.2	32.9
December	24.0	24.3
January, 1961	21.0	16.6
February	24.1	20.0
March	26.2	20.8
April	34.5	19.5
May	45.9	25.0
	<hr/>	<hr/>
	327.6	286.2
	<hr/>	<hr/>

Exports of wheat (including flour) for the period from June, 1960 to May, 1961 were 327.6 million bushels as compared to 286.2 million bushels for the corresponding months of the previous year. In the period from May, 1960 through December, 1960 exports of wheat were comparable with exports of the previous year. Commencing in January, 1961, exports showed substantial increases over the corresponding months of the previous year and were exceptionally large in May, 1961.

¹ Subject to revision.

9. General Comment

The distribution of world wheat production in 1960 led to an increase in international trade in wheat. Both Eastern and Western Europe harvested smaller wheat crops and yields in Southern Europe were sharply lower than in the previous year. In addition, Europe experienced a wet harvest which reduced the quantities of domestic wheat available for milling. Drought again affected yields in the Middle East. Production was well maintained in Japan, India and Pakistan but was not sufficiently large to reduce deficits in the supply of bread grains. On balance, the deficit areas of the world collectively needed more wheat than in the previous crop year and, therefore, world trade for 1960-61 was estimated at a record of about 1,400 million bushels.

Wheat production in the main exporting countries increased, particularly in the United States. At the same time these countries had the advantage of larger market opportunities. This was particularly helpful to Canada, the United States and Australia. Argentina was not in a position to take advantage of increased demand because of a short crop.

Within the international pattern, as described, three developments were helpful to Canada. These were:

- (1) As a result of reduced availability of Durum Wheat in Europe, the Middle East and North Africa, a keen demand for this type of wheat arose in the summer of 1960 and continued steadily throughout the crop year. The demand was sufficient to justify open delivery quotas for Durums and during the June-May period, 1960-61, producers delivered about 30 million bushels. During the same months exports were about 39 million bushels. Thus, both the carried-over stocks of Durum Wheat and the surplus from the 1960 production found a ready market.

- (2) Early in 1961 the People's Republic of China entered the market for large quantities of Canadian and Australian wheat. In the five-month period from January, 1961 through May, 1961, export clearances of Canadian wheat to China amounted to 19.6 million bushels.
- (3) In addition to the foregoing special demands, traditional importing countries maintained the level of their imports.

As a result of these developments exports of Canadian wheat and flour for the first ten months of the crop year 1960-61 amounted to 285.6 million bushels as compared with 235.5 million bushels during the corresponding months of the previous crop year.

Mr. KORCHINSKI: I would like to ask Mr. McNamara to make one comment because of a ridiculous editorial which appeared in the *Globe and Mail*. I do not know why they do not stick just to advertising. The particular part of the editorial to which I refer says that the quality of Canadian wheat has gone down and the quality of foreign grown wheat especially has improved. Then they go on to say that we should reduce prices; that is the ridiculous part of it. Would Mr. McNamara make a comment on the quality of foreign grown wheat and also in respect of the new milling methods which were also mentioned in the article. Would he tell us how this affects our overall prospects?

Mr. McNAMARA: We attempted to answer part of this article yesterday in our statement regarding board pricing policy. It is quite obvious that the writer of this article knows nothing about international marketing. In respect of the statement about Canadian wheats deteriorating, the fact is completely the reverse. During the last few years the quality and the protein content of our wheat has been most satisfactory. Canadian wheat is appreciated and valued in every market of the world. I am satisfied that in nearly all countries, if millers were given freedom and allowed to purchase what they wanted, and were not forced to use indigenous wheats, we could materially increase the volume of our sales in these markets because our quality is appreciated. This is the one thing we have to sell which nobody else in the world has; they cannot compete with us. It is our valued asset.

Mr. KORCHINSKI: I would particularly like you to comment on the suggestion that because of new milling methods they can apparently use wheat which is not perhaps of as high a quality as ours.

Mr. McNAMARA: Most of this reference to new milling methods is propaganda put out by some of our competitors who are having difficulty competing in respect of quality. As I indicated, under our new marketing research development section, we are sending experts into the field to demonstrate how to use Canadian wheat to the best advantage. These specialists report that actually in the new methods of baking the quality of Canadian wheat is even more appreciated than it was under the old method.

Mr. BOULANGER: Last night you said that the eastern farmers were not organized in the buying of grain and were behind twenty-five years.

Mr. McNAMARA: At least.

Mr. BOULANGER: I would like to ask you what the wheat board could do to help the eastern farmers and what would be your recommendation?

Mr. McNAMARA: I think that the responsibility for the purchasing lies with the consumers. I do not think this is a responsibility of the board, except that as merchandisers of grain we are very interested in seeing that the eastern consumer buys to the best advantage and that the margin between the selling price of the board and the price the consumer has to pay is kept to a minimum. I believe that by more competent methods, such as purchasing or buying grain in volume and being sure it is moving under the most

economical routing, that in this way the margin can be narrowed considerably between what the western producer receives and the price which the eastern consumer is paying.

Mr. BOULANGER: Did you say that the Canadian federation of agriculture was ready to lend money?

Mr. McNAMARA: It is my understanding that western members of the federation have discussed this on occasion with the eastern members and have pointed out that they thought the eastern consumer could improve his purchasing methods. I was not there, so I cannot make the statement on any authority, but it is my understanding that the western representatives on one occasion agreed to assist in the financing of some facilities which they thought would be beneficial to the eastern consumers. I believe they said that they would go in with them as partners for a period of time. So far that invitation has not been accepted by the eastern consumers.

I think this is something which could be considered by the committee which the minister is going to appoint on which our board will be represented, along with three selected representatives from the eastern consumers.

Mr. BOULANGER: Would you recommend that the minister nominate men who would be bilingual?

Mr. McNAMARA: I certainly hope they would be bilingual, because I cannot speak French. I am sure you can have complete confidence that Mr. Hamilton will select a very competent representative of the eastern consumers to be associated with this advisory committee.

The CHAIRMAN: Gentlemen, before we wind up, we have to deal with the auditors report and the financial statement. It is agreed that these be accepted as read?

Agreed.

Auditor's Report
MILLAR, MACDONALD & CO.
Chartered Accountants

To The Canadian Wheat Board,
Winnipeg, Manitoba.

We have examined the Statements of Operations of The Canadian Wheat Board which set forth the results of the Board's operations on 1959-60 Pool Account—Wheat for the period from 1st August 1959 to 26th May 1961, 1959-60 Pool Account—Oats for the period from 1st August 1959 to 27th January 1961, and 1959-60 Pool Account—Barley for the period from 1st August 1959 to 30th March 1961, and have obtained all the information and explanations we have required. Our examination included a general review of the accounting procedures and such tests of accounting records and other supporting evidence as we considered necessary in the circumstances.

In our opinion and according to the best of our information and the explanations given to us and as shown by the books of the Board, the accompanying Statements of Operations are properly drawn up so as to exhibit a true and correct view of the results of the operations of The Canadian Wheat Board on 1959-60 Pool Accounts—Wheat, Oats and Barley for the periods indicated above, in accordance with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

MILLAR, MACDONALD & CO.

Winnipeg, Manitoba,
16th June, 1961.

		<u>\$ 2,082,085</u>

The CHAIRMAN: Gentlemen, that concludes the annual report and the supplementary report of the Canadian wheat board. I am sure we have appreciated the reports which have been given us this year. We hope that the weather is more favourable for growing conditions out west than it has been in the past few weeks. We hope, Mr. McNamara, that when you get back you will find showers over the prairies.

APPENDIX "B"

STATEMENT RE FEED MILLS

On November 30th the Wheat Board announced the commencement of a new policy in respect to Feed Mills. In essence, the policy provided for the exemption of permit holders from delivery quota regulations insofar as they applied to their deliveries of feed grains to Feed Mills designated by the Board as "Non-Quota" Feed Mills.

The policy was not one which was decided hurriedly or without due consideration. The Board was influenced by its experience over the preceding several years in endeavouring to administer delivery quotas insofar as some 175 Feed Mills in the Prairie Provinces were concerned. From 1957 until 1959 the Board could not proceed with the administration of delivery quotas in respect to Feed Mills because of cases that were before the Courts during this period. While the Court cases were resolved in favour of the Board and its powers to administer delivery quotas in respect to Feed Mills, we still faced the administrative problem of enforcing delivery quotas insofar as they applied to Feed Mills. In 1959, and again in 1960, the position of Feed Mills was the subject of discussion and recommendation on the part of the House of Commons Standing Committee on Agriculture and Colonization. The Board gave consideration to the findings of the Standing Committee and certainly these findings were a factor in the decision reached by the Board. For your information I might read the 1959 and 1960 findings of the Committee.

One of the most cogent reasons for the Board decision was the fact that Feed Mills in the designated area carry out, in the main, a local operation. They acquire feed grains from producers and manufacture prepared feeds for sale to livestock producers in the area in which they operate. Therefore, the Board felt that this was a type of operation which could be worked out within local areas without the intervention of Board powers primarily directed to the interprovincial and export movement of grain. This latter field is the all-important one as far as the Wheat Board is concerned and it is this field in which the Board must concentrate its efforts. In the opinion of the Board, the new Feed Mill policy does not interfere with the major objectives of the Board and the system of controlled marketing in which we are engaged.

Having reached the decision that more freedom of action should be extended to producers delivering grain to Feed Mills, the question of the means became important. There were two courses of action which might have been followed. The Wheat Board might have recommended to the Government that it consider amending the Canadian Wheat Board Act to remove Feed Mills from the terms of the Act. This course was not followed. In all discussions within the last year or more no one has suggested that this course of action should be followed.

It was felt that Feed Mills should be kept within the scope of the Canadian Wheat Board Act. Therefore, the Board decided that the new Feed Mill policy could be put into effect by exempting producers from delivery quota regulations insofar as their deliveries to designated Feed Mills were concerned.

In working out the details of the policy, care was taken not to prejudice future policy and the Agreements which the Board has entered into with Feed Mills are on an annual basis.

Under the Agreements which we have entered into, Feed Mills are required to report the volume of their purchases from permit holders, and by July 31st next, or shortly thereafter, we will have at our disposal the first comprehensive information available as to the volume of grain which is involved in the feedstuffs industry of the Prairie Provinces. This information will be helpful in future policy decisions.

It was not unexpected that the Feed Mill policy announced by the Board would be subject to some criticism. Up to the present time that criticism has followed two main directions. There are those who say, in good faith, that the non application of delivery quota regulations to Feed Mills prejudices the over-all system of controlled marketing built up in this country over the past quarter of a century. This must remain a matter of opinion.

The second criticism has been in the field of prices paid by Feed Mills for grain purchased by them from permit holders. In this field of price, no great change was involved in the new Board policy because most feed plants were not Agents of the Board; were operating entirely within their respective provinces and could purchase feed grains from producers at negotiated prices. The change which was involved was that feed plants which formerly operated in a disadvantageous position as Agents of the Board were given the right to purchase feed grains from permit holders at negotiated prices, thereby removing the element of discrimination which the Agricultural Committee had noted.

There is one final observation which should be made. For many years now there has been within each of the Prairie Provinces a local market for feed grains as between producers and as between producers and feed lots. Producers within their province have always had the right to negotiate sales of grain in these categories with buyers.

There may be room for confusion between these local farm to feeder transactions and prices which are offered to permit holders by Feed Mills. Obviously, Feed Mills are effected by prices at which producers sell feed grains to their neighbours; to feeders and to feed lots. However, the Feed Mills are rapidly moving into the position where their buying prices will be a matter of public knowledge and producers can exercise their judgment as to whether they should offer feed grains to Feed Mills or await marketing opportunity through deliveries to the Board.

There is a long range viewpoint behind the new policy. As long as we have surplus conditions in Canada, surely it is advisable that the local use of grain in the production of livestock should be encouraged. We believe this development will take place slowly if producers, manufacturers of modern prepared feeds, and livestock producers are allowed to work out the problem of local distribution of feeds.

In the opinion of the Board, the new Feed Mill policy should be given a trial. With experience under the new plan, with more information as to the extent of Feed Mill operations, we will all be in a better position to assess the step which has been taken and the direction which future policy should take.

February 1st, 1961.

PARLIAMENTARY REPORTS RELATING TO FEED MILLS 1959 SESSION

In the Third Report of the Standing Committee on Agriculture and Colonization, under date of July 15, 1959 the following recommendation was made:

The Committee further recommends that the whole question of feed mills and their position in the grain trade should be clarified and, if necessary, new legislation introduced.

1960 SESSION

Under date of June 27, 1960 the Second Report of the Standing Committee on Agriculture and Colonization read as follows:

On March 9, 1960, the Committee was empowered to examine and enquire into the delivery of grain by producers to feed mills operating in the designated area as defined by the Canadian Wheat Board Act, and to report to the House observations and proposals thereon.

During the consideration of the above-mentioned Order of Reference, this Committee has held 14 sittings and heard evidence on the subject from the following:

1. The Canadian Wheat Board
2. The Board of Grain Commissioners
3. Alberta Wheat Pool
4. Rural Custom Feed Mills
5. Interprovincial Farm Union Council
6. Canadian Feed Manufacturers' Association
7. Saskatchewan Wheat Pool
8. United Grain Growers
9. Council of Canadian Beef Producers (Western Section)

Your Committee wishes to express its appreciation for the information and assistance tendered by the various witnesses.

The Committee finds that:—

1. The feeds industry is an integral and essential part of livestock industry and feed mills perform necessary social and economic services, expansion of which in the Prairie Provinces is desirable in the interests of economical and efficient production of livestock and poultry and the products thereof;
2. The feed industry has grown, and aided the general prosperity of local regions under a system of flexibility and the Committee finds that too much inflexibility in the allocation of quotas to feed mills is not in the best interest of either the producer or consumer of grains for feed. We, therefore, recommend that the former practice be continued.
3. Evidence was presented to the Committee that apparent discrimination exists between agreement and non-agreement mills and the Committee recommends that this situation be studied in order to maintain a fair position between these two types of mills.

A copy of the Committee's Minutes of Proceedings and Evidence is appended.

THE CANADIAN WHEAT BOARD

INSTRUCTIONS TO THE TRADE

No. 43

1960-61 Crop Year

Attention All Companies:

Dear Sirs: Re: *Order re Delivery of Grain to Feed Mills*

Whereas Section 16 of the Canadian Wheat Board Act provides that:

".....except with the permission of the Board, no person shall deliver grain to an elevator, and no manager or operator thereof shall receive delivery of grain unless—

- (a) the person delivering the grain is the actual producer of, or is entitled as a producer to the grain;
- (b) at the time of delivery the person delivering the grain produces to manager or operator a permit book under which he is entitled to deliver the grain in the crop year in which delivery is made;
- (c) the grain was produced in the crop year in which delivery is made on the lands described in the permit or in any other crop year on any lands whatsoever;

- (d) the grain is delivered at the delivery point named in the permit book; and
- (e) the quantity of grain delivered, whether sold, or delivered for storage, together with all grain of the same kind previously delivered under the permit book during the crop year in which delivery is made, does not exceed the quota established by the Board for such delivery point for grain of the kind delivered at the time it is delivered."

And whereas the elevators referred to in the Schedule to this Order have made application to the Board to be permitted to receive grain from the producers thereof as hereinafter authorized, and have given to the Board appropriate assurances relating to the handling of such grain.

Now, therefore, The Canadian Wheat Board doth hereby order:

Instruction to the Trade No. 43

- (1) pursuant to Section 16 aforesaid, each producer is hereby granted permission to deliver, and the manager operator of each of the said elevators is hereby granted permission to receive grain from the producer thereof without complying with the above quoted subsections (d) and (e) of Section 16 aforesaid.
- (2) this Order shall expire on the 31st day of July, 1961.

Yours very truly,
THE CANADIAN WHEAT BOARD,
Approved for the Board by:
W. C. McNamara
Chief Commissioner.

DESIGNATION OF NON-QUOTA FEED MILL

Application

The undersigned Manager, or Owner, of a Feed Mill located at

and known as

Station	Province	Name of Mill
---------	----------	--------------

hereby makes application for designation of the said Feed Mill by the Canadian Wheat Board as a "Non-Quota Feed Mill" until July 31st, 1961, for the purpose of;

- (1) providing for the acceptance into the said Feed Mill of producers' grain which is exempted from delivery quota regulations established under authority of the Canadian Wheat Board Act, and which is (a) produced within the province in which the said Feed Mill is situated and (b) received into the said Feed Mill for processing into feedstuffs for sale within the said province;
- (2) providing, where appropriate, for the right to purchase such grain from producers for the account of the said Feed Mill at prices negotiated with the producers concerned.

Undertaking

If the aforesaid designation is granted by the Board, the undersigned Manager, or Owner, undertakes on behalf of the said Feed Mill as follows:

- (1) to purchase for the account of the said Feed Mill quota-exempted grain and, unless otherwise authorized by the Board, to purchase such grain from Permit Holders located in the province in which the said Feed Mill is situated;
- (2) to sell such grain within the said province unless otherwise authorized by the Board, and to sell such grain solely in the form of prepared or processed feedstuffs;

- (3) to store separately and preserve the identity of grain purchased (a) for the account of the said Feed Mill and (b) for the account of The Canadian Wheat Board;
- (4) to maintain records, satisfactory to the Board, of purchases of grain from Permit Holders for the account of the said Feed Mill, and on request make such records available for inspection by authorized employees of The Canadian Wheat Board;
- (5) to submit to the Canadian Wheat Board on or before January 15th, 1961, a return, on a form prescribed by the Board, showing total purchases of wheat, oats and barley for the account of the said Feed Mill for the period August 1st, 1960 to December 31st, 1960, and a further return, on a similarly prescribed form, on or before the 15th day of August, 1961, setting forth the total purchases of wheat, oats and barley from Permit Holders for the account of the said Feed Mill during the period from January 1st, 1961 to July 31st, 1961.

DATED THIS _____ day of _____ A.D. 1960.

THE CANADIAN WHEAT BOARD
 INSTRUCTIONS TO THE TRADE

No. 41

Attention all Companies:

Dear Sirs:

Re: Feed Mills

The Board today announced provisions whereby 1960-61 Delivery Permit Holders will be authorized to deliver, outside delivery quota regulations, supplies of wheat, oats and barley to designated Feed Mills. The designated Feed Mills will be those Mills which complete an Agreement with the Board, effective until July 31st, 1961, and which will be named in an Order of the Board to be issued at an early date. In general terms, the Agreement provides that designated Feed Mills may receive quota-exempt wheat, oats and barley from 1960-61 Permit Holders in the province in which the Feed Mills is located. Wheat, oats and barley will be purchased by designated Feed Mills for their own account at prices negotiated with Delivery Permit Holders. Wheat, oats and barley so acquired must be re-sold by contracting Feed Mills solely in the form of prepared or processed feedstuffs within the province in which the Feed Mill is situated. Feed Mills participating in the arrangement will be required to maintain records which are satisfactory to the Board and to submit reports of purchases as required by the Agreement.

Agreements are being forwarded today to all Feed Mills in the prairie provinces. When the Agreements are signed and returned to the Board, an Order of the Board will be issued designating signatory Feed Mills as "Non-Quota Feed Mills". On designation, such Feed Mills may receive from 1960-61 Delivery Permit Holders, and 1960-61 Delivery Permit Holders may deliver to such Feed Mills, wheat, oats and barley, and any such receipts and deliveries will be exempt from delivery quota regulations.

Yours very truly,

THE CANADIAN WHEAT BOARD,

Approved for the Board by:

W. C. McNamara,
 Chief Commissioner.

Reference:

C. A. McLean.

November 30th, 1960.

Clerk of the Committee.

REPORT TO THE HOUSE

September 26, 1961.

The Standing Committee on Agriculture and Colonization has the honour to present the following as its

THIRD REPORT

Your Committee has investigated the following aspects of farm machinery prices:

1. Costs of manufacturing farm machinery, including labour (wages and salaries), materials, overhead and profits;
2. Costs of distributing farm machinery, including the margins earned by dealers and transportation costs;
3. Other costs of ownership of farm machinery, such as charges for credit;
4. The organization of the farm machinery industry and market in North America.

The points of view of farm organizations, labour organizations, the farm machinery manufacturers and others with respect to the price of farm machinery have been placed on the records of your Committee.

Your Committee reports that it has met 32 times and feels, due to the wide scope of the questions considered, further study is necessary to determine the effect on the prices of farm machinery and repairs of the following:

- (a) If farmers are receiving the full advantage of a free trade market in farm machinery
- (b) Cost of distribution of farm machinery
- (c) Cost and standardization of parts
- (d) Standardization of farm machinery
- (e) Credit arrangements
- (f) The reluctance of machine manufacturers to provide details of their costs, which are regarded as being of a competitive nature
- (g) Different opinions of the witnesses as to the productivity of labour as compared to increase in wages.

Further study is also required because of the following:

- (a) The necessity of recalling some witnesses
- (b) Other witnesses yet to be heard.

Your Committee wishes to express its appreciation to all those who presented evidence and for the services of Mr. Gordon Haase, Economist, Department of Agriculture.

In view therefore of the present status of its enquiry, your Committee accordingly recommends:

1. That the subject of farm machinery prices be referred to it as soon as possible after the opening of the next session of Parliament;

2. That the Ministers of the different government departments concerned instruct their officers to offer every assistance to the persons designated by the Committee to procure and compile all available facts regarding farm machinery prices.

3. That the government send a fact finding group abroad, or use any other practical means to gather information on farm machinery as to (a) Prices dealers pay abroad for goods that come from production centres which also supply Canada, (b) Distribution costs and credit assistance given in other countries in regard to purchasing.

A copy of the Minutes of Proceedings and Evidence is appended hereto.

Respectfully submitted,

JAMES A. MCBAIN,
Chairman.

(Reprint of meeting appearing in
No. 16 at page 1307)

MINUTES OF PROCEEDINGS

WEDNESDAY, June 21, 1961.
(32)

The Standing Committee on Agriculture and Colonization met, *in camera*, at 3.00 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Clermont, Danforth, Fane, Forgie, Gundlock, Henderson, Hicks, Horner (*Acadia*), McBain, Mandziuk, Muir (*Lisgar*), Nasserden, Rapp, Smallwood, Southam, Thomas, Thompson, Tucker, and Webb—(20).

The Committee considered, amended and adopted a draft report on farm machinery prices for presentation to the House.

At 3.30 p.m. the Committee adjourned until Friday, June 24, at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.
